## Welcome to the Delphix Continuous Data documentation!

Here you will find all the information you will need to use the Delphix Continuous Data Engine for data virtualization. Learn how to deploy our application, use our features, or tune it for optimal performance. We have organized this content into several categories that you can browse via the navigation bar.

## Release notes

This section covers the following topics:

- [New features](#)
- [API changes](#)
- [Support matrices](#)
- [Migration and compatibility](#)
- [Fixed issues](#)
- [Known issues](#)
- [Deprecated and end-of-life features](#)
- [Licenses and notices](#)
- [Data source integration \(plugin\) release notes](#)

## New features

### Release 10.0.0.0

- **Azure key vault integration**

This release adds Azure Key Vault support for storing and accessing secrets, keys, and certificates necessary for Continuous Data operations.

### Release 9.0.0.0

- **READ\_COMMITTED\_SNAPSHOT parameter can now be set during VDB provisioning**

This feature allows the SQL Server *READ\_COMMITTED\_SNAPSHOT* database parameter to be defined during VDB Provision operations, either by specifying it as a VDB Configuration Parameter or associating the VDB with a VDB Configuration Template. If defined, the parameter will be automatically set during Provision, Refresh, and Rewind operations for the VDB.

- **Export an Oracle virtual DB or virtual PDB to a physical Oracle ASM or Exadata database**

This feature enables you to export data from an Oracle Virtual database (VDB) or a Multi-Tenant (MT) VPDB to a physical Oracle database that uses Automatic Storage Management (ASM). This feature is especially useful for Oracle target environments running on Exadata or ExaCC systems.

### Release 8.0.0.0

- **Oracle: Multiple virtual PDBs in a virtual CDB**

This feature enables you to provision and manage multiple Oracle virtual PDBs to a virtual CDB (vCDB).

- A vCDB is a Delphix-managed, fully compatible Oracle Container Database created and maintained by Delphix as part of the VDB provisioning workflow. This workflow allows organizations to automate their Oracle data lifecycle end-to-end, which results in developer productivity enhancements. Additionally, because container databases allow it, Oracle users benefit from the Oracle licensing agreement (which allows hosting up to three PDBs inside a vCDB).

 This feature is only supported for Oracle versions 12.1.0.2 (with a patch for Oracle bug 18967466) and later.

- **Source sizing for HANA**

This feature enables you to calculate the source dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset.

- **Support for multiple backup paths in DB2**

This feature supports multiple backup paths instead of one for dSource ingestion. This allows you to provide a single backup path for the dSource ingestion and add more backup paths with a dynamic UI to accommodate for the extra backup directories where the backup was split into.

### Release 7.0.0.0

- **Oracle: Multi-Tenant TDE for VCDBs**

Use transparent data encryption (TDE) with virtual container databases to secure data-at-rest. Existing TDE keys can be used or data can be rekeyed upon deployment. Automated KeyStore sanitization ensures production TDE keys are not shared to non-production environments.

- **Oracle: staging push**

Pushes new data to the Delphix DevOps Data Platform instead of requesting data on a polling interval. Isolate ingests to Delphix from production instances. Gives the ability to leverage third-party backup

applications. Full-tested integration with Oracle Data Guard and Active Data Guard allows for staging DB to be the standby DB, enabling tight point-in-time snapshots.

- **Cassandra: new Continuous Data connector**

Continuously sync to Cassandra databases and deploy data to non-production environments. Deploy data from multiple Cassandra nodes as a single virtual database. Track source changes along a continuous time flow and redeploys data from any time. Quickly deploy data to new ephemeral instances. Branch production data, apply data masking, and deploy to new developer sandbox environments.

 Multiple Device Removal for Delphix Engines version 6.0.12.0 to 6.0.17.X contains a breaking kernel module change that requires a reboot in order for the new module to load. With that, a deferred reboot engine upgrade operation will be unable to remove devices until a reboot is performed.

## Release 6.0.17.0

- **Source sizing for Postgres and IBM Db2**

This feature brings improved visibility for data source ingest management and metrics with data source size information logs. The source volume sizes can now be viewed through engine APIs and easily integrate with automation scripts.

- **Environment variables in hooks**

This feature allows users to customize data deployments with hook scripts using environment variables, defined by plugin connectors in DLPX\_DATA\_DIRECTORY. Automated hook scripts can be executed during pre and post-deployment.

## Release 6.0.16.0

- **Cloud engines on Microsoft Azure**

You can now use Azure Blob object storage in place of block storage to reduce operational costs. Cache only necessary data to engines in order to maintain consistent VDB performance. Allows for elastic expansion of your storage footprint as-you-go in the cloud. Quickly deploy data to engines across regions, combining these tools to achieve potential cost savings of 25%-80% depending on use and workloads.

- **Cloud engines cache resize**

This feature allows your Cloud Engine cache to meet changing cost-performance demands on-the-fly by fine-tuning cache ratios for data ingestion and distribution use cases. Adapt to different workloads, saving costs during idle situations and delivering high performance during heavy workloads.

- **Continuous Vault: additional security controls**

New security controls are introduced for Ransomware Protection when using [Delphix Continuous Vault](#). Alert Profiles, dSources, and LogSync profiles can now be locked on Continuous Data Source Engines. Delphix Continuous Ransomware Protection Solution provides Continuous Data Protection, Recovery, Detection, and Compliance.

- **Non-admin user password reset**

Non-admin users will be able to request a password reset if an email is associated with the account. The password reset will continue to be controlled through LDAP/SSO for users on IdP platforms. Self-service password reset is available both within the UI and CLI.

- **Zero trust update for SAP HANA connector**

A “least-privileged” OS user can now be used to run virtualization operations on a Delphix target host. Aligning with Zero Trust initiatives, Delphix no longer requires a high-level OS user for virtualization.

- **Increased mount security**

This change brings improved security controls that limit connections to Delphix Engines only from a defined host list. NFS mount checks will now run on ephemeral mount points matched to specific host UIDs. Mount checks are used to verify that the Continuous Data Engine is mountable before running virtualization operations.

- **iSCSI parameter warnings**  
New warning to ensure iSCSI parameters on Windows Targets are optimized for Delphix Engines. The check runs for Target environments during Add, Refresh, and Enable operations.
- **Database port customization for EBS plugin**  
This feature supports the provisioning of VDBs in EBS dbTechStack & AppsTier plugins to run on a customized port. You can now provision database binaries(ORACLE\_HOME) cloning and listener process to run on a custom DB port and Application tier to connect to that port.

## Release 6.0.15.0

- **Oracle MT TDE for system tablespaces**  
The next release enables system tablespaces on Oracle Virtual Databases to be encrypted using transparent data encryption (TDE). Oracle system tables store database table information, index, sequences, and other objects. Encrypting system tables in non-prod environments enforce security controls and prevents database index and metadata tampering.
- **Staging push for Postgres**  
Staging push enables organizations to push data into Delphix without having to directly query production instances. With staging push, teams can use 3rd party solutions to recover data to staging instances that automatically sync to Continuous Data. This also enables logical replication workflows (common for PaaS sources) and the use of tools like pgbackrest.
- **Staging Push for IBM Db2 HADR**  
Staging push will be added in the next release for IBM Db2 in a High Availability Disaster Recovery (HADR) configuration. This gives teams an alternative way to sync data into the Continuous Data.
- **Cache analysis for cloud engines**  
We plan to add a UI for teams to better understand the effectiveness of allotted Delphix Cloud Engine cache size. This enables users to optimize DCE cache sizes to meet required cost-performance levels for VDBs.
- **Storage device removal UI**  
The team will be able to remove disks on engines backed by block storage through the UI in addition to the CLI in 6.0.15.
- **Zero trust for Postgres**  
6.0.15 supports custom “least privilege” OS user roles to be assigned to the “Delphix\_OS” user to perform virtualization operations from Postgres sources.
- **TDE source database support for EBS plugin**  
6.0.15 supports TDE source databases for the EBS plugin.

### Certifications

- Oracle 19c on RHEL 8.6 (6.0.15.0+)
- Oracle 21c on RHEL 8.6 (6.0.15.0+)
- AppData on RHEL 8.6 (6.0.15.0+)

## Release 6.0.14.0

- The **Delphix DevOps data platform** will feature some product name changes to better align with our offered solutions:
  - **Continuous Data** (Virtualization)
  - **Continuous Compliance** (Masking)
  - **Continuous Vault** (Data vault)
- **Single engine Continuous Vault**  
The Single Engine Continuous Vault provides effective protection against ransomware attacks in a standalone Delphix Engine. This option may be preferable for deployments where maintaining two separate engines is not architecturally necessary. See Delphix Continuous Vault for more information.
- **AWS cloud engines**  
This offering will support the use of AWS S3 object storage in place of traditional block storage, making it

easier and more efficient to store more data for longer with Delphix. For this release, only engines deployed on AWS are supported, with support for other infrastructures to come.

- **Microsoft SQL Server Virtual-to-Physical (V2P) improvements**  
With these new improvements, users can specify a separate drive for SQL Server transaction log files, since these often need to split across multiple locations due to size. This ensures that DB files rehydrate in the manner that is most efficient during initial V2P, which helps avoid unnecessary downtime; this works in tandem with our ransomware solution. An additional enhancement to improve transfer performance involves replacing XCopy with Robocopy multithreading capabilities.
- **Oracle MT TDE support for encrypted system tablespaces**  
Every Oracle database has a system tablespace that is always used to store system data, including information about database tables, indexes, sequences, and other objects. Oracle TDE can encrypt, in addition to the data itself, the system tablespace for maximum security. This feature allows Delphix to provision VDBs with TDE-enabled encrypted system tablespaces to maintain the overall database security in non-production environments.
- **Staging push for SAP HANA via CommVault**  
CommVault is the most popular backup application for SAP HANA. We have certified that the backup application can be used as expected by our customers with our new Staging Push capability.
- **Salesforce data protect and version performance improvements**  
The March release will allow the user to configure up to 30 parallel upload threads (a 10x increase), improving our restore performance to ensure a fast recovery. We've also added several improvements towards faster and leaner retries for any records that fail during restore, plus increased the efficiency and reuse of API calls while downloading data (leading to faster backups and better resource utilization).
- **Ingest and restore for PostgreSQL**  
This feature allows you to ingest logical backups (pg\_dump/pg\_restore) from PostgreSQL, which enables workflows for direct ingestion from PaaS data sources (AWS Aurora & RDS), deployment to IaaS-hosted targets, and selective ingestion of individual databases from multiple database instances of PostgreSQL.

#### Certifications

- Oracle 19c on RHEL 8.5 (6.0.14.0+)
- Oracle 21c on RHEL 8.5 (6.0.14.0+)
- AppData on RHEL 8.5 (6.0.14.0+)

## Release 6.0.13.0

### New in this release

- **Support for AWS object storage**  
This release adds support for the use of AWS S3 object storage in place of traditional block storage. This release currently supports only those engines that are deployed on AWS.
- **Staging push for SQL Server**  
This release supports staging push for SQL Server. Staging push allows you to push data to Delphix if you have tools, configurations, or security concerns that do not work with the existing pull model. Staging push enables, for example, compatibility with data stored in backup systems and gives you control over the staging database. For more information, see [Staging Push Implementation for SQL Server](#).
- **Support for TLS 1.3**  
This release provides support for TLS 1.3 for connections from the virtualization engine to the host and engine-to-engine communication.
- **Auto vPDB restart for single tenant linked CDBs**  
This release supports the auto-restart feature for single-tenant vPDBs in a linked CDB. The auto-restart feature allows the virtualization engine to detect and restart VDBs if the remote host has been restarted.

- **Transparent Data Encryption (TDE) for Oracle Multitenant RAC (Oracle 18c and 19c)**  
This release adds support for provisioning a TDE-encrypted vPDB to a linked (Physical CDB) target RAC environment on Oracle 12.2.
- **FluentD monitoring**  
FluentD is a popular open-source data logging layer for DevOps and [Site Reliability Engineering \(SRE\) teams](#) to stream telemetry to their chosen monitoring solution to improve systems observability. Delphix already provides the ability to forward data events and performance metrics to [Splunk](#). Delphix 6.0.13 enables additional Fluentd configurations to be developed and added to the engine. extending [telemetry output](#) to new tools like ELK, New Relic, and DataDog.
- **Db2 plugin version 4.1.3**  
This plugin release resolves some issues that are listed in the [Db2 Release Notes](#).
- **EBS plugin version 3.0.3**  
This plugin release resolves some issues that are listed in the [EBS Release Notes](#).

## Certifications

- **Virtualization**
  - Microsoft Windows Server 2022
  - Oracle E-Business Suite (EBS) 12.2.11 in OCI
- **Hypervisors/Clouds**
  - ESXi 7.0 U3c

- For DSIL plugin version-specific release notes, see [Data Source Integration \(Plugin\) Release Notes](#).
- For masking release notes, see [Masking Release Notes](#).
- For DCT release notes, see [DCT SaaS](#) or [DCT Multicloud](#).

## Release 6.0.12.0

### New in this release

- **HANA staging push**  
The HANA 2.0 plugin introduces the Staging Push feature. This feature provides a new data ingestion mechanism that helps users to push data into the Delphix-provided mount point on their own. For more information, see [Delphix Architecture for HANA](#).
- **Multiple device removal**  
You can now remove multiple storage devices at a time when engines are over-provisioned or when moving to new storage. This is done only after ensuring sufficient resources to support the removal.
- **Transparent Data Encryption (TDE) for Oracle Multitenant RAC (Oracle 12.2 and 21c)**  
The Oracle TDE feature encrypts the sensitive data (database tables and tablespaces) stored on the disk. This prevents misuse of the data if the disks or storage mediums are lost or stolen. The data is transparently decrypted for authorized users when they access the data. Our large enterprise customers leverage Oracle RAC configurations for their business-critical applications. We have added support for provisioning a TDE-encrypted vPDB to a linked (Physical CDB) target RAC environment on Oracle 18c and 19c in this release. For more information, see [Provisioning a TDE-enabled vPDB to a Cluster Target](#).

## Certifications

- Oracle 21c on SLES 15 SP3 (6.0.11.0+)
- Oracle 19c on SLES 15 SP3 (6.0.11.0+)
- Oracle 21c on SLES 15 SP2 (6.0.11.0+)
- Oracle 19c on SLES 15 SP2 (6.0.11.0+)

- AppData on RHEL 8.4 (6.0.11.0+)

- For masking release notes, see [Masking Release Notes](#).
- For DCT release notes, see [DCT SaaS](#) or [DCT Multicloud](#).

## Release 6.0.11.0

### New in this release

- **OAuth2 API support**  
The Virtualization and Masking engine APIs are now accessible via OAuth2 tokens that improve Delphix's security offerings. For more information, see [Configuring OAuth2 Authentication for API Access](#).
- **Oracle support for Exadata, Exadata Cloud, or Exadata Cloud-at-Customer (ExaCC) cluster**  
This release adds support for Exadata, Exadata Cloud, or Exadata Cloud-at-Customer (ExaCC) Cluster for Oracle databases. For more information, see [Oracle Support Matrix](#).
- **Apply Hotfixes using the self-service UI**  
You can now apply hotfixes using the self-service upgrade UIs.
- **TDE for Oracle Multitenant - support for rekey**  
Oracle Advanced Security Transparent Data Encryption (TDE) provides the ability to create virtual pluggable databases with a new key (independent from the source database). This is to facilitate another layer of security - ensuring that different keys are used in the production and non-production systems. For more information, see [Provisioning a TDE-enabled vPDB](#).
- **Modify DBID for non-multitenant Oracle VDBs after provisioning**  
You can now generate a new DBID after a VDB is provisioned and refreshed. For more information, see [Generate a New DBID for Oracle VDBs](#). Support for multitenant databases is currently not available.
- **New wizard for creating replication profile**  
A new multi-step wizard is now available that replaces the previous in-place editing option to manage Replication Profiles. For more information, see [Replication User Interface](#).

### Certifications

- Oracle 21c on RHEL 8.4, RHEL 8.3, SLES 15 SP1 (6.0.11.0+)
- Oracle 19c on RHEL 8.4 (6.0.10.0+)
- Exadata Cloud-at-Customer(ExaCC)/Exadata support for Oracle 12.2 on OEL 7.8 and OEL 7.9

- For masking release notes, see [Masking Release Notes](#).
- For DCT release notes, see [DCT SaaS](#) or [DCT Multicloud](#).

## Release 6.0.10.0

### Virtualization

- **SQL Server-support for Azure storage backups**  
SQL native backups can now be read directly from Azure Cloud storage. For more information, see [Restoring SQL Backups Stored in Azure Cloud Storage](#).
- **Support dSource upgrades from Non-MT to MT in Oracle**  
Once a dSource is converted to a multitenant PDB, you will be able to share its storage blocks with its non-multitenant predecessor. Delphix will only store the incremental changes to the database. For more information, see [Prepare and Upgrade a Non-MT Oracle dSource to MT](#).

- **Oracle-provision to the latest Point-In-Time on RAC**  
Provision to the latest point-in-time is now supported.
- **Flexible ORACLE\_HOME permissions configuration**  
Removed the need to set permissions of the "\$ORACLE\_HOME/dbs" subdirectory using STARTUP SPFILE syntax to simplify Oracle operations. For more information, see [Requirements for Oracle Hosts and Databases](#).
- **Support for manually starting an Oracle VDB**  
An Oracle VDB can now be manually started. For more information, see [Manually Starting a VDB](#).
- **Attach and detach Oracle CDB containers**  
Detaching, attaching, and linking of the Oracle CDB containers is now supported via CLI. For more information, see [CLI Cookbook: Attaching, Detaching, or Linking a CDB](#).
- **Password vaults and remote hooks for UI**  
In the 6.0.9.0 release, we introduced the ability to use password vaults with hooks. This allows our customers to ensure a high level of security with all operations with external systems. This can now be configured via the user interface. For more information, see [Passing Credentials Securely to Hook Operations](#).
- **NFSv4**  
NFSv4 is now enabled by default. For more information, see [NFSv4 Configuration](#).
- **12-month support for upgrades and Forward Compatible Replication (FCR)**  
To better align with the Delphix support program, Engine upgrades, and FCR operations must be within versions no more than 12 months apart. For example, upgrading to version 6.0.10.0 will require the previous version to be at least 6.0.4.0. For more information, see [Upgrade Matrix](#) and [Replication Overview](#).
- **HANA plugin port control**  
You can now keep the port numbers consistent throughout the HANA VDB life cycle so that the connections made to the VDBs are not disrupted during their life cycle. For more information, see [Provisioning HANA VDBs: An Overview](#).
- **User-specified mount path For Db2 dSource**  
You can now specify a mount path of your choice to host the dSource dataset on the target host. For more information, see [Linking a Db2 dSource](#).
- **Staging push automation for Db2 dSource**  
You can now use a set of scripts that can be used to automate the restore and roll forward operations on the dSource.

## Certifications

## Virtualization

- [OCI VM.Standard.E4](#)
- [AWS r5n.24xlarge](#)
- [Oracle 21C RH 8.3](#)

## Release 6.0.9.0

## Virtualization

- **Delphix data vault - additions**  
In continuation to the **Delphix data vault for ransomware protection** released in 6.0.8.0, this release enables you to manage this feature from the Delphix Engine user interface and also lets you monitor the regular valid replication received. For more information, see [Delphix Data Vault](#).
- **TLS 1.3**  
The TLS 1.3 support is added as an available secure connection option at the Engine Admin Console to be used between engines.

- **Phonehome data collection frequency**  
The default collection period for the Phonehome users is now changed to daily. For more information, see [System Configurations - Enable Phone Home](#).
- **Password vaults for remote hooks**  
With this release, the hooks running on environments can now obtain credentials from the engine and its configured password vaults. These credentials can be used to perform custom authentication tasks in a secure manner. Currently, this feature is supported via the command line interface only. For more information, see [Passing Credentials Securely to Hook Operations](#).
- **Delphix integrations (dxi) docker image**  
A new dockerized version of the dxi library is now available. For more information, see [Docker Image](#).

## Certifications

- **Virtualization**
  - [EBS 12.2 on Oracle 19c](#)
  - [Db2 11.1.4.6 Fix pack](#)
- **Hypervisors/Clouds**
  - [ESXi 7.0 U2](#)

## Release 6.0.8.0

### Virtualization

- **Delphix data vault**  
The Delphix Data Vault for ransomware protection (accessible via CLI) enables organizations to recover access to their application data much faster than traditional backup solutions after malicious attacks. It relies on the new **data vault** Replication feature, which replicates critical business DB data stored on Delphix engines to a new target engine called Data Vault. Once securely stored on the Data Vault, the replicated DB data can be used to recover business applications upon a ransomware attack with very low RTO and RPO.
- **Dxi executable and support for encrypted credentials**  
We will be distributing the dxi CLI, a Delphix solution built to facilitate simpler and seamless integration of Delphix Platform Operations into existing workflows, such as Windows, macOS, and RHEL binaries. This will simplify adoption and remove the requirement on Python. Delphix has also added encryption for the login credentials.
- **Expansion of retention period on replicated objects**  
At present, when snapshots on the replication source engine are deleted (either due to retention policies or user action), the next replication job will delete those snapshots on the replication target engine. This improvement will allow you to extend the retention period of replicated objects on target engines while keeping the original retention at the source. Once the object in the target engine reaches its retention period, it will be flagged and deleted by the policy agent based on a daily schedule.
- **Db2 staging push**  
Delphix now supports Staging Push for non-DPF Db2 databases. The Staging Push architecture will allow organizations to bring their data to Delphix, with their own tools and standard processes. This facilitates the use of any backup tool, a major ongoing source of requests. This should dramatically increase the volume of data that can be easily managed by Delphix.
- **HANA plugin staged architecture**  
Delphix introduces a staging architecture for HANA virtualization. This will make it consistent with other virtualized data sources. This new architecture will build a foundation for future staging push capabilities, as Delphix has begun to introduce other platforms. These changes, together, will allow us to support more prospective organizations with various SAP-certified, 3rd-party backup applications for HANA. Delphix will continue to support the pull ingestion method with HANA native backups and logs.

- **ASE native encryption support**

SAP ASE version 16.0 introduces the ability to fully encrypt databases and provides protection for all the data, indexes, and transaction logs in a database. This offers full database protection while allowing the user to query and manage the data as usual, as the encryption is transparent to existing functions. In response to customer demand, we have added a security enhancement to support encrypted ASE databases. This allows customers to maintain the ASE encryption that is active on their sources and propagate that through to their VDBs.

- **System tunable interface**

A new web service API is introduced which allows you to set or receive the values of a system tunable via Delphix CLI. A Support engineer can now provide context via a Support case to modify these values.

- **Oracle customized full backups**

There is a rarely-seen bug in Oracle that results in some blocks not being written to the datafiles during an Oracle SnapSync operation. When this happens, the datafiles can become incomplete and provisioning/refreshing from that snapshot might fail. We are providing a SnapSync option via CLI that you can customize to accept all datafiles during an Oracle SnapSync operation to prevent this error.

## Release 6.0.7.0

### Virtualization

- **Simplified connection management for Oracle databases**

This feature streamlines the way that Delphix communicates and interacts with Oracle databases by simplifying the connection management infrastructure. Prior to this release, connections were established to Oracle databases using two different methods (remote connections from the Delphix Engine and local connections from the Delphix toolkit) and communication was performed with Oracle databases using two different users (a Delphix OS user and a Delphix DB user). Starting with this release, all communication with Oracle databases will be performed locally on the Oracle host and all connections to Oracle databases will be established using OS authentication. Existing Oracle dSources and VDBs will continue to function with no user intervention required. This feature results in several key benefits for Oracle DB customers such as the elimination of the requirement for a Delphix DB user when linking, automated PDB discovery, elimination of Delphix interaction with any network listener, and many more.

- **Virtualization SDK support for password vaults**

Building off of the existing CyberArk and Hashicorp support for Oracle, SQL Server, and SAP ASE database user credentials, Continuous Data will extend password vault coverage to the virtualization SDK (vSDK). This will enable data sources that are connected via a vSDK plugin to incorporate this more secure method of authentication.

- **SAP ASE device mapping improvements**

The Continuous Data experience with SAP ASE heavily relies on and mirrors a database's device allocation from the initial load (creating the dSource) to provision (creating VDBs). As these source device allocations shift over time, Delphix maps these changes and propagates them to their associated Delphix objects. However, dramatic device layout changes can negatively impact performance. This enhancement provides a quality-of-life (QoL) improvement to the overall SAP ASE experience by providing better error handling and escape valves should a dSource get into a bad state due to a major device layout shift.

- **Improved storage utilization for large pools**

Up through the 6.0.6 release, Continuous Data has enforced a storage usage limit of 85%. Once met, this limit will cause certain API operations to be disabled to ensure engine data integrity. In the 6.0.7 release, this threshold is relaxed significantly. The new thresholds are as follows:

- “Warning”: when 85% of the total storage quota is reached or 1536GB of free storage is remaining (whichever is less), which can be resolved/ignored, with no impact on system behavior.
- “Critical”: when 90% of the total storage quota is reached or 1024GB of free storage is remaining (whichever is less), which cannot be resolved/ignored, with some impact on system behavior.

- “Minimum”: when 95% of the total storage quota is reached or 512GB of free storage is remaining (whichever is less). In this case, a critical fault is raised and cannot be resolved/ignored, with a substantial impact on system behavior (stop policies, VDB operations, etc).
- **PVSCSI support**  
In addition to LSI Logic, with the 6.0.7 release, Delphix has added support for the VMware Paravirtual vSCSI controller (aka PVSCSI). While VMware designed PVSCSI to support very high throughput with minimal processing cost, the performance improvements on Delphix engines can vary from case to case. In 6.0.7, we also support manual changes from LSI Logic to PVSCSI for currently deployed engines.

## Release 6.0.6.0

### Virtualization

- **Solaris x86 to Linux x86 Oracle DB provisioning**  
This feature allows the provisioning of Oracle Virtual Databases from Solaris x86 dSources to Linux x86 target environments.
- **TDE for Oracle Multitenant**  
Oracle Advanced Security Transparent Data Encryption (TDE) provides the ability to encrypt sensitive application data on storage. Delphix will now support TDE for Oracle 12cR2, 18c, and 19c multitenant. This release introduces support for single-instance linked container databases (CDBs) using software keystores. Virtual Container Database (vCDBs), RAC, and rekeying of the TDE encryption keys are not supported in this release.  
**Note:**  
Please note the following important restrictions for **TDE for the Oracle Multitenant** feature:
  - TDE-enabled vPDBs must be provisioned to a linked CDB, not a vCDB.
  - RAC dSources and target CDBs are not supported.
  - The Oracle version must be 12.2 or higher (12.1 is not supported).
  - System tables or tablespaces either in the PDB or CDB must not be encrypted.
  - Oracle Key Vault is not supported.
  - Hardware keystores are not supported.
  - Keystores must not be on ASM storage.
  - The dSource from which the initial provision is done must be encrypted when it is linked. Existing dSources cannot be encrypted without unlinking and creating a new dSource.
  - Encrypting an already-provisioned unencrypted vPDB (with clear data) which is managed by Delphix is not supported
- **Single to Multitenant VDBs**  
Oracle announced the end of support for non-multitenant databases in their 20c release, and as such, Oracle DB customers are planning their upgrade and migration programs. Delphix will now support provisioning a virtual pluggable database from a non-multitenant virtual database.
- Added support for **HashiCorp namespaces**.

### Certifications

- **Virtualization**
  - ASE 15.7/16 on RHEL 7.9
  - Oracle 12.1 on RHEL 7.9 and SLES 12 SP5
  - Oracle 12.2 on RHEL 7.9 and SLES 12 SP5
  - Oracle 19c on RHEL 7.9 and SLES 12 SP5
- **Hypervisors/Clouds**
  - ESXi 7.0 U1

## Release 6.0.5.0

### Virtualization

- **NFSv4 support:**  
Support has been added for Oracle and ASE on AIX.
- **Expanded Replication: Replication of non-data objects**  
Our customers are increasingly using replication to facilitate moves of data across network boundaries, to the cloud, and for DR purposes. We've had long-standing requests to replicate more than just the data, and in this release, we will support the replication of users, roles, permissions, policies, and configuration templates.
- **Upgraded Windows Connector:**  
The Windows Connector will now support newer versions of Microsoft's .NET framework (4.x), which encompasses myriad higher security standards, new functionality, etc. Previously, the connector relied on .NET 3.5 due to two dependencies: SQL Server and Powershell, both have since been removed with SQL Server 2016+ and Powershell update in 6.0.3.0.
- **Db2 Extensible Ingestion:**  
We will now support an extensible model for ingesting Db2 data. In this new, additive, model, we will support customers manually performing a restore & roll forward of their staging database to Delphix from native backups or arbitrary third-party backup tools which integrate directly with Db2. This will allow customers to bring data from whatever system or backup they have and restore it to an exact point in time, as needed.

### Certifications

- **Virtualization**
  - ASE 16.0 on RHEL8.1 and RHEL8.2 on 6.0.4+
  - ASE 16.0 on SLES12.4 on 6.0.4+
  - Oracle 19.7 on RH7.8 and RH8.0 on 5.3.9+ and 6.0.3+
  - ESX 7.0
  - NFS v4 support on AIX
  - IBM Cloud Catalog. Delphix is now available in the IBM Cloud Catalog, a private marketplace for trusted IBM Technology partners that is offered to large IBM enterprise customers. In 6.0.5 we will start with a few certified instances for virtualization and masking and will grow our presence as more the business justifies the cost and efforts. Specifically, we support the following instances:
    - mx2-8x64
    - mx2-16x128
    - mx2-32x256
    - mx2-48x38
  - Oracle Cloud: The following are newly supported instance types:
    - VM.Standard2.8
    - VM.Standard2.16
    - VM.Standard2.24

## Release 6.0.4.0

### Virtualization

- **HashiCorp and expanded CyberArk support:**  
Delphix has extended both CyberArk and HashiCorp Vault support to Oracle Database Users in addition to previously supported ASE and MSSQL domain users. GUI support for HashiCorp Vault has been added during setup to authenticate host users and database users.

**Note:**

The HashiCorp namespace Enterprise feature is supported starting 6.0.6.0.

- **NFSv4 support:**

Support has been added for SuSE and Db2 on AIX.

## Certifications

- **Virtualization**

- OCI Support
- NFSv4 support for Db2 on AIX and SuSE
- SQL Server Instances with a Managed Service Account

## Release 6.0.3.0

### Virtualization

- **CyberArk and Hashicorp vault support for virtualization:**

Delphix is introducing password vault support to authenticate environment and database linking and will support both CyberArk with Oracle and Hashicorp with CLI only.

- **Capacity management:**

Understanding where and how storage is used on Virtualization Engines can be a challenge, in particular, understanding how and where space is held and how to recover it. In this release, Delphix provides better details of held space, particularly around locked objects, and provides clear instructions about what steps are required to free up space.

- **Diagnosability:**

Additional performance health-check analytics in phone-home have been added to better troubleshoot and understand customer problems.

- **Powershell upgrade:**

Delphix is reducing our requirements for Windows hosts running PowerShell by allowing you to use any PowerShell version from 2.0 to 5.1. Delphix will now use the default available PowerShell version on each host. When specifying hooks (such as “configureClone”), users may specify whether to use 2.0 or whatever PowerShell version is installed on the host.

- **Support for Oracle read-only homes:**

Delphix is introducing support for Oracle read-only homes, which is a new Oracle feature starting with Oracle 18c. In a read-only Oracle home, all the configuration data and log files reside outside of the read-only Oracle home. This feature allows you to use the read-only Oracle home as a software image that can be distributed across multiple servers.

- **Replication performance:**

Delphix will continue to improve replication performance for replication specifications that include multiple objects and single-object replication throughput.

- **SAP ASE support for VDB upgrade:**

SAP ASE Customers will now be able to validate DBMS Upgrades with this feature that enables provisioning VDBs to a higher version than the source DB (e.g. ASE 15.7 > ASE 16).

- **Shared NFS for toolkits**

With this release, Delphix introduces shared NFS for clustered environments. Customers wish to use a common NFS mount point, in which the Delphix toolkit for each cluster node can be deployed. The product today only creates a directory with appliance UUID and OS user in the folder name and uses this for detection to determine if a host is already managed by that Engine. As such, this prevents the customer from utilizing common NFS storage due to name conflict.

When a new environment is created, upgraded or if the toolkit path is changed, a new toolkit is created with naming convention Delphix\_COMMON\_ for common directory and Delphix\_ for user directory.

With this change, the customer can use mounts on shared file systems (like NFS) as a toolkit path for clustered environments without any naming conflict. This change is not intended for windows environments.

## Certifications

- **Virtualization**
  - EBS 12.2 with RHEL 7.6
  - PostgreSQL 12.1 & 12.2 with RHEL 7.8
  - Oracle 11g R2 and Oracle 19c with RHEL 7.8 on 5.3.9.0 and 6.0.2+

## Release 6.0.2.0

### Virtualization

- **Support for Db2 Database Partition Feature (DPF):**  
Delphix has long supported distributed Db2 (running on Unix/Linux Systems). However, Db2 supports partitioned databases as a means of scaling to larger, more complex systems. With this release, Delphix will now support Db2 DPF allowing you to scale to an increasing number of your Db2 databases.
- **Windows authentication for SQL Server:**  
You will now be able to use Windows Authentication to link SQL Server databases. Rather than providing both a database user and a Windows user to ingest data, you can leverage one set of credentials (a Windows OS user) to perform all source operations. This capability will simplify SQL Server deployments and reduce Delphix's security requirements on source databases.
- **Smart failover:**  
Smart Failover allows the Delphix Administrator to simplify failover processes by automating object conflict resolution. By selecting a new option "Automate Object Conflict Resolution" before the failover process starts, the failover process will rename all conflicting objects and show a report of all object changes at the end.
- **NFSv4 support:** In 6.0.2 Delphix will start providing NFSv4 for data sources running on RedHat 7.0 or later. NFSv4 can be enabled using the CLI. Support for additional host OS versions will be added in subsequent releases. Delphix will consider enabling NFSv4 by default for those supported configurations in a future release.
- **Support bundles not required for upgrade:** When upgrading from 6.0.0 or greater to a release 6.0.2 or greater, we no longer require support bundles to be sent to Delphix. This allows you to execute more self-service upgrades.

## Certifications

- ASE 16.0 on AIX 7.1
- AWS r5n Instance Support: r5n.2xlarge, r5n.8xlarge, r5n.16xlarge
- Azure E Series Instance Support: E8s\_v3, E16s\_v3, E32s\_v3
- Masking support of Oracle 19c.

## Release 6.0.1.0

- **Masking extended connectors:** A very common request for masking has been to support additional data sources, outside of [the currently supported list](#). Thus, the next step in the strategy is the release of Masking Extended Connectors, which will allow our customers to add JDBC drivers to the masking engine to facilitate the masking of additional data sources. This will allow masking to be used for other common databases that can be accessed via JDBC, like SAP HANA, Informix, etc.
- **SQL server CDC support:** We have expanded our support for SQL Server databases using [Change Data Capture](#) (CDC), a SQL Server feature that captures all the change information that is applied to the databases

and stores it in change tables. Now, users will have the ability to preserve CDC data and enable CDC for SQL Server VDBs.

## Certifications

- **Virtualization**
  - ASE 16 and 15.7 with Solaris SPARC 11U3 and SPARC 11U4
  - ASE 16 and 15.7 with RHEL 7.7
  - SQL Server 2019 Support with Windows 2016 and Windows 2019
  - Oracle 19c with SUSE SLES 15 SP1
  - Oracle 19c with Solaris 11 U4 and U3 x86
- **Hypervisors:** The following hypervisors have been certified in 6.0.1.
  - VMware ESX 6.5 U1, U2, U3
  - VMware ESX 6.7 U3

## Release 6.0.0.0

**Google cloud support:** Delphix now supports running in Google Cloud Platform for existing supported databases.

**Enhanced Networking Adapter (ENA) support:** Delphix supports networking on AWS instances with the Elastic Network Adapter (ENA). This offers our customers enhanced networking capabilities and more economical options. Notably, this includes the AWS R4 instance types.

- **Masking NFS/CIFS mount:** Our customers increasingly are masking files alongside their databases. The masking engine has classically supported this via FTP/SFTP but now to make things easier Delphix has introduced the ability to directly mount and mask a file system - over NFS and CIFS. This should dramatically simplify the process of file masking.
- **Oracle quality:** Continued focus on Oracle quality and have introduced several quality improvements with our 6.0 release.
- **Masking API updates:** 6.0 introduces a significant number of new endpoints, including mainframe control, as well as updates for existing endpoints. This release also introduces versioning for the masking API, allowing our customers to upgrade without risk of breaking their integrations.
- **AdoptOpenJDK 8 for the Delphix toolkit:** Delphix has changed the Java Development Kit (JDK) that is included with the toolkit, and is sent to all Delphix connected environments. Customers who require using Oracle Java may continue to do so with the feature to provide their own Java, which shipped in 5.3.5.
- **Removed instance check:** When running in AWS or Azure, the product will no longer raise a fault when it detects that it is running on an unsupported instance. This enables Delphix to certify previously released software on new instances without having to modify the software. The product will still detect what instance it is running on and include this information in the user interface and phone home bundles. We will also continue to publish a matrix of supported instances for Azure, AWS, and GCP in the product documentation. Delphix provides no guarantee of performance or support for unsupported instance types.
- **Upgrade process:** The upgrade to 6.0 will be an in-place upgrade like other Delphix releases, there are a few changes that will improve the process overall for 6.0:
  - We will require an upgrade to an interim release first (either 5.3.6). This can be done at the same time as the customer upgrades to 6.0 or in the months prior.
  - We will be introducing new upgrade checks to ensure that customers are not using features that have been removed. For a list of removed features see [Deprecated and End-of-Life Features](#).
    - We will provide an upgrade image specific for each platform we support with Virtualization (VMWare, AWS, Azure, GCP). This will allow us to be more precise in customizing the images for each.

## API changes

This section covers the following topics:

- [API changes in Delphix 10.0.0.0](#)
- [API changes in Delphix 9.0.0.0](#)
- [API changes in Delphix 8.0.0.0](#)
- [API changes in Delphix 7.0.0.0](#)
- [API changes in Delphix 6.0.17.0](#)
- [API changes in Delphix 6.0.16.0](#)
- [API changes in Delphix 6.0.15.0](#)
- [API changes in Delphix 6.0.14.0](#)
- [API changes in Delphix 6.0.13.0](#)
- [API changes in Delphix 6.0.12.0](#)
- [API changes in Delphix 6.0.11.0](#)
- [API changes in Delphix 6.0.10.0](#)
- [API changes in Delphix 6.0.9.0](#)
- [API changes in Delphix 6.0.8.0](#)
- [API changes in Delphix 6.0.7.0](#)
- [API changes in Delphix 6.0.6.0](#)
- [API changes in Delphix 6.0.5.0](#)
- [API changes in Delphix 6.0.4.0](#)
- [API changes in Delphix 6.0.3.0](#)

## API changes in Delphix 10.0.0.0

In Delphix 10.0.0.0, the new API version is 1.11.21. This section describes all API changes since API version 1.11.20, which was released with Delphix 9.0. All URL paths are relative to

`/resources/json/delphix.`

### What's changed?

API object	Path	Type	Name	Change
NfsConfig	/service/nfs	Property	mountVersion	Property mountVersion (enum) has been updated to include NFSv4.
OracleVirtualCdbSource	NA (value type)	API Type	OracleVirtualCdbSource	Removed property nodeListeners.
PasswordVaultTestParameters	NA (value type)	API Type	PasswordVaultTestParameters	Removed properties host and port.
SystemInfo	/System	Property	maxHeapSizeGb	Maximum heap size of the management application.

### What's new?

API object	Path	Type	Name	Description
AzureAuthentication	NA (value type)	API Type	AzureAuthentication	Parameters for authenticating to an Azure vault.
AzureSecretsAuthentication	NA (value type)	API Type	AzureSecretsAuthentication	Secret credential for authenticating to an Azure vault.

API object	Path	Type	Name	Description
AzureVaultCredential	NA (value type)	API Type	AzureVaultCredential	The Azure vault based security credential.
AzureVaultTestParameters	NA (value type)	API Type	AzureVaultTestParameters	Azure password vault test configuration.
AzureVault	NA (value type)	API Type	AzureVault	Azure password vault configuration.
HostedVaultTestParameters	NA (value type)	API Type	HostedVaultTestParameters	Hosted password vault test configuration.

## API changes in Delphix 9.0.0.0

In Delphix 9.0, the new API version is 1.11.20. This section describes all API changes since API version 1.11.19, that was released with Delphix 8.0.0.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
<code>MSSqlVirtualSource</code>	NA (value type)	Property	<code>configs</code>	Can now be updated via CLI.
<code>CyberArkPasswordVault</code>	NA (value type)	API Type	<code>CyberArkPasswordVault</code>	Returns a list of password vault objects on the system. Limits CLI visibility for create, update and delete of password vault objects to system users only.
<code>NamespaceFailoverParameters</code>	NA (value type)	API Type	<code>NamespaceFailoverParameters</code>	Removed property <code>smartFailover</code> .
<code>PasswordVault</code>	<code>/service/passwordVault</code>	API Type	<code>PasswordVault</code>	Removed property <code>host</code> and <code>port</code> .
<code>TimeZone</code>	<code>/timezone</code>	Property	<code>id</code>	Property <code>id</code> (enum) has been updated to include <code>America/Rosario</code> , <code>Europe/Belfast</code> .

## What's new?

API object	Path	Type	Name	Description
MSSqlVirtualSource	N/A (value type)	Property	configTemplate	Optional database template to use for provisioning, refresh and enable. If set, configParams will be ignored on the provision or refresh.
HostedPasswordVault	N/A (value type)	PropertyAPI Type	HostedPasswordVault	Password vaults with host and port.
UnixHost	N/A (value type)	Property	toolkitPath	Added property format with value unixabsolutePath.
OracleDBExportParameters	N/A (value type)	API Type	OracleDBExportParameters	Parameters to use as input to export Oracle non-MT databases.
OracleEnhancedExportParameters	N/A (value type)	API Type	OracleEnhancedExportParameters	The enhanced parameters to use as input to export Oracle databases.
OraclePDBExportParameters	N/A (value type)	API Type	OraclePDBExportParameters	Parameters to use as input to export Oracle PDB databases.
OracleExportPDBInPlaceTransferStrategy	N/A (value type)	API Type	OracleExportPDBInPlaceTransferStrategy	Convert a virtual PDB to a physical PDB in-place.

API object	Path	Type	Name	Description
OracleExportDBInPlaceTransferStrategy	N/A (value type)	API Type	OracleExportDBInPlaceTransferStrategy	Convert a non-MT virtual DB to a physical DB in-place.
OracleExportASMStorageStrategy	N/A (value type)	API Type	OracleExportASMStorageStrategy	Storage strategy for exporting database files to ASM.
OracleASMLayout	N/A (value type)	API Type	OracleASMLayout	ASM diskgroups for datafiles, archive logs/redo logs.

## API changes in Delphix 8.0.0.0

In Delphix 8.0.0.0, the new API version is 1.11.19. This section describes all API changes since API version 1.11.18, which was released with Delphix 7.0.0.0. All URL paths are relative to `/resources/json/delphix.`

### What's changed?

API object	Path	Type	Name	Change
FluentdConfig	/service//fluentd/configuration	Property	performanceMetricsResolution	Can now set property via CLI.
NamespaceFailoverParameters	N/A (value type)	Property	getFailbackCapability	Return object has changed from string to object.
RepavePrepareParameters	N/A (value type)	API Type	RepavePrepareParameters	Removed properties: <ul style="list-style-type: none"> <li>quiesceSources</li> <li>enableSourcesOnFailure</li> <li>ignoreMaskingJobsInProgress</li> </ul> Added property: <ul style="list-style-type: none"> <li>unquiesceSourcesOnFailure</li> </ul>
SNMPV2Config	/service/snmp/v2	Property	severity	Added enum value AUDIT.
Source	/source	Property	update	Restrict CLI visibility to domain users only.
Source	/source	Property	operations	Restrict CLI visibility to domain users only.
Source	/source	Property	disable	Restrict CLI visibility to domain users only.

API object	Path	Type	Name	Change
Source	/source	Property	stop	Restrict CLI visibility to domain users only.
Source	/source	Property	lock	Restrict CLI visibility to domain users only.
SsoSuccessfulLoginRecord	N/A (value type)	API Type	SsoSuccessfulLoginRecord	Redact email from logs.
User	/user	Property	isDefault	Can no longer set property via CLI.

### What's new?

API object	Path	Type	Name	Description
CloudEndpoint	N/A (value type)	API Type	CloudEndpoint	A mapping of a recommend region and endpoint for use with Cloud Engines.
FailbackCapability	N/A (value type)	API Type	FailbackCapability	A replica namespace's fallback capability.
OracleLinkedSourceOperations	N/A (value type)	API Type	OracleLinkedSourceOperations	Describes operations which are performed on linked sources at various times.
SystemInfo	/system	Property	rootOperations	Added getRecommendedCloudStorageEndpoints to get list of recommended endpoints and regions for Cloud Engine setup.

API object	Path	Type	Name	Description
OracleBaseLinkData	N/A (value type)	Property	operations	Added preLogSync property and new optional fields.
OracleLinkedSource	N/A (value type)	Property	operations	Added preLogSync property and new optional fields.

## API changes in Delphix 7.0.0.0

In Delphix 7.0.0.0, the new API version is 1.11.18. This section describes all API changes since API version 1.11.17, which was released with Delphix 6.0.17.0. All URL paths are relative to `/resources/json/delphix.`

### What's changed?

API object	Path	Type	Name	Change
Domain	N/A (value type)	API Type	lock	Restrict CLI visibility to domain users only.
MSSqlExportParameters	N/A (value type)	Property	prodSyncConfigParameter	Property removed.
NettyVersionInfo	/netty	Property	NettyVersionInfo	API object removed.
OracleExportAsmParameters	N/A (value type)	Property	OracleExportAsmParameters	API object removed.
SystemPackage	/system/package	Property	SystemPackage	API object removed.

### What's new?

API Object	Path	Type	Name	Description
Domain	N/A (value type)	Property	cliVisibility	Restrict CLI visibility to system or domain users.
FluentdAttribute	N/A (value type)	API Type	FluentdAttribute	Fluentd attribute.

FluentdConfig	N/A (value type)	API Type	FluentdConfig	Fluentd configuration information.
FluentdPlugin	/service/fluentd/plugins	API Type	FluentdPlugin	Upload and manage fluentd plugins.
FluentdRegularAttribute	N/A (value type)	API Type	FluentdRegularAttribute	Fluentd attribute with a plain value.
FluentdSecretAttribute	N/A (value type)	API Type	FluentdSecretAttribute	Fluentd attribute with a secret value.
MSSqlSnapshot	N/A (value type)	Property	emptySnapshot	Readonly - True if the staging push dSource snapshot is empty.
OracleStagingSource	N/A (value type)	Property	customEnvVars	Custom environment variables for Oracle databases.
OracleBaseStagingLinkData	N/A (value type)	API Type	OracleBaseStagingLinkData	Represents common parameters to link an Oracle database using a staging database.
OracleStagingPushSyncParameters	N/A (value type)	API Type	OracleStagingPushSyncParameters	The parameters to use as input to sync a staging Oracle database.
OracleStagingPushSyncStrategy	N/A (value type)	API Type	OracleStagingPushSyncStrategy	Oracle specific parameters for staging push sync strategy.

<p>OracleSyncFromStagingParameters</p>	<p>N/A (value type)</p>	<p>API Type</p>	<p>OracleSyncFromStagingParameters</p>	<p>The parameters to use as input to sync from a Staging Oracle database.</p>
<p>OracleLinkFromStaging</p>	<p>N/A (value type)</p>	<p>API Type</p>	<p>OracleLinkFromStaging</p>	<p>Represents parameters to link a non-pluggable Oracle database using a staging database.</p>

## API changes in Delphix 6.0.17.0

In Delphix 6.0.17.0, the new API version is 1.11.17. This section describes all API changes since API version 1.11.16, which was released with Delphix 6.0.16.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
AppDataExportParameters	N/A (value type)	API Type	AppDataExportParameters	Object now subclasses GenericExportParameters
ASEAttachData	N/A (value type)	Property	stagingPreScript	Property removed.
ASEAttachData	N/A (value type)	Property	stagingPostScript	Property removed.
ASELinkData	N/A (value type)	Property	stagingPreScript	Property removed.
ASELinkData	N/A (value type)	Property	stagingPostScript	Property removed.
ASEStagingSource	N/A (value type)	Property	preScript	Property removed.
ASEStagingSource	N/A (value type)	Property	postScript	Property removed.
DbExportParameters	N/A (value type)	API Type	DbExportParameters	Object now subclasses GenericExportParameters
ExportParameters	N/A (value type)	Property	timeflowPointParameters	Property removed and added to GenericExportParameters

API object	Path	Type	Name	Change
ExportParameters	N/A (value type)	Property	sourceConfig	Property removed and added to GenericExportParameters
OracleHostParameters	N/A (value type)	Property	tdeKeystoresRootPath	Restrict format to valid unix path
OracleVirtualPdbSource	N/A (value type)	Property	targetVcdbTdeKeystorePath	Remove maxLength constraint. Add minLength constraint of 1 character.
RefreshParameters	N/A (value type)	API Type	RefreshParameters	Object now subclasses ReprovisionParameters
RollbackParameters	N/A (value type)	API Type	RollbackParameters	Object now subclasses ReprovisionParameters
TimeflowPointSemantic	N/A (value type)	Property	location	Add OLDEST_SNAPSHOT to acceptable values

### What's new?

API object	Path	Type	Name	Description
Container	/database	Property	cdbContainer	Restrict listing to only include the PDB datasets belonging to the specified CDB dataset reference. This option is mutually exclusive with all the other options.
Container	/database	Object Operations	deprovision	Deprovisions a container.

API object	Path	Type	Name	Description
Container	/database	Object Operations	reprovision	Reprovisions a container. This should only be called after a deprovision using the ReprovisionParameters returned from that operation.
EventsConfig	/service/events	API Type	EventsConfig	Event Message Configuration.
GenericExportParameters	N/A (value type)	API Type	GenericExportParameters	The parameters to use as input to export requests.
JobRetentionConfig	/job/retention	API Type	JobRetentionConfig	Configuration for job retention.
OracleStagingSource	N/A (value type)	Property	allowAutoStagingRestartOnHostReboot	Indicates whether Delphix should automatically restart this staging source when target host reboot is detected.
ReprovisionParameters	N/A (value type)	API Type	ReprovisionParameters	The input parameters to refresh and rollback requests.
SourceIngestionData	N/A (value type)	Property	containerTypeLabel	Human readable description of containerType.
SystemInfo	/system	Property	cloudRegion	The region of the current system if hosted on an applicable cloud service provider.
SystemInfo	/system	Property	smtpConfigured	Whether SMTP has been configured."

## API changes in Delphix 6.0.16.0

In Delphix 6.0.16.0, the new API version is 1.11.16. This section describes all API changes since API version 1.11.15, which was released with Delphix 6.0.15.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
NetworkRoute	/network/route	Property	gateway	Parameter has been made optional.
OracleBaseSourceRuntime	N/A (value type)	Property	databaseMode	UNMOUNTED mode added.

### What's new?

API object	Path	Type	Name	Description
FluentdConfig	N/A (value type)	Property	performanceMetricsResolution	Performance metrics resolution.
HostNfsChecksParameters	N/A (value type)	API Type	HostNfsChecksParameters	Mechanism to verify user can mount/unmount on a remote host.
OracleStagingSourceParameters	N/A (value type)	Property	physicalStandby	Whether this staging database will be configured as a physical standby.
OracleStagingSource	N/A (value type)	Property	physicalStandby	Whether this staging database will be configured as a physical standby.
PasswordResetConfig	N/A (value type)	API Type	PasswordResetConfig	Password Reset Configuration

API object	Path	Type	Name	Description
PasswordResetRequestParameters	N/A (value type)	API Type	PasswordResetRequestParameters	Parameters in a password reset request.
PasswordResetValidationParameters	N/A (value type)	API Type	PasswordResetValidationParameters	Self-service password Reset validation parameters.
PasswordResetValidationResult	N/A (value type)	API Type	PasswordResetValidationResult	Self-service password Reset validation result.
PluginManifest	N/A (value type)	Property	hasLinkedSourceSize	Indicates whether linked.source_size() operation has been implemented.
PluginManifest	N/A (value type)	Property	hasVirtualSourceSize	Indicates whether virtual.source_size() operation has been implemented.
SourceEnvironment	/environment	Property	nfsChecks	Tests that the environment user can run mount and unmount successfully on the host.

## API changes in Delphix 6.0.15.0

In Delphix 6.0.15.0, the new API version is 1.11.15. This section describes all API changes since API version 1.11.14, which was released with Delphix 6.0.14.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
DatabaseTemplate	N/A (value type)	Property	sourceType	MySQLVirtualSource and PgSQLVirtualSource removed from acceptable values.  OracleLinkedSource added to acceptable values.
S3ObjectStoreTestResult	N/A (value type)	API Type	timestamp	Object removed and replaced by ObjectStoreTestResult
ObjectStore	/storage/objectStorage	Property	root	Change root path to /resources/json/delphix/storage/objectStorage
S3ObjectStore	N/A (value type)	Standard operations	read update	Properties removed and added to ObjectStore
S3ObjectStore	N/A (value type)	Root operations	testConnection  cacheHitsReport  clearCacheHits	Properties removed and added to ObjectStore
TimeZone	N/A (value type)	Property	sendSocketBuffer	Add Pacific/Kanton timezone

What's new?

API object	Path	Type	Name	Description
BlobObjectStoreAccess	N/A (value type)	API Type	BlobObjectStoreAccess	Blob object store access
BlobObjectStoreAccessKey	N/A (value type)	API Type	BlobObjectStoreAccessKey	Blob object store access key
BlobObjectStoreAccessManagedIdentities	N/A (value type)	API Type	BlobObjectStoreAccessManagedIdentities	Blob object store access through Managed Identities
ObjectStoreCacheHitsReport	N/A (value type)	API Type	ObjectStoreCacheHitsReport	A cache hits report for an object store
ObjectStoreTestResult	N/A (value type)	API Type	ObjectStoreTestResult	An object store connectivity test result
ObjectStoreTest	N/A (value type)	API Type	ObjectStoreTest	An object store connectivity test object
ObjectStore	/storage/objectStorage	Standard operations	read  update	Retrieve the specified ObjectStore object  Update the specified ObjectStore object

API object	Path	Type	Name	Description
ObjectStore	/storage/objectStorage	Root operations	testConnection cacheHitsReport clearCacheHits	Test connectivity to an object store Get a ZettaCache hits-by-size report Clear the accumulated ZettaCache hits-by-size data

## API changes in Delphix 6.0.14.0

In Delphix 6.0.14.0, the new API version is 1.11.14. This section describes all API changes since API version 1.11.13, which was released with Delphix 6.0.13.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
CompatibilityCriteria	N/A (value type)	Property	processor	Constraints removed
JobEvent	N/A (value type)	Property	timestamp	Description changed to "Time the event last occurred."
MSSqlExportParameters	N/A (value type)	Property	filesystemLayout	Description changed to note this filesystem configuration is specific to an exported MSSQL database.
NetworkDSPTestParameters	N/A (value type)	Property	queueDepth	Changed from 32 to 64
NetworkDSPTestParameters	N/A (value type)	Property	blockSize	Changed from 65536 to 1048576
NetworkDSPTestParameters	N/A (value type)	Property	sendSocketBuffer	Changed from 262144 to 1048576
NetworkDSPTestParameters	N/A (value type)	Property	receiveSocketBuffer	Changed from 262144 to 1048576
OracleBaseDBConfig	N/A (value type)	Property	user	Field changed to be nullable
OracleBaseDBConfig	N/A (value type)	Property	credential	Field changed to be nullable

API object	Path	Type	Name	Change
OracleVirtualPdbSource	N/A (value type)	Property	tdeKeyIdentifier	minLength changed from 1 to 34
Schedule	N/A (value type)	Property	cutoffTime	Added to description: “A value of 0 indicates no cutoff”

### What's new?

API object	Path	Type	Name	Description
AppDataLinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
ASELinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
ASEStagingSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
JobEvent	N/A (value type)	Property	startTimeStamp	Time the event first occurred.
MSSqlFileMappingParameters	N/A (value type)	API Type	MSSqlFileMappingParameters	The parameters to use as input to provide File Mapping for MSSQL databases.
MSSqlLinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
MSSqlStagingSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.

API object	Path	Type	Name	Description
MSSqlTimeflowFilesystemLayout	N/A (value type)	API Type	MSSqlTimeflowFilesystemLayout	A filesystem layout that matches the filesystem of a Delphix MSSQL TimeFlow.
OracleLinkedSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
OracleStagingSource	N/A (value type)	Property	locked	Whether the source is protected from deletion and other data-losing actions.
Source	/source	Root operation	lock	Protects source from deletion and other data-losing actions. Cannot be undone.

## API changes in Delphix 6.0.13.0

In Delphix 6.0.13.0, the new API version is 1.11.13. This section describes all API changes since API version 1.11.12, which was released with Delphix 6.0.12.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
<code>MSSqlNoBackupSyncParameters</code>	API Type	N/A (value type)	<code>MSSqlNoBackupSyncParameters</code>	STAGING_PUSH_INGESTION feature flag removed
<code>MSSqlSourcelessSyncStrategy</code>	API Type	N/A (value type)	<code>MSSqlSourcelessSyncStrategy</code>	STAGING_PUSH_INGESTION feature flag removed
<code>MSSqlStagingPushSyncStrategy</code>		N/A (value type)	<code>MSSqlStagingPushSyncStrategy</code>	STAGING_PUSH_INGESTION feature flag removed
<code>NetworkInterface</code>	API Type	<code>/network/interface</code>	<code>NetworkInterface</code>	Removed Domain User access on CLI
<code>NetworkRoute</code>	API Type	<code>/network/route</code>	<code>NetworkRoute</code>	Removed Domain User access on CLI
<code>NetworkRoute</code>	Property	<code>/network/route</code>	<code>protocol</code>	Changed from "readonly" to "optional" when creating.
<code>OAuth2Config</code>	API Type	<code>/service/oauth2</code>	<code>OAuth2Config</code>	Added Domain User access from CLI. Provide System user only access for updates and root operations.

API object	Path	Type	Name	Change
ObjectStore	API Type	N/A (value type)	ObjectStore	DELPHIX_DATA_BANK feature flag removed.  Added update operation.
OracleDBConfig	Properties	N/A (value type)	databaseName uniqueName	Replace property pattern with format - oracleDatabaseName oracleDbUniqueName
OracleInstance	Property	N/A (value type)	instanceName	Replace property pattern with format - oracleInstanceName
OraclePDBConfig	Property	N/A (value type)	databaseName	Replace property pattern with format - oraclePDBName
S3ObjectStoreAccessInstanceProfile	API Type	N/A (value type)	S3ObjectStoreAccessInstanceProfile	DELPHIX_DATA_BANK feature flag removed.
S3ObjectStoreAccessKey	API Type	N/A (value type)	S3ObjectStoreAccessKey	DELPHIX_DATA_BANK feature flag removed.
S3ObjectStoreAccess	API Type	N/A (value type)	S3ObjectStoreAccess	DELPHIX_DATA_BANK feature flag removed.
S3ObjectStoreTestResult	API Type	N/A (value type)	S3ObjectStoreTestResult	DELPHIX_DATA_BANK feature flag removed.

API object	Path	Type	Name	Change
S3objectStoreTest	API Type	N/A (value type)	S3objectStoreTest	DELPHIX_DATA_BANK feature flag removed.
S3objectStore	API Type	/storage/objectStorage	S3objectStore	DELPHIX_DATA_BANK feature flag removed.  "Update" operation added for all the properties.

### What's new?

API object	Path	Type	Name	Description
FluentdAttributeDefinition	N/A (value type)	API Type	FluentdAttributeDefinition	Fluentd attribute definition.
FluentdAttribute	N/A (value type)	API Type	FluentdAttribute	Fluentd attribute.
FluentdConfig	/service/fluentd/configuration	API Type	FluentdConfig	Fluentd configuration information.
FluentdPlugin	/service/fluentd/plugins	API Type	FluentdPlugin	Upload and manage fluentd plugins.
FluentdRegularAttribute	N/A (value type)	API Type	FluentdRegularAttribute	Fluentd attribute with a plain value.
FluentdSecretAttribute	N/A (value type)	API Type	FluentdSecretAttribute	Fluentd attribute with a secret value.

API object	Path	Type	Name	Description
MaskingServiceConfig	/maskingjob/serviceconfig	Property	maxJobFetchCount	Maximum number of jobs to fetch from masking service. Defaults to 500.
NettyVersionInfo	/netty	API Type	NettyVersionInfo	View netty version and switch between legacy and latest netty version.
ObjectStore	N/A (value type)	Property	configured	States whether an object store has been configured.
OracleBaseStagingLinkData	N/A (value type)	API Type	OracleBaseStagingLinkData	Represents common parameters to link an Oracle database using a staging database.
OracleLinkFromStaging	N/A (value type)	API Type	OracleLinkFromStaging	Represents parameters to link a non-pluggable Oracle database using a staging database.
OraclePDBLinkFromStaging	N/A (value type)	API Type	OraclePDBLinkFromStaging	Represents parameters to link a pluggable Oracle database using a staging database.
OracleSourceLessSyncStrategy	N/A (value type)	API Type	OracleSourceLessSyncStrategy	Base type for Oracle source less sync strategy and associated parameters.
OracleStagingPushSyncParameters	N/A (value type)	API Type	OracleStagingPushSyncParameters	The parameters to use as input to sync a staging Oracle database.

API object	Path	Type	Name	Description
OracleStagingPushSyncStrategy	N/A (value type)	API Type	OracleStagingPushSyncStrategy	Oracle specific parameters for staging push sync strategy.
OracleStagingSourceParameters	N/A (value type)	Property	instanceName	The name (sid) of the instance.
S3objectStore	/storage/objectStores	Root operations	cacheHits ReportclearCacheHits	Get print out of the ZettacCache hit-by-size histogram. Clear the current ZettacCache hit-by-size histogram.
S3objectStoreTestResult	N/A (value type)	Property	errorMessage	Error message from connectivity test.

## API changes in Delphix 6.0.12.0

In Delphix 6.0.12.0, the new API version is 1.11.12. This section describes all API changes since API version 1.11.11, which was released with Delphix 6.0.11.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
AbstractToolkit	/toolkit	property	language	Removed.
CipherSuite	/service/tls/cipherSuite	property	name	Removed values for enum - "TLS_RSA_WITH_AES_256_CBC_SHA", "TLS_RSA_WITH_AES_128_CBC_SHA", "TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA", "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA", "TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA", "TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA", "TLS_DHE_RSA_WITH_AES_256_CBC_SHA", "TLS_DHE_RSA_WITH_AES_128_CBC_SHA", "TLS_DHE_DSS_WITH_AES_256_CBC_SHA", "TLS_DHE_DSS_WITH_AES_128_CBC_SHA".
HttpConnectorConfig	/service/httpConnector	property	tlsVersions	Removed values for enum - "SSLv3", "TLSv1", "TLSv1.1"
OAuth2Config	/service/oauth2	property	userMatchingFieldType	Updated description.

API object	Path	Type	Name	Change
OracleLinkedSource	N/A (value type)	property	config backupLevelEnabled rmanChannels filesPerSet checkLogical encryptedLinkingEnabled compressedLinkingEnabled bandwidthLimit numberOfConnections	Removed.
OracleSource	N/A (value type)	property	config	Removed.
StorageDevice	/storage/device	property	list operations	Removed CliDisplay parameters - "bootDevice", "allocating". Removed operations - "remove", "removeVerify".

API object	Path	Type	Name	Change
UnixHost	N/A (value type)	property	oracleJdbcKeyStorePassword	Removed.
User	/user	property	apiUser	Renamed to allowPasswordAuthentication (see in What's New?)

### What's new?

API object	Path	Type	Name	Description
ConfiguredStorageDevice	N/A (value type)	property	allocating	True if the device is being used for allocations. Allocations will be disabled automatically if the device is going to be removed. The allocating property will also be false for devices that are not configured.
MSSqlNoBackupSyncParameters	N/A (value type)	API Type	MSSqlNoBackupSyncParameters	The parameters to use as input to sync MSSQL databases without a backup.
MSSqlSourcelessSyncStrategy	N/A (value type)	API Type	MSSqlSourcelessSyncStrategy	MSSQL specific parameters for sourceless sync strategy.
MSSqlStagingPushSyncStrategy	N/A (value type)	API Type	MSSqlStagingPushSyncStrategy	MSSQL specific parameters for staging push sync strategy.
OracleHostParameters	N/A (value type)	API Type	OracleHostParameters	Oracle specific host parameters.

API object	Path	Type	Name	Description
OracleLinkedSource	N/A (value type)	property	syncStrategy overrideMapsTo	Parameters used to sync the container. These are persisted and used for every sync operation.  Override 'mapsTo' property from source.js for the query parameters defined in 'list' section.
OracleManagedSource	N/A (value type)	property	config	Reference to the configuration for the source.
Plugin	N/A (value type)	property	language	Implementation language for workflows in this plugin.
StorageDeviceRemovalStatus	/storage/remove	property	rootOperations	Add "start" and "verify" root operations to <ul style="list-style-type: none"> <li>remove storage devices</li> <li>verify storage devices can be removed.</li> </ul>
StorageDeviceRemoveParameters	N/A (value type)	API Type	StorageDeviceRemoveParameters	The parameters to use as input when removing devices.
UnixHost	N/A (value type)	property	oracleHostParameters	The Oracle specific parameters associated with the host.
User	/user	property	allowPasswordAuthentication	If the Delphix Engine has been configured for SAML SSO, only users with this property set can authenticate with a username and password for API or CLI access.

## API changes in Delphix 6.0.11.0

In Delphix 6.0.11.0, the new API version is 1.11.11. This section describes all API changes since API version 1.11.10, which was released with Delphix 6.0.10.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
AdvancedSettingsInfo	/system/advancedSettings	API Type	AdvancedSettingsInfo	Hidden behind feature flag SYSTEMTUNABLEINTERFACE
DelphixManagedBackupIngestionStrategy	N/A (value type)	API Type	DelphixManagedBackupIngestionStrategy	Removed.
ExternalBackupIngestionStrategy	N/A (value type)	API Type	ExternalBackupIngestionStrategy	Removed.
IngestionStrategy	N/A (value type)	API Type	IngestionStrategy	Removed.
MSSqlDBConfig	N/A (value type)	property	mssqlUser	Removed.

API object	Path	Type	Name	Change
MSSqlLinkedSource	N/A (value type)	property	config sharedBack upLocations ingestionS trategy mssqlNetba ckupConfig mssqlCommv aultConfig	Removed.
MSSqlSourceSyncStrategy	N/A (value type)	property	config	Optional while creating.
NoBackupIngestionStrategy	N/A (value type)	API Type	NoBackupIn gestionStr ategy	Removed.
OracleLinkFormExternal	N/A (value type)	property	config	Extends reference changed from OracleBaseLinkData to OracleBaseExternalLinkD ata. Config property removed.
OraclePDBLinkFromExternal	N/A (value type)	property	config	Extends reference changed from OracleBaseLinkData to OracleBaseExternalLinkD ata. Configproperty removed.
OracleTimeflow	N/A (value type)	property	tdeUUID	No Longer behind feature flag ORACLEMTTDE.

API object	Path	Type	Name	Change
OracleVirtualPdbSource	N/A (value type)	property	parentTdeKeystorePath parentTdeKeystorePassword tdeExportedKeyFileSecret tdeUUID	No Longer behind feature flag ORACLEMTTDE.
Source	N/A (value type)	property	config	nameParent changed from config to container. Configproperty removed from properties and list operation.
SsoFailedLoginRecord	N/A (value type)	property	userAgent originIp reason	Extends reference changed from TypedObject to FailedLoginRecord. All properties removed.
SsoSuccessfulLoginRecord	N/A (value type)	property	userAgent originIp	Extends reference changed from TypedObject to LoginRecord. Properties removed.

What's new?

API object	Path	Type	Name	Description
AppDataCompatibilityCriteria	N/A (value type)	API Type	AppDataCompatibilityCriteria	The compatibility criteria to use for filtering the list of available AppData repositories.

API object	Path	Type	Name	Description
AppDataSource	N/A (value type)	property	config	Reference to the configuration for the source.
ASESource	N/A (value type)	property	config	Reference to the configuration for the source.
FailedLoginRecord	N/A (value type)	API Type	FailedLoginRecord	Represents an successful login using an external identity provider.
LoginRecord	N/A (value type)	API Type	LoginRecord	Represents a failed SSO login.
MSSqlDelphixManagedSyncStrategy	N/A (value type)	property	config	Reference to the configuration for the source.
MSSqlExternalManagedSourceSyncStrategy	N/A (value type)	property	config	Reference to the configuration for the source.
MSSqlLinkedSource	N/A (value type)	property	syncStrategy overrideMapsTo	Sync strategy for this source. Override mapsTo property for the query parameter defined in list at the root type.
MSSqlStagingSource	N/A (value type)	property	config	Reference to the configuration for the source.
MSSqlUser	N/A (value type)	property	config	Reference to the configuration for the source.
MySQLSource	N/A (value type)	property	config	Reference to the configuration for the source.

API object	Path	Type	Name	Description
OAuth2Config	/service/oauth2	API Type	OAuth2Config	OAuth2 Configuration.
OAuth2FailedLoginRecord	N/A (value type)	API Type	OAuth2FailedLoginRecord	Represents a failed OAuth2 login.
OAuth2SuccessfulLoginRecord	N/A (value type)	API Type	OAuth2SuccessfulLoginRecord	Represents a successful OAuth2 login.
OracleBaseExternalLinkData	N/A (value type)	API Type	OracleBaseExternalLinkData	Represents common parameters to link all externally managed Oracle databases.
OracleSourceBasedSyncStrategy	N/A (value type)	API Type	OracleSourceBasedSyncStrategy	Base type for Oracle source based sync strategy and associated parameters.
OracleSource	N/A (value type)	property	config	Reference to the configuration for the source.
OracleSyncStrategy	N/A (value type)	API Type	OracleSyncStrategy	Base type for Oracle sync strategy and associated parameters.
OracleVirtualPdbSource	N/A (value type)	property	tdeKeyIdentifier	ID of the key created by Delphix, as recorded in encryption_keys.key_id.
OracleVirtualSource	N/A (value type)	property	newDBID	Indicates whether Delphix will generate a new DBID during VDB provision or refresh.

API object	Path	Type	Name	Description
OsAdminStatus	/osadmin/ engineStatus	API Type	OsAdminStatus	Information for the current state of the Delphix Engine.
PgSQLSource	N/A (value type)	property	config	Reference to the configuration for the source.
PluginManifest	N/A (value type)	property	hasVirtualCleanup	Indicates whether virtual.cleanup() operation has been implemented.
ReplicationSourceState	N/A (value type)	property	lastKnownTargetVersion	The Delphix version of the target engine during the last replication using the spec.
ReplicationTargetState	N/A (value type)	property	lastKnownSourceVersion	The Delphix version of the source engine during the last replication of the namespace.

## API changes in Delphix 6.0.10.0

In Delphix 6.0.10.0, the new API version is 1.11.10. This section describes all API changes since API version 1.11.9, which was released with Delphix 6.0.9.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed?

API object	Path	Type	Name	Change
CredentialsEnvVars	N/A (value type)	API Type	Credentials EnvVars	Extends reference changed from TypedObject to IdentifiableArrayElement.
CredentialsEnvVars	N/A (value type)	property	baseVarName credentials	Optional for an update. Optional for update.
IscsiTarget	/storage/ iscsi/target	property	state	Added enum value ERROR.
KeyPairCredential	N/A (value type)	property	privateKey publicKey	Required for create. Optional for update.
NetworkRoute	/network/ route	property	list	Add enum value protocol in "cliDisplay".
Operation	N/A (value type)	API Type	Operation	Extends reference changed from TypedObject to IdentifiableArrayElement.
OracleDatabaseContainer	N/A (value type)	property	racMaxInstanceLag	FeatureFlag 'ORACLERACMAXINSTANCE LAG' is removed. default value changed to 3.
OracleExportParameters	N/A (value type)	property	filesystemLayout	Extends reference changed from TimeFlowFilesystemLayout to OracleExportTimeflowFilesystemLayout

API object	Path	Type	Name	Change
SystemInitializationParameters	N/A (value type)	property	devices	Optional while creating.
TimeZone	/timezone	property	id	Removed values for enum - "ACT", "AET", "AGT", "ART", "AST", "SST", "US/Pacific-New", "VST".

### What's new?

API object	Path	Type	Name	Description
BlobObjectStoreAccesses	N/A (value type)	API Type	BlobObjectStoreAccess	Blob object store access
BlobObjectStoreAccessKey	N/A (value type)	API Type	BlobObjectStoreAccessKey	Blob object store access key
BlobObjectStoreAccessManagedIdentities	N/A (value type)	API Type	BlobObjectStoreAccessManagedIdentities	Blob object store access through Managed Identities
ObjectStoreCacheHitsReport	N/A (value type)	API Type	ObjectStoreCacheHitsReport	A cache hits report for an object store
ObjectStoreTestResult	N/A (value type)	API Type	ObjectStoreTestResult	An object store connectivity test result
ObjectStoreTest	N/A (value type)	API Type	ObjectStoreTest	An object store connectivity test object

API object	Path	Type	Name	Description
ObjectStore	/storage/objectStorage	Standard operations	read  update	Retrieve the specified ObjectStore object  Update the specified ObjectStore object
ObjectStore	/storage/objectStorage	Root operations	testConnection  cacheHitsReport  clearCacheHits	Test connectivity to an object store  Get a ZettaCache hits-by-size report  Clear the accumulated ZettaCache hits-by-size data

## API changes in Delphix 6.0.9.0

In Delphix 6.0.9.0, the new API version is 1.11.9. This section describes all the API changes since API version 1.11.8, which was released with Delphix 6.0.8.0. All URL paths are relative to `/resources/json/delphix`.

### What changed

API object	Path	Type	Name	change
AppDataProvisionParameters	N/A (value type)	property	sourceConfig	Type changed from AppDataSourceConfig to AppDataDirectSourceConfig.
BaseSupportBundleParameters	N/A (value type)	property	bundleType	Added enum value DOCKER_LOG.
CipherSuite	/service/tls/cipherSuite	property	name	Added enum values TLS_AES_128_CCM_8_SHA256, TLS_AES_128_CCM_SHA256, TLS_AES_128_GCM_SHA256, TLS_AES_256_GCM_SHA384, and TLS_CHACHA20_POLY1305_SHA256.
HttpConnectorConfig	/service/httpConnector	property	tlsVersions	Added enum value TLSv1_3.
Namespace	/namespace	property	locked	No longer behind a feature flag.
OracleCluster	/environment	property	name version	No longer read-only Deleted.
ReplicationSpec	N/A (value type)	property	lockedProfile	No longer behind a feature flag.

API object	Path	Type	Name	change
WindowsCluster	/environment	property	name	No longer read-only.

### What is new

API object	Path	Type	Name	Description
AlertProfile	/alert/profile	property	user	User to which the alert profile is assigned. Defaults to the logged-in user.
CredentialsEnvVars	N/A (value type)	API type	CredentialsEnvVars	Credentials to be placed in environment variables for an operation.
IscsiTargetDiscoverParameters	N/A (value type)	property	chapUsername chapPassword chapUsernameIn chapPasswordIn	CHAP username to be used for iSCSI Discovery. CHAP password to be used for iSCSI Discovery. Target/Mutual CHAP username to be used for iSCSI Discovery (bidirectional authentication). Target/Mutual CHAP password to be used for iSCSI Discovery (bidirectional authentication).
IscsiTarget	/storage/iscsi/target	property	chapUsername chapPassword chapUsernameIn chapPasswordIn	CHAP username to be used for iSCSI Target authentication. CHAP password to be used for iSCSI Target authentication. Target/Mutual CHAP username (bidirectional authentication). Target/Mutual CHAP password (bidirectional authentication).

API object	Path	Type	Name	Description
SourceOperation	N/A (value type)	property	credentials EnvVarsList	List of environment variables that will contain credentials for this operation.
SystemVersion	/system/ version	property	hotfixVersion	The hotfix version.

## API changes in Delphix 6.0.8.0

In Delphix 6.0.8.0, the new API version is 1.11.8. This section describes all API changes since API version 1.11.7, which was released with Delphix 6.0.7.0. All URL paths are relative to `/resources/json/delphix`.

### What changed

API object	Path	Type	Name	Change
AttachData	N/A (value type)	property	config	Deleted.
Container	/database	operation	undo	HTTP method changed from GET to POST.
LinkData	N/A (value type)	property	config	Deleted.
MSSqlAttachData	N/A (value type)	property	backupLocationCredentials backupLocationUser/ source config externalFilePath ingestionStrategy mssqlDefaultConfig mssqlNetbackupConfig mssqlUser sharedBackupLocations	Deleted. (See the new syncStrategy property in the table below.)

API object	Path	Type	Name	Change
MSSqlLinkData	N/A (value type)	property	backupLocationCredentials backupLocationUser config externalFilePath ingestionStrategy mssqlCommunityConfig mssqlNetBackupConfig mssqlUser sharedBackupLocations	Deleted. (See the new syncStrategy property in the table below.)
MSSqlLinkedSource	/source	property	backupLocationCredentials backupLocationUser externalFilePath	Deleted.
NamespaceFailoverParameters	N/A (value type)	property	smartFailover	Default changed to true.
OracleSyncFromExternalParameters	N/A (value type)	property	filesForFullBackup	No longer behind a feature flag.

API object	Path	Type	Name	Change
SourceIngestionData	N/A (value type)	property	containerType	Removed obsolete value VMWARE_CONTAINER from enum.
SourceRepository	/repository	property	linkingEnabled	Deleted.
SourceTypeAggregateIngestedSize	N/A (value type)	property	containerType	Removed obsolete value VMWARE_CONTAINER from enum.
Source	/source	property	status	Removed value DETACHED from enum.
VMware*		API types	VMware*	Deleted all types whose names start with VMware (obsolete).

### What is new

API object	Path	Type	Name	Description
AdvancedSettingsInfo	/system/advancedSettings	API type	AdvancedSettingsInfo	Set advanced virtualization, OS, network, and service tunables.
ASESnapshot	/snapshot	property	dbEncryptionKey	Name of database encryption key present for this snapshot.
IscsiInitiator	/storage/iscsi/initiator	API type	IscsiInitiator	Endpoint for iSCSI initiator information.
MSSqlAttachData	N/A (value type)	property	syncStrategy	Configuration that determines what sync strategy the source will use.

API object	Path	Type	Name	Description
MSSqlDelphixManagedSyncStrategy	N/A (value type)	API type	MSSqlDelphixManagedSyncStrategy	MSSQL specific parameters for delphix managed source based sync strategy.
MSSqlExternalManagedSourceSyncStrategy	N/A (value type)	API type	MSSqlExternalManagedSourceSyncStrategy	MSSQL specific parameters for externally managed source based sync strategy.
MSSqlLinkData	N/A (value type)	property	syncStrategy	Configuration that determines what sync strategy the source will use for linking.
MSSqlSourceSyncStrategy	N/A (value type)	API type	MSSqlSourceSyncStrategy	MSSQL specific parameters for source based sync strategy.
MSSqlSyncStrategy	N/A (value type)	API type	MSSqlSyncStrategy	Base type for mssql specific parameters for sync strategy.
Namespace	/namespace	property	locked	Indicates the namespace is locked. (Behind the DATA_VAULT feature flag.)
OracleDatabaseContainer	/container	property	racMaxInstanceLag	Maximum number of log sequences that a node can lag behind on RAC before considering instance offline. (Behind the ORACLERACMAXINSTANCELAG feature flag.)
ReplicationSpec	N/A (value type)	property	lockedProfile	Indicates the replication profile is locked. (Behind the DATA_VAULT feature flag.)

API object	Path	Type	Name	Description
SyncStrategy	N/A (value type)	API type	SyncStrate gy	Base type for specific parameters for sync strategy.
Tunable	N/A (value type)	API type	Tunable	The name of the tunable and its value.
TunableIdentifier	N/A (value type)	API type	TunableIde ntifier	The subsystem and name for a tunable.

## API changes in Delphix 6.0.7.0

In Delphix 6.0.7.0, the new API version is 1.11.7. This section describes all API changes since API version 1.11.6, which was released with Delphix 6.0.6.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed

API object	Path	Type	Name	Change
PgSQLDBClusterConfigConnectivity	N/A (value type)	API type	PgSQLDBClusterConfigConnectivity	Deleted.
OracleBaseDBConfig	/sourceconfig	property	nonSysCredentials	Changed type from PasswordCredential to Credential.
OracleLinkFromExternal	N/A (value type)	property	nonSysCredentials	Changed type from PasswordCredential to Credential.
ReplicationSecureList	N/A (value type)	API type	ReplicationSecureList	No longer behind feature flag MDD.
SNMPV3Manager	/service/snmp/v3/manager	property	username	Introduced a minimum length of 1.
Source	/source	property	statuses	Added DETACHED to the list of possible values.

## What 's new

API object	Path	Type	Name	Description
AbstractToolkit	/toolkit	root operation	schema Definitions	Get the platform's JSON schema definitions that plugin schemas can reference.
ASESyncParameters	N/A (value type)	property	dropAndRecreateDevices	If this parameter is set to true, it will drop the older devices and create new devices during manual sync operations instead of trying to remap the devices. This might increase the space utilization on Delphix Engine.
NamedKeyPairCredential	N/A (value type)	API type	NamedKeyPairCredential	Username and key-pair credential.
NamedPasswordCredential	N/A (value type)	API type	NamedPasswordCredential	Pair of username and password credential.
OracleSyncFromExternalParameters	N/A (value type)	property	filesForFullBackup	List of datafiles to take a full backup of. This would be useful in situations where certain datafiles could not be backed up during previous SnapSync due to corruption or because they went offline.
SsoConfig	/service/sso	property	entityId	Audience Restriction (SP entity ID, Partner's Entity ID) of this engine as an SSO service provider.

API object	Path	Type	Name	Description
SsoConfig	/service/sso	property	responseSkewTime	Maximum time difference allowed between a SAML response and the engine's current time, in seconds. If not set, it defaults to 86,400 seconds (one day).
SsoConfig	/service/sso	property	maxAuthenticationAge	How far in the past to accept authentications to the identity provider, in seconds. If not set, it defaults to 120 seconds.
SupportBundleConfiguration	/service/support/bundle	property	maxActions	Maximum number of actions not referenced anywhere else to include from the metadata store. The most recent such actions are included.
SupportBundleConfiguration	/service/support/bundle	operation	read	Retrieve the specified SupportBundleConfiguration object.
SupportBundleConfiguration	/service/support/bundle	operation	update	Update the specified SupportBundleConfiguration object.

## API changes in Delphix 6.0.6.0

In Delphix 6.0.6.0, the new API version is 1.11.6. This section describes all API changes since API version 1.11.5, which was released with Delphix 6.0.5.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed

API object	Path	Type	Name	Change
OracleMultitenantProvisionParameters	N/A (value object)	object property	timeflowPointParameters	The source timeflow point can now reference an Oracle non-multitenant database. In which case the non-multitenant database will be provisioned from the timeflow point to a virtual pluggable database.

## API changes in Delphix 6.0.5.0

In Delphix 6.0.5.0, the new API version is 1.11.5. This section describes all API changes since API version 1.11.4, which was released with Delphix 6.0.4.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed

API object	Path	Type	Name	Change
CloudStatus	/service/cloud	property	delphixDataServicesComponentStatus	Made read-only for update.
CloudStatus	/service/cloud	property	delphixDataServicesComponentInfo	Made read-only for update.
CloudStatus	/service/cloud	root operation	enable	Added optional payload CloudEnableParameters.
OracleDBConfig	/sourceconfig	property	tdeKeystorePassword	Impose a maximum length of 256.
OracleInstance	N/A (value object)	property	instanceNumber	Change type from number to integer.
OracleSnapshot	/snapshot	property	redoLogSizeInBytes	Change type from number to integer.
OracleStartParameters	N/A (value object)	property	instances	Change type from number to integer.
OracleStopParameters	N/A (value object)	property	instances	Change type from number to integer.
TimeZone	/timezone	property	id	Added enum values America/Nuuk and Asia/Qostanay.

## What's new

API object	Path	Type	Name	Description
CloudEnableParameters	N/A (value object)	value type	CloudEnableParameters	Parameters to the Cloud Enable operation
CloudStatus	/service/cloud	property	proxyMode	Whether an HTTP proxy must be used to connect to Central Management.
CloudStatus	/service/cloud	property	proxyConfiguration	Proxy configuration for communication with Delphix Central Management. This property is ignored unless the 'proxyMode' property is set to CLOUD_SPECIFIC_SETTING.
CloudStatus	/service/cloud	operation	update	Update the specified CloudStatus object. Payload is a CloudStatus.
HostConfiguration	N/A (value object)	property	powerShellVersion	The PowerShell version installed on the windows target host.
OracleSTConvertedToPDBAttachData	N/A (value object)	value type	OracleSTConvertedToPDBAttachData	Sub-type of OraclePDBAttachData.
OracleTimeflow	/timeflow	property	tdeUUID	Unique identifier for TimeFlow-specific TDE objects that reside outside of Delphix storage.
OracleVirtualPdbSource	/source	property	parentTdeKeystorePassword	The password of the keystore specified in parentTdeKeystorePath.

API object	Path	Type	Name	Description
OracleVirtualPdbSource	/source	property	tdeExportedKeyFileSecret	Secret to be used while exporting and importing vPDB encryption keys if Transparent Data Encryption is enabled on the vPDB.
OracleVirtualPdbSource	/source	property	tdeUUID	Unique identifier for PDB-specific TDE objects that reside outside of Delphix storage.
StaticHostAddress	/service/host/address	new API	StaticHostAddress	Static mapping of hostname to IP address.
WindowsHost	/host	property	connectorVersion	The Windows Connector version that is installed on the provided host.
WindowsHost	/host	property	connectorDotNetFrameworkVersion	The .NET Framework version used for Windows Connector Service.

## API changes in Delphix 6.0.4.0

In Delphix 6.0.4.0, the new API version is 1.11.4. This section describes all API changes since API version 1.11.3, which was released with Delphix 6.0.3.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed

API object	Path	Type	Name	Change
OracleDBConfigConnectivity	N/A (value object)	object property	password	Name changed to credentials Type changed to Credential
OracleBaseAttachData	N/A (value object)	object property	oracleFallbackCredentials	Type changed to Credential
OracleBaseDBConfig	/sourceconfig	object property	credentials	Type changed to Credential
OracleBaseLinkData	N/A (value object)	object property	oracleFallbackCredentials	Type changed to Credential
OracleDatabaseContainer	/database	object property	tdeProvisioningEnabled	Deleted
OracleManagedSource	/source	object property	mountBase	Format is now unixrestrictedpath
OracleVirtualPdbSource	/source	object property	parentTdeKeystorePath	Format is now unixrestrictedpath
UnixRuntimeMountInformation	N/A (value object)	object property	nfsVersionReason	Added enum value INCOMPLETE_V4_CONFIG

API object	Path	Type	Name	Change
X500DistinguishedNameComposite	N/A (value object)	object property	dnname	Minimum length is now 1

### What's new

API object	Path	Type	Name	Description
X509Certificate	/service/certificate	new API	X509Certificate	X509 Certificate.

## API changes in Delphix 6.0.3.0

In Delphix 6.0.3.0, the new API version is 1.11.3. This section describes all API changes since API version 1.11.2, which was released with Delphix 6.0.2.0. All URL paths are relative to `/resources/json/delphix`.

### What's changed

API object	Path	Type	Name	Change
ApplyVersionParameters	N/A (value object)	object property	verify	Default changed from true to false.
OracleBaseAttachData	N/A (value object)	object property	dbUser dbCredentials	<p>Name changed to oracleFallbackUser. The database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures).</p> <p>Name changed to oracleFallbackCredentials. The password for the database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures).</p>
OracleBaseLinkData	N/A (value object)	object property	dbUser dbCredentials	<p>Name changed to oracleFallbackUser. The database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures).</p> <p>Name changed to oracleFallbackCredentials. The password for the database user. Optional if bequeath connections are enabled (to be used in case of bequeath connection failures).</p>
Plugin	/toolkit	object property	status	Deleted

## What's new

API object	Path	Type	Name	Description
AbstractToolkit	/toolkit	object property	status	The status of the toolkit. ACTIVE indicates toolkit is actively referenced and in use. INACTIVE means toolkit needs to go through a manual upgrade operation before it can be used.
Certificate	/service/tls/caCertificate /service/tls/endEntityCertificate	object property	isCertificateAuthority	Whether this certificate is a Certificate Authority (CA).
ConfiguredStorageDevice	/storage/device	object property	fragmentation	Percent fragmentation for this device.
CyberArkVaultCredential	N/A (value object)	subclass of Credential	CyberArkVaultCredential	CyberArk vault based security credential.
DNSConfig	/service/dns	object property	source	The source of the DNS configuration (STATIC or DHCP).
HashiCorpVaultCredential	N/A (value object)	subclass of Credential	HashiCorpVaultCredential	HashiCorp vault based security credential.
LicenseInfo	/license	object	LicenseInfo	Retrieve all external licenses.
NetworkDSPTestParameters	N/A (value object)	object property	xportScheduler	The transport scheduler to use.
OracleInstall	/repository	object property	oracleBaseConfig oracleBaseHome	The Oracle Base Config directory. The Oracle Base Home directory.

API object	Path	Type	Name	Description
OracleVirtualPdbSource	/source	object property	parentTdeKeystorePath	Path to a copy of the parent's Oracle transparent data encryption keystore on the target host. Required to provision from snapshots containing encrypted database files.
PasswordVault	/service/passwordVault	new API	PasswordVault	Password vault configuration.
Plugin	/toolkit	object property	luaName minimumLuaVersion	The name of the LUA toolkit that this plugin can upgrade. The minimum version (in major.minor format) of a LUA toolkit that this plugin can upgrade.
RunDefaultPowerShellOnSourceOperation	N/A (value object)	subclass of SourceOperation	RunDefaultPowerShellOnSourceOperation	A user-specifiable operation that runs a PowerShell command (using default version) on the target host.
SnapshotCapacityData	/capacity/snapshot	object property list parameter	namespace snapshotTimezone snapshotLatestChange namespace	Reference to the namespace to which this snapshot belongs. Time zone of the source database at the time the snapshot was taken. The timestamp of the latestChangePoint of the associated snapshot. The namespace to list snapshot data for. If null, will limit returned snapshots to the default namespace.

API object	Path	Type	Name	Description
StatisticSlice	/analytics	getData parameter	count	The number of data points to return. Mds data points will be combined in order to to meet this requirement. When count is specified at least two of the other getData parameters must be specified.
SystemInfo	/system	object property	poolFragmentation	Percent fragmentation for the domain0 pool.

## Support matrices

This section covers the following topics:

- [Oracle matrix](#)
- [SQL server matrix](#)
- [SAP ASE matrix](#)
- [IBM Db2 matrix](#)
- [PostgreSQL matrix](#)
- [SAP HANA matrix](#)
- [Oracle E-Business Suite \(EBS\) matrix](#)
- [Kerberos support matrix](#)
- [Data source certifications](#)
- [Virtualization platform matrix](#)
- [vFiles matrix](#)
- [Windows connector matrix](#)
- [Select connectors matrix](#)

## Oracle matrix

### Disclaimers and support notes

Delphix Support Policies specifically list **major** and **minor** release coverage. If a minor release is listed as covered, all patch releases under that minor release are certified. Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL), 64-bit OS support only.

The Oracle version in the support matrix applies to both Oracle DB and Oracle Grid. Delphix supports the same set of features and functionality for supported non-multitenant database versions. Currently, Delphix does not support the Oracle 12c feature of `THREADED_EXECUTION` being set to `TRUE`, because this disables OS authentication.

Summary of Delphix features that are unsupported for the Oracle12c and higher Multi-tenant configuration:

- Existing Virtual Container Database (vCDB) as target for provisioning an additional vPDB for Oracle version 12.1.0.1
- Customize VDB settings/initialization parameters. Includes the following:
  - Customize `init.ora` database parameter during provisioning
  - Config templates
  - Online redo log size
  - Number of RAC VDB instances
  - Online redo log groups
  - Archive log mode
  - Setting new DBID
  - Customize local listeners
- Virtual to Physical (V2P) Support
- Resumable initial SnapSync
- Validated Sync
- Source continuity for dSource upgraded from Oracle 12c non-multitenant to multitenant database
- Cross-platform provisioning (XPP) to the virtual database
- Oracle LiveSources

Delphix supports systems that are part of an Exadata or Exadata Cloud-at-Customer (ExaCC) cluster, provided that the operating system and DBMS version are in the supported list. Oracle Exadata, Exadata Cloud, and Exadata Cloud-at-Customer (ExaCC) offer several features that are reliant on the underlying Exadata storage. Delphix supports creating dSources from Exadata source clusters and provisioning VDBs and vPDBs to Exadata target clusters.

The following Exadata-only features will not be available in child VDBs running in Delphix storage:

- Smart Scan - allows SQL processing to be offloaded to Exadata storage cells. Queries that leverage Smart Scan will execute successfully in VDBs but query performance may be impacted.
- Smart Flash Cache - allows frequently used data blocks to be stored in the flash cache of Exadata storage cells to allow for faster access. Queries against objects that are normally cached in Smart Flash Cache will execute successfully in VDBs but query performance may be impacted. As the virtualization engine uses memory to cache frequently used data blocks, allocating extra memory to the engine may help to mitigate this performance impact.
- Hybrid Columnar Compression (HCC) - compresses data and stores it in a columnar format, allowing Exadata storage cells to deliver faster query performance while also saving on storage. Columns compressed using HCC cannot be used by queries executed in VDBs. Affected columns can be decompressed though care should be taken to evaluate the impact of doing so on VDB refresh times and Delphix storage usage. In Delphix VDBs, queries against partitions or tables using HCC will fail with the following error "*ORA-64307: Exadata Hybrid Columnar Compression is not supported for tablespaces on this storage type*".

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

### Oracle database editions

Delphix supports the following Oracle database editions:

- Enterprise
- Standard

### Red Hat Enterprise Linux (RHEL)

 Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please refer to [KBA 5622](#) for the required steps.

## IBM Db2 matrix

### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

### Key:

Color	Supported?
Y	Yes
N	No

### Red Hat Enterprise Linux (RHEL)

Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

### Db2 plugin support for below mentioned OS and Db2 versions

Supported OS version	Supported DBMS version		
	10.5	11.1	11.5
RHEL 6.9	Y	Y	N
RHEL 7.0	Y	Y	N

10.0.0.x	N	N	N	N	N	N	N	Y	Y	Y	Y	Y	Y

### Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions. The following points describe why staging server is not accessible with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
  - a. On staging server, PostgreSQL plugin setups warm standby till version 9.x, which indicates that you cannot access PostgreSQL database on staging instance with PostgreSQL 9.4 and PostgreSQL 9.5 versions or even dSource for READ-ONLY workload. However, in later versions it is possible to trigger READ-ONLY query on dsource.
  - b. In PostgreSQL version 9.x, the plugin sets *wal\_level* parameter on staging server PostgreSQL instance to *archive*. However for PostgreSQL version 10 and later, PostgreSQL plugin sets *wal\_level* parameter on staging server PostgreSQL instance to *hot\_standby* or *replica*.

**Info**

- i. **Warm Standby/Log Shipping** is a HA solution which 'replicates' a database cluster to an archive or a warm (can be brought up quickly, but not available for querying) standby server. Overhead is very low and it's easy to set up. This is a simple and appropriate solution if all you care about is continuous backup and short failover times.
- ii. **Hot Standby/Streaming Replication** provides asynchronous binary replication to one or more standbys. Standbys may also become hot standbys meaning they can be queried as a read-only database. This is the fastest type of replication available as WAL data is sent immediately rather than waiting for a whole segment to be produced and shipped. In *hot\_standby* level, the same information is logged as with *archive*, plus information needed to reconstruct the status of running transactions from the WAL. To enable read-only queries on a standby server, *wal\_level* must be set to 'hot\_standby' or higher on the primary, and *hot\_standby* must be enabled in the standby.  
 Dsource created in PostgreSQL 9.4 & 9.5 version is a warm standby so it is not accessible. *wal\_level* determines how much information is written to the WAL. The default value is minimal, which writes only the information needed to recover from a crash or immediate shutdown. *archive* adds logging required for WAL archiving; *hot\_standby* further adds information required to run read-only queries on a standby server; and, finally logical adds

information necessary to support logical decoding. Each level includes the information logged at all lower levels. This parameter can only be set at server/instance level.

- There are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

## SAP HANA matrix

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Supported DBMS versions

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

 A target may have a higher SPS release than a source; the reverse is not supported.

#### Key:

Color	Supported?
Y	Yes
N	No

### Supported operating system

Supported OS version	Supported DBMS version	
	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
RHEL 7.9	Y	Y
RHEL 8.1	Y	Y
RHEL 7.3/7.4/7.5	Y	N

RHEL 7.6	Y	Y
SUSE 12 SP 03	Y	N
SUSE 15 SP 02	N	Y

### Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Lua-based plugin						vSDK-based Plugin								
Delphi x Engine	4.1 .1	4.1. 2	4.2. 0	4.3.0	4.3. 1	4.3. 2	6.0. 0	6.0. 1	6.1. 0	6.1. 1	6.2. 0	6.2. 1	6. 3. 0	6. 3. 1

9.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
10.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

### Compatibility Limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

## Oracle E-Business Suite (EBS) matrix

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#).

Plugin upgrade path for EBS 12.2 customers

**i** The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0/4.2.1/4.2.2. plugin for EBS 12.2 customers.

Existing EBS customers with different plugin version

Your version	Recommended upgrade path to 4.2.2
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.
4.2.0 4.2.1	Upgrade directly to version 4.2.2.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0 → 4.2.1 → 4.2.2.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0 → 4.2.1 → 4.2.2.

Unsupported EBS versions and features

- Support SSL enabled Environment
- V2P

## Kerberos support matrix

Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Key:

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

### Oracle - Red Hat Enterprise Linux (RHEL)

Supported OS Version	Supported DBMS Version

RHEL 7.1	Y	Y	Y	Y
RHEL 7.2	Y	Y	Y	Y
RHEL 7.3	Y	Y	Y	Y
RHEL 7.4	Y	Y	Y	Y

 DB2 11.1 Developer Edition has been certified on RHEL 6.7.

### DB2 on Advanced Interactive eXecutive (AIX)

Supported OS Version	Supported DBMS Version			
	ESE 10.5	AESE 10.5	ESE 11.1	AESE 11.1
AIX 6.1	N	N	NA	NA
AIX 7.1	Y	Y	Y	Y
AIX 7.2	Y	Y	Y	Y

## Data source certifications

### Legal notice

**IMPORTANT:** The policies outlined in this document are subject to change. The policies and timelines are provided as rough estimates when certifications of interoperability/connectivity with third-party products may be completed and are subject to whether such interoperability/connectivity is part of the Delphix product roadmap and support policy and should not be regarded as a commitment.

Speak with Delphix Product Management if you need more specific information or are unsure of these policies.

### Goals

The goal of this certification cadence is to maintain a cadence for certifications of new software releases.

The objectives are:

1. To set reasonable expectations for our organization and customers regarding how and when we will address certifications
2. To define an intended timeframe for certification of new data sources versions and operating systems versions to maintain an up-to-date support matrix

Certification expectations:

Please note that certification only covers previously supported functionality of the Delphix Engine. Any new features and functionality introduced in the database or operating system (DB/OS) will be tracked through the regular release planning and roadmap process and considered as features/functionality/fixes.

Specifically, the following paths exist with varying delivery timeline commitments, in the following priority order:

1. [Security Response Policy](#): In case security issues are discovered in a certain DB and/or OS version, we will follow our security response policy, which supersedes the goals described in this document.
2. Certifications: As described in the document.
3. Roadmap Features: No policies outlined. This follows the regular roadmap planning process.

### Data sources

This documentation currently applies only to the following data source integrations:

- Oracle
- SQL Server
- SAP ASE

### Cadence for data source database version changes

Release type	Certification details	Goal
A new version of a database with all currently supported operating systems	Certification with all supported operating systems	8 months from new version GA date

## Cadence for operating system version changes

Release type	Certification details	Goal
A new major operating system version with all currently supported databases	Certification with all supported versions of the database	6 months from new version GA date
A new update* operating system version with all currently supported databases	Certification with all supported versions of the database	4 months from new version GA date

\*Terminology for an 'update' version varies across operating systems. See the Appendix for more information.

## Appendix

Product lifecycle of Oracle related DB/OS vendors:

Software	Product lifecycle	Notes
Oracle Database	<a href="#">Link</a>	12.1 is <a href="#">Oracle Enterprise Edition (EE)</a>
Red Hat Enterprise Linux	<a href="#">Link</a>	
Solaris (x86 and SPARC)	<a href="#">Link</a>	
SuSE Linux (SLES)	<a href="#">Link</a>	
IBM AIX	<a href="#">Link</a>	
HP-UX	<a href="#">Link</a>	

Product lifecycle of SQL server related DB/OS vendors:

Software	Product Lifecycle
Microsoft SQL Server	<a href="#">Link</a>
Microsoft Windows	<a href="#">Link</a>

Product lifecycle of SAP ASE related DB/OS vendors:

Software	Product Lifecycle
SAP ASE	<a href="#">Link</a>
Red Hat Enterprise Linux	<a href="#">Link</a>
Solaris (x86 and SPARC)	<a href="#">Link</a>
SuSE Linux (SLES)	<a href="#">Link</a>
IBM AIX	<a href="#">Link</a>

#### Footnote 1: Update version terminology

Operating System releases typically include updated versions, the terminology for which varies depending on the vendor. Below are the various operating systems which we support, as well as the terminology for updates to use with the document above.

Vendor	Update version terminology	Definition
Red Hat Enterprise Linux	Update version	Installed on top of major releases to provide larger-scale point-release updates via Red Hat Network, after initial installation via traditional methods (PXE, DVD, etc.).
Solaris (x86 and SPARC)	Update release	Update release number. The update release number for this Oracle Solaris release. The update value is 0 for the first customer shipment of an Oracle Solaris release, 1 for the first update of that release, 2 for the second update of that release, and so forth.
SuSE Linux (SLES)	Service Pack (SP) release	Service Packs are minor updates and enhancements, usually with security fixes, that are applied to the major version of the OS.
IBM AIX	Service Pack (SP) release	A Technology Level (TL) gives new features, while an SP contains fixes for problems that are critical and can't wait until the next TL. Service Packs are limited to minimal corrections that don't change the way things work or add any new functionality.

<b>Vendor</b>	<b>Update version terminology</b>	<b>Definition</b>
HP-UX	Patch release	Patch sets are groups of patches that should be installed to support common HPE products and sub-systems.
Windows	New Release (R) version or Service Pack (SP) release	A service pack (SP) is a collection of updates and fixes, called patches, for an operating system or a software program. Many of these patches are often released before a larger service pack, but the service pack allows for an easy, single installation.

## Virtualization platform matrix

### Legend

Color	Supported?

	Resumable V2P	Y	Y	Y	Y	NA	N	N	N	N	N	N	N	N	N	N

### Data platform features

This section describes the data platform-specific features we support for each use case within Delphix.

\*Non-Multitenant TDE support does not apply to vPDBs.

 Multitenant TDE support applies to vPDBs starting with Oracle version 12cR2 (12.2) and above.

\*Oracle databases can have some tables that are HCC-enabled and some that are not; Delphix can ingest a database with HCC-enabled tables and can successfully provision a VDB. The caveat to this is that attempts to read data from the HCC-enabled tables on a provisioned VDB will fail. This happens because Oracle requires the backing storage to be fully supported for HCC, but uncompressed tables can be used as expected with non-HCC tables. Please note that Oracle only recommends HCC for tables or partitions with little to no DML operations. Another possible solution is creating hook operations to uncompress the HCC-enabled tables/partitions to access the data, this method is outlined in a [Delphix Community](#) post.

### Oracle

Platform Feature	Oracle					
	11g	12cR1 (12.1)	12cR2 (12.2)	18c	19c	21c

Platform Feature		Oracle

## SUSE Linux Enterprise Server (SLES)

<b>Delphix AppData Version</b>	<b>6.0+</b>
<b>Supported OS Version (x86_64)</b>	
SLES 11	Y
SLES 11 SP1	Y

## Solaris

<b>Delphix AppData Version</b>	<b>6.0+</b>
<b>Supported OS Version (SPARC x86_64)</b>	
Solaris 10	Y
Solaris 11	Y

## AIX

<b>Delphix AppData Version</b>	<b>6.0+</b>
<b>Supported OS Version (Power)</b>	
AIX 6.1	Y
AIX 7.1	Y
AIX 7.2	Y

## HP-UX

<b>Delphix AppData Version</b>	<b>6.0+</b>
<b>Supported OS Version (IA64)</b>	
HP-UX 11i v3 (11.31)	Y

## Windows environments

<b>Delphix AppData Version</b>	<b>6.0+</b>
<b>Supported OS Version</b>	
Windows Server 2012	Y
Windows Server 2012 R2	Y
Windows Server 2016	Y
Windows Server 2019	Y
Windows Server 2022	Y

## Windows connector matrix

You can always download the current Windows connector version from the Delphix Engine from the following locations:

Delphix Dynamic Data Platform versions before 6.0.5.0:

```
http://<name of your Delphix Engine>/connector/DelphixConnectorInstaller.msi
```

Delphix Dynamic Data Platform versions 6.0.5.0 onwards:

```
http://<name of your Delphix Engine>/connector/DelphixConnectorInstaller.exe
```

 The Delphix Connector and Engine are generally backward-compatible.

Delphix connector version 1.18.0 and beyond is compatible with Delphix Engine 6.0.5.0 and later releases.

Delphix connector version 1.17.0 or earlier is compatible with Delphix Engine 6.0.4.0 and earlier releases.

## Checking the Windows connector version

After installing the connector, you can perform the following steps to determine the Windows connector version.

1. Navigate to the Windows Environment.
2. In the search box on the taskbar, type Add or Remove Programs or launch **Start > Control Panel > Programs > Programs and Features**.
3. On the Add or Remove Programs screen, locate Delphix Connector and then click on the software to check the version installed.

## Windows connector matrix

The following table details the supported Windows Connector and JRE versions for the corresponding Delphix Dynamic Data Platform versions.

Delphix Dynamic Data Platform Version	Windows Connector Version	JRE Version
4.2	1.2.0	1.7.0_71 (4.2.5.1)
4.3	1.3.0	1.8.0_40 (4.3.5.1)
5.1.0.0-5.1.4.0	1.4.0	1.8.0_40
5.1.5.0-5.1.6.0	1.5.0	1.8.0_112
5.1.7.0	1.6.0	1.8.0_112

<b>Delphix Dynamic Data Platform Version</b>	<b>Windows Connector Version</b>	<b>JRE Version</b>
5.1.8.0 - 5.1.10.0	1.7.0	1.8.0_112
5.2.0.0-5.2.2.0	1.9.0	1.8.0_131 (5.2.2.1)
5.2.3.0-5.2.4.0	1.10.0	1.8.0_162
5.2.5.0-5.3.3.0	1.12.0	1.8.0_202
5.3.4.0	1.13.0	1.8.0_202
5.3.5.0	1.14.0	1.8.0_202
5.3.6.0-5.3.7.0	1.15.0	1.8.0_202
5.3.8.0-6.0.0.0	1.16.0	1.8.0_202
6.0.1.0-6.0.4.0	1.17.0	OpenJDK 8u242
6.0.5.0-6.0.8.0	1.18.0	OpenJDK 8u262-b10
6.0.9.0-6.0.10.0	1.20.0	OpenJDK 8u282-b08
6.0.11.0	1.21.0.0	OpenJDK 8u302-b08
6.0.12.0	1.22.0.0	OpenJDK 8u302-b08
6.0.12.1	1.22.0.0	OpenJDK 8u302-b08
6.0.13.0	1.23.0.0	OpenJDK 8u302-b08
6.0.13.1	1.23.0.0	OpenJDK 8u302-b08
6.0.14.0	1.23.0.0	OpenJDK 8u302-b08
6.0.15.0	1.24.0.0	OpenJDK8u332-b09
6.0.16.0	1.24.0.0	OpenJDK8u332-b09

<b>Delphix Dynamic Data Platform Version</b>	<b>Windows Connector Version</b>	<b>JRE Version</b>
6.0.17.0	1.27.0.0	OpenJDK 8u345-b01
6.0.17.2	1.27.0.0	OpenJDK 8u345-b01
7.0.0.0	1.27.0.0	OpenJDK 8u345-b01
8.0.0.0	1.27.0.0	OpenJDK 8u345-b01
9.0.0.0	1.28.0.0	OpenJDK 8u362-b09
10.0.0.0	1.29.0.0	OpenJDK 8u362-b09

The following table details the .Net connector version compatibility for the corresponding Windows Connector versions.

<b>.Net Connector Version</b>	<b>Windows Connector Version</b>
3.5	1.17.0 and earlier
3.5 and 4.0+	1.18.0 and higher

### File checksum / hashes

The following table provides the MD5 and SHA256 file hash for recent Delphix versions, in the instance that a security policy requires an exception for software installation.

<b>Delphix Dynamic Data Platform Version</b>	<b>Connector Version</b>	<b>MD5 Hash</b>	<b>SHA256 Hash</b>
6.0.0.0	1.16.0	84616c4f86c0d871127feb26b9b8bd52	bc2e5e4b26c33d739f7be12f53637979481e1371325e0b5c7645462f6cf5f4f3

## Select connectors matrix

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

## Couchbase

### Data source version and OS version

	RHEL 6.x	RHEL 7.0	RHEL 8.0	Windows
Couchbase 6.0	Y	Y	Y	N
Couchbase 6.5	Y	Y	Y	N
Couchbase 6.6	Y	Y	Y	N

### Size in TB / sizing

- No known restrictions.
- Memory, Network, IOPS metrics from Couchbase GUI

### Frequency of refreshes

No specific limitations

### Source backup policy

- Supports backups using Couchbase Backup Manager (cbbkpmgr)
- Supports Couchbase XDCR technology

### Use case (PIT Provisioning, Dev/Test)

- Does not support Point-in-Time Provisioning.
- Not appropriate for high throughput performance requirement.

### Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.

### Timestamp on snapshot metadata

This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

### Architecture options

- Only 1 VDB per host is supported (couchbase restriction of 1 instance per Node)
- Dedicated 1 Staging host is needed for each dSource created using XDCR technology

	<b>Community Edition XDCR only</b>	<b>Enterprise Edition</b>
Couchbase 6.0	Y	Y
Couchbase 6.5	Y	Y
Couchbase 6.6	Y	Y

### Authentication type (LDAP, Kerberos,)

- Kerberos is not supported.
- LDAP not tested.

### Ingestion type (Backup, Dump, Replication, Snapshot)

- Couchbase Backup Manager (cbbkpmgr)
- XDCR

### Link to documentation

<https://delphix.github.io/couchbase-plugin>

## Mongo

### Data Source version and OS version

<b>Supported Mongo Version</b>	<b>mongoDB 4.2.x</b>	<b>mongoDB 4.4.x</b>	<b>mongoDB 5.0.x</b>	<b>mongoDB 6.0.x</b>
RHEL 6.x	Y	Y	Y	Y
RHEL 7.x	Y	Y	Y	Y
RHEL 8.x	Y	Y	Y	Y
CentOS 6.x	Y	Y	Y	Y

Supported Mongo Version	mongoDB 4.2.x	mongoDB 4.4.x	mongoDB 5.0.x	mongoDB 6.0.x
CentOS 7.x	Y	Y	Y	Y
CentOS 8.x	Y	Y	Y	Y
Windows	N	N	N	N

Size in TB / sizing

- Not tested with large datasets.
- Memory, Network, IOPS metrics from Mongo OPS Manager

Frequency of refreshes

No specific limitations

Source backup policy

- Sharded Mongo always ingest full. Non-Sharded mongo ingestion may be full or incremental based on the mechanism used for ingestion.
- Sharded : Full
- Non-Sharded (Using Backups ) - Full
- Non-sharded (Using replicaset member) - incremental
- Mongodump - Full or incremental based on type of source and type of ingestion

Use case (PIT Provisioning, Dev/Test)

- Does not support Point-in-Time Provisioning.
- Not appropriate for high throughput performance requirement.

Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.

Timestamp on snapshot metadata

This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

Architecture options

Sharding

Supported

	Unsharded VDB	Sharded VDB
Unsharded Source >= 3.6	Y	N

	Unsharded VDB	Sharded VDB
Sharded Source >= 4.2	N	Y

Example: Sharded sources are supported, but require backup vendor MongoOPS Manager to create backup.

Authentication type (LDAP, Kerberos,)

- LDAP and SCRAM supported
- Kerberos not supported

Ingestion type (Backup, Dump, Replication, Snapshot)

- MongoOPS Manager Backup Files
- Mongodump
- Replicaset

Encryption (At Rest, TLS/SSL, Encrypted backups)

Supported

Link to documentation

<https://delphix.github.io/mongo-plugin/>

### Microsoft SQL backup ingestion

Data source version and OS version

	Windows 2012	Windows 2012 R2	Windows 2016	Windows 2019	Windows 2022
SQLServer 2012	Y	Y	Y	N	N
SQLServer 2014	Y	Y	Y	N	N
SQLServer 2016	Y	Y	Y	Y	N
SQLServer 2017	Y	Y	Y	Y	Y
SQLServer 2019	N	N	Y	Y	Y
SQLServer 2022	N	N	Y	Y	Y

Size in TB / sizing

No sizing limitation

Frequency of refreshes

No limitation

Source backup policy

dSource sync is managed by customers and can apply backup on staging whenever required.

Use case (PIT provisioning, Dev/Test)

Does not support Point-in-Time Provisioning.

Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

V2P is not supported

Timestamp on snapshot metadata (Affects other products too (HANA, but not Oracle/SQLServer)

This plugin ingests Backups at any time, so the time flow may not go in linear order.

## Architecture options

Failover clusters and availability groups

- Does not support Windows Failover Clusters or Availability Groups for Windows Staging and Target environments.
- Authentication Type (LDAP, Kerberos,)

Ex: LDAP and Kerberos are not supported at this time, but please contact Ranzo Taylor if you have a customer who requires this.

Ingestion type (Backup, Dump, Replication, Snapshot)

Full backups, Differential backups, Log Shipping, Transaction replication

Backup vendor (Commvault, Native, Replication)

All backup vendors are supported

Encryption (At Rest, TLS/SSL, Encrypted Backups)

- Encryption at Rest should work, but has not been tested.
- Encrypted Backups should work, and has not been tested.

Link to documentation

[https://delphix.github.io/mssql\\_plugin\\_doc](https://delphix.github.io/mssql_plugin_doc)

## MySQL Linux

Connector/Delphix engine compatibility

Delphix Engine Version	Connector Version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0

<b>Delphix Engine Version</b>	<b>Connector Version</b>				
6.0.4.0	Y	Y	N	N	N
6.0.5.0	Y	Y	N	N	N
6.0.6.0	Y	Y	N	N	N
6.0.7.0 to 6.0.16.0	N	N	Y	N	N
6.0.16.0 and above	N	N	Y	Y	Y

Supported DBMS version

<b>Supported DBMS Version</b>	<b>Connector version</b>				
	<b>1.0.0</b>	<b>2.0.26</b>	<b>2.1.0</b>	<b>3.0.0</b>	<b>4.0.0</b>
MySQL Community 5.7.x	Y	Y	Y	Y	Y
Percona Server 5.7.x	N	N	N	Y	Y
MySQL Community 8.0.x	N	N	N	N	Y
Percona Server 8.0.x	N	N	N	N	Y

Supported operating system

<b>Supported OS Version</b>	<b>Connector version</b>				
	<b>1.0.0</b>	<b>2.0.26</b>	<b>2.1.0</b>	<b>3.0.0</b>	<b>4.0.0</b>
RHEL 6.9 / 7.x	Y	Y	Y	Y	Y

Size in TB / sizing

No known limitations.

Frequency of refreshes

No known limitations.

Source backup policy

Here note any possible issues of the plugin conflicting with or relying on Source Backup Policy.

Ex: This EDSI uses backup ingestion, and relies on the production backup schedule to determine its snapsync granularity.

Ex: This EDSI uses backup ingestion, but for RDS integration we use a hook and create our own backups.

Use case (PIT Provisioning, Dev/Test)

Here note any possible issues with certain use cases

Ex: Does not support Point-in-Time Provisioning.

Ex: Only useful for migration to the cloud, not appropriate for Dev/Test, Compliance, or AI/ML training.

Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

Here note any Delphix Options which don't work, or which do work but not be readily apparent.

Ex: Supports SDD, API Calls. Does not Support Fancy GUI Icons or GUI PIT Provisioning.

Timestamp on snapshot metadata (Affects other products too (HANA, but not Oracle/SQLServer)

Here note issues/workarounds relating to Timestamps of Snapshot.

Ex: This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

Architecture options

Clustering (Active/Active vs Active/Passive, different Vendors)

Plugin has not been tested & certified with clustered configurations.

Sharding

Partial

	Un-Sharded VDB	Sharded VDB
Un-Sharded Source	Y	N
Sharded Source	N	N

Authentication type (LDAP, Kerberos,)

LDAP and Kerberos are not supported at this time, but please contact Ranzo Taylor if you have a customer who requires this.

Ingestion type

mysqldump works, RAW/mysqlbackup does not

- Manual Backup Ingestion
- Simple Tablespace Backup
- Replication

Backup vendor (Commvault, Native, Replication)

Supports Native Backups & Replication

Encryption (At Rest, TLS/SSL, Encrypted Backups)

- Encryption at Rest has not been tested.
- Encrypted Backups have not been tested.

Link to documentation

[MySQL environments and data sources](#)

Oracle backup ingestion

Data source version and OS version

	<b>RHEL 6.x</b>	<b>RHEL 7.0</b>	<b>Windows</b>
Oracle 9i/10g/11r1	<b>N</b>	<b>N</b>	<b>N</b>
Oracle >= 11gR2	<b>Y</b>	<b>Y</b>	<b>N</b>

Size in TB / sizing

No Restrictions.

Frequency of refreshes

No specific limitations

Source backup policy

No limitations for disk.

For Tape Backup - Autobackup should be enabled.

Use case (PIT Provisioning, Dev/Test)

- Disk - Archivelog need to be made available on target host for Point-in-Time Provisioning.
- Tape - Tape library installed on target and authorized to access tape from target host.
- Support using timestamp.

Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.

Timestamp on snapshot metadata

This plugin ingests Backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

Architecture Options

Full	Y	Y	Y	Y	Y	NA
Partial	Y	Y	Y	Y	Y	NA
PDB	Y	Y	Y	Y	Y	N
Partial PDB	Y	Y	Y	Y	Y	N
Use Existing CDB	NA	NA	NA	N	NA	N
Seed	NA	NA	NA	NA	N	NA

RAC

Manual Addition, Selection of nodes and Checks needed to create successful RAC VDBs.

Ingestion type (Backup, Dump, Replication, Snapshot)

- RMAN database backup

Backup vendor (Oracle RMAN, ZDLRA, DDBOOST, NETBACKUP, Generic Tape Drivers)

- Oracle RMAN
- ZDLRA
- DDBOOST
- NETBACKUP
- Other Tape Vendors not listed above not tested but most probably will work

Link to documentation

<https://delphix.github.io/obi-plugin/> NOT TESTED

SAPIQ

Data source version and OS version

Supported OS Version	SAPIQ 16.0	SAPIQ 16.1
RHEL 7.0	Y	Y

Supported OS Version	SAPIQ 16.0	SAPIQ 16.1
RHEL 7.4	Y	Y
RHEL 7.9	Y	Y
Windows x.x	N	N

Size in TB / sizing

Tested at the customer with 600-800GB ingestion size.

Frequency of refreshes

No limitation

Source backup policy

Customers will manage backup located on the staging host required to create dSource.

Use case (PIT Provisioning, Dev/Test)

Does not support Point-in-Time Provisioning.

Delphix option (SDD, API Calls, GUI Icons, GUI PIT Prov)

- V2P is not supported.
- Password Vault is not supported.
- SDD is not supported.

Timestamp on snapshot metadata

This plugin ingests backups at any time, so the time flow may not go in linear order. Time of Backup is not readily available.

### Architecture options

Supports SAPIQ Simplex Architecture for VDBs.

Architecture	SAPIQ 16.0	SAPIQ 16.1
Simplex	Y	Y
Multiplex	N	N

- IQ Plugin converts multiplex architecture to simplex during VDB provision.
- Ingest SAPIQ source databases which are backed up using SAPIQ built-in backup mechanism.
- Data Ingestion to Delphix Engine will always start with a full DB backup.
- As best practices, it is recommended to keep a similar SAPIQ version in all environments (source, staging and target).

Authentication type (LDAP, Kerberos)KE

- Kerberos not supported.
- LDAP not tested.

Ingestion type (Backup, Dump, Replication, Snapshot)

Full backups for Simplex Architecture Tested.

Backup Vendor

Tested with manual SAPIQ backups.

Encryption (At Rest, TLS/SSL, Encrypted Backups)

- Encryption at Rest has not been tested.
- Encrypted Backups have not been tested.

Link to documentation

<https://delphix.github.io/SAPIQ/>

Cockroach

Data source version and OS version

Supported OS Version	CRDB v21.1.x	CRDB v21.2.x	CRDB v22.1.x	CRDB v22.2.x
RHEL 7.x	Y	Y	Y	Y
RHEL 8.0	Y	Y	Y	Y
Windows	N	N	N	N

Architecture options

Architecture	Disk	Seed	AWS	GCP	Azure
Full	Y	Y	Y	N	N
Incremental	Y	Y	Y	N	N

Engine compatibility matrix

Engine Version	CRDB v1.0.0
6.0.12.0 - 6.0.17.x	Y

Engine Version	CRDB v1.0.0
7.0.0.0	Y
8.0.0.0	Y

PostgreSQL JDBC driver matrix

PostgreSQL Driver Version	Supported
42.3.2	Y
42.3.6	Y
42.4.0	Y

JDBC masking support matrix

Masking Mode	Feature	Availability
In-Place Masking	Multi-Tenant	Available
	Streams/Threads	Available
	Batch Update	Available
	Drop Indexes	Unavailable
	Disable Constraint	Unavailable
	Disable Trigger	Unavailable NA for <a href="#">CockroachDB</a>
	Identity Column Support	Available
On-The-Fly Masking		Unavailable
Profiling	Multi-Tenant	Available
	Streams	Available

- Drop Indexes and Disable Constraint are not supported natively while masking CockroachDB. Use pre/post scripts if you want to use these features.
- CockroachDB supports rowid natively for tables with no primary key defined. It will automatically create a primary key over a hidden, INT-typed column named rowid.
- To create a successful JDBC connection to CockroachDB cluster running in secure mode, please enable the password authentication without TLS using flag `--accept-sql-without-tls` with `cockroach start` command.
- To mask the CockroachDB data source where CDC (change data capture) feature is enabled, disable all the running change-feed jobs using the below command

```
SHOW CHANGEFEED JOBS; PAUSE JOBS (WITH x AS (SHOW CHANGEFEED JOBS)
SELECT * FROM x WHERE status = ('running'));
```

- Resume CDC job once CockroachDB masking is completed

```
RESUME JOBS (WITH x AS (SHOW CHANGEFEED JOBS) SELECT * FROM x WHERE
status = ('paused'));
```

#### Ingestion type

- AWS S3 Backup Ingestion
- Seed Ingestion

#### Limitations

- CockroachDB Ingestion from Azure, GCP, and Disk is not supported.
- CockroachDB Point-in-time restore is not supported.
- Delphix V2P is not supported.
- Delphix Password Vault is not supported.

## Migration and compatibility

This section covers the following topics:

- [Upgrade matrix](#)
- [Supported Oracle DBMS versions and operating systems for source and target environments](#)
- [Supported SAP ASE versions and operating systems](#)
- [Supported SQL server versions, operating systems, and backup software](#)
- [Tested browser and operating systems](#)

## Upgrade matrix

This section lists all the Delphix Engine versions that a user can upgrade to the required or the latest version.

**i Self-service upgrades of the Delphix Engine to version 6.0.x.x from version 5.3.0 or older is not supported.**

Versions 5.3.6.0 - 5.3.9.0 can only be upgraded as far as 6.0.6.1, and can then be upgraded to a newer version.

**Starting with version 6.0.10.0, direct upgrades will only be supported to versions released in the last 12 months, per Delphix policy.**

Version 6.0.4.1 and above can upgrade directly to version 6.0.10.1.

Versions 6.0.0.0 - 6.0.4.0 can only be upgraded as far as 6.0.7.0, and can then be upgraded to 6.0.10.1.

Version	Date released	Can upgrade to	VDB downtime required
> 5.3.5.0	Aug 8th, 2019	Contact Support	Yes
5.3.6.0	Oct 10th, 2019	6.0.0.0 - 6.0.6.1	Yes
5.3.7.0	Dec 9th, 2019	6.0.1.0 - 6.0.6.1	Yes
5.3.7.1	Jan 13th, 2020	6.0.1.0 - 6.0.6.1	Yes
5.3.8.0	Feb 10th, 2020	6.0.1.0 - 6.0.6.1	Yes
5.3.8.1	Feb 26th, 2020	6.0.1.0 - 6.0.6.1	Yes
5.3.9.0	Apr 14th, 2020	6.0.2.0 - 6.0.6.1	Yes
6.0.0.*	Jan 22nd, 2020	6.0.0.* - 6.0.7.*	Optional
6.0.1.*	Mar 19th, 2020	6.0.1.* - 6.0.7.*	Optional
6.0.2.*	May 7th, 2020	6.0.2.* - 6.0.7.*	Optional
6.0.3.*	Jul 31st, 2020	6.0.3.* - 6.0.7.*	Optional
6.0.4.*	Sep 10th, 2020	6.0.4.* - 6.0.7.*	Optional
6.0.5.*	Nov 5th, 2020	6.0.5.* - 6.0.11.*	Optional

Version	Date released	Can upgrade to	VDB downtime required
6.0.6.*	Jan 21st, 2021	6.0.6.* - 6.0.12.*	Optional
6.0.7.*	Mar 15th, 2021	6.0.7.* - 6.0.13.*	Optional
6.0.8.*	May 13th, 2021	6.0.8.* - 6.0.14.*	Optional
6.0.9.*	Jul 13th, 2021	6.0.9.* - 6.0.15.*	Optional
6.0.10.*	Sep 9th, 2021	6.0.10.* - 6.0.16.*	Optional
6.0.11.*	Nov 11th, 2021	6.0.11.* - 6.0.17.*	Optional
6.0.12.*	Jan 14th, 2022	6.0.12.* - 7.0.0.*	Optional
6.0.13.*	Mar 10th, 2022	6.0.13.* - 9.0.0.*	Optional
6.0.14.*	May 20th, 2022	6.0.14.* - 10.0.0.*	Optional
6.0.15.*	Jul 7th, 2022	6.0.15.* - 10.0.0.*	Optional
6.0.16.*	Sep 8th, 2022	6.0.16.* - 10.0.0.*	Optional
6.0.17.*	Nov 15th, 2022	6.0.17.* - 10.0.0.*	Optional
7.0.0.*	Jan 12th, 2023	7.0.0.* - 10.0.0.*	Optional
8.0.0.*	Feb 13th, 2023	8.0.0.* - 10.0.0.*	Optional
9.0.0.*	Mar 13th, 2023	9.0.0.* - 10.0.0.*	Optional
10.0.0.*	Apr 13th, 2023	10.0.0.*	Optional

The \* in the above table represents patch releases. When upgrading from X.Y.Z.x to X.Y.Z.x, the target version must be greater than the source version. Please refer to the [How to Upgrade](#) article for steps, or check with Delphix Support to perform the upgrade.

1. VDB Downtime is caused by a reboot of the Delphix Engine when DelphixOS is modified by an upgrade.
2. VDB Downtime may be optional for an upgrade when a release contains DelphixOS changes that are also optional.

## Supported Oracle DBMS versions and operating systems for source and target environments

### Source and Target OS and DBMS Compatibility

- Source and Target must have the same major Oracle version and Edition (Enterprise/Standard). It is recommended to also have the same minor versions and patches.
  - If the minor version (specified with the second digit with Oracle version 18+, or the dated patch level with Oracle version 12.2) or patches differ between the source and target, then a plug-in violation will be received when opening the vPDB on the target, and will need to run datapatch manually or via a hook to resolve it.
- Source and Target operating systems must be compatible. E.g., AIX -> AIX, Solaris SPARC -> Solaris SPARC, x86\_64 Linux -> x86\_64 Linux.
- In addition, x86\_64 Solaris -> x86\_64 Linux and x86\_64 Linux -> x86\_64 Solaris is supported.

### Disclaimers and support notes

Delphix Support Policies specifically list **major** and **minor** release coverage. If a minor release is listed as covered, all patch releases under that minor release are certified. Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL), 64-bit OS support only.

The Oracle version in the support matrix applies to both Oracle DB and Oracle Grid. Delphix supports the same set of features and functionality for supported non-multitenant database versions. Currently, Delphix does not support the Oracle 12c feature of THREADED\_EXECUTION being set to TRUE, because this disables OS authentication.

Summary of Delphix features that are unsupported for the Oracle12c and higher Multi-tenant configuration:

- Existing Virtual Container Database (vCDB) as target for provisioning an additional vPDB
- Customize VDB settings/initialization parameters. Includes the following:
  - Customize init.ora database parameter during provisioning
  - Config templates
  - Online redo log size
  - Number of RAC VDB instances
  - Online redo log groups
  - Archive log mode
  - Setting new DBID
  - Customize local listeners
- Virtual to Physical (V2P) Support
- Resumable initial SnapSync
- Validated Sync
- Source continuity for dSource upgraded from Oracle 12c non-multitenant to multitenant database
- Cross-platform provisioning (XPP) to the virtual database
- Oracle LiveSources

Delphix supports systems that are part of an Exadata or Exadata Cloud-at-Customer (ExaCC) cluster, provided that the operating system and DBMS version are in the supported list. Oracle Exadata, Exadata Cloud, and Exadata Cloud-at-Customer (ExaCC) offer several features that are reliant on the underlying Exadata storage. Delphix supports creating dSources from Exadata source clusters and provisioning VDBs and vPDBs to Exadata target clusters.

The following Exadata-only features will not be available in child VDBs running in Delphix storage:

- Smart Scan - allows SQL processing to be offloaded to Exadata storage cells. Queries that leverage Smart Scan will execute successfully in VDBs but query performance may be impacted.
- Smart Flash Cache - allows frequently used data blocks to be stored in the flash cache of Exadata storage cells to allow for faster access. Queries against objects that are normally cached in Smart Flash Cache will execute successfully in VDBs but query performance may be impacted. As the virtualization engine uses memory to cache frequently used data blocks, allocating extra memory to the engine may help to mitigate this performance impact.
- Hybrid Columnar Compression (HCC) - compresses data and stores it in a columnar format, allowing Exadata storage cells to deliver faster query performance while also saving on storage. Columns compressed using HCC cannot be used by queries executed in VDBs. Affected columns can be decompressed though care should be taken to evaluate the impact of doing so on VDB refresh times and Delphix storage usage. In Delphix VDBs, queries against partitions or tables using HCC will fail with the following error "ORA-64307: Exadata Hybrid Columnar Compression is not supported for tablespaces on this storage type".

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

### Oracle database editions

Delphix supports the following Oracle database editions:

- Enterprise
- Standard

### Red Hat Enterprise Linux (RHEL)

 Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please refer to [KBA 5622](#) for the required steps.

## Solaris SPARC

Supported OS version	12cR1	12cR2	18c	19c	21c
	Supported DBMS version				
Solaris 10 U9 <sup>1</sup>	NA	NA	NA	NA	NA
Solaris 10 U10 <sup>1</sup>	Y	NA	NA	NA	NA

Supported OS version	12cR1	12cR2	18c	19c	21c
Supported DBMS version					
Solaris 10 U11	Y	N	Y	NA	NA
Solaris 11	Y	NA	NA	NA	NA
Solaris 11 U1	Y	NA	NA	NA	NA
Solaris 11 U2	Y	Y	Y	NA	NA
Solaris 11 U3	Y	Y	Y	Y	NA
Solaris 11 U4	N	Y	Y	Y	NA

 <sup>1</sup> - Solaris 10 U9 and U10 require libc.so.1 version 1.22.7 or newer. This version of libc.so.1 can be found in Solaris 10 SPARC kernel patch 144500, or a newer kernel patch.

## Solaris x86

Supported OS version	12cR1	12cR2	18c	19c	21c
Supported DBMS version					
Solaris 10 U9 <sup>1</sup>	NA	NA	NA	NA	NA
Solaris 10 U10 <sup>1</sup>	Y	NA	NA	NA	NA
Solaris 10 U11	Y	NA	Y	NA	NA
Solaris 11	Y	NA	NA	NA	NA
Solaris 11 U1	Y	NA	NA	NA	NA
Solaris 11 U2	Y	Y	Y	NA	NA
Solaris 11 U3	Y	Y	Y	Y	NA
Solaris 11 U4	N	Y	Y	Y	NA

 **1** - Solaris 10 U9 and U10 require libc.so.1 version 1.22.7 or newer. This version of libc.so.1 can be found in Solaris 10 X86 kernel patch 144501, or a newer kernel patch.

### Hewlett Packard Unix (HP-UX)

Supported OS version	12cR1	12cR2	18c	19c	21c
	<b>Supported DBMS Version</b>				
HP-UX 11.31	Y	Y	N	N	NA

### Advanced Interactive Executive (AIX)

Supported OS version	12cR1	12cR2	18c	19c	21c
	<b>Supported DBMS version</b>				
AIX 6.1	Y	N	N	NA	NA
AIX 7.1	Y	Y	Y	Y	NA
AIX 7.2	Y	Y	Y	Y	NA

Delphix supports all x86/x64 CPU environments for source and target.

 **Required HP-UX patch for Target Servers**  
 PHNE\_37851 - resolves a known bug in HP-UX NFS client prior to HP-UX 11.31.

## Supported SAP ASE versions and operating systems

This topic describes supported operating systems and database versions for SAP ASE.

### Supported DBMS versions

- ASE 15.5
- ASE 15.7
- ASE 16.0

### Supported operating systems

#### **i** Source and Target OS and DBMS compatibility

The source and target must be running the same DBMS/Operating System combination, (*although users can run different patch/sp levels*) in order to successfully provision a VDB to the target. For example, if the source is running SAP ASE 16, the target can be running ASE 16SP1. However, for ASE 15.7 the versions of the source and target should both be in the 15.7 SP100 to 15.7 SP140 or 15.7 ESD#1 to 15.7 SP64 ranges. There can be no mixing of versions between these two ranges. If the target is used as a staging server, the same rule applies (prior to Delphix 5.2.5.0, the staging server had to match the source server's version down to the SP level). The Operating System platform must be the same between the source and target, even when the operating system version may differ. For example, if the source is running Red Hat Enterprise Linux 6.2 x86\_64 then the target could be running Red Hat Enterprise Linux 6.4 x86\_64, but not Solaris 10 SPARC.

ASE itself may or may not allow the **MOUNT** command to work between versions. Be sure to check that the **UNMOUNT** and **MOUNT** commands work between your desired ASE versions.

So for example, if we upgraded the ASE staging instance to ASE 15.7 SP140 but we keep the ASE instance hosting the VDBs at ASE 15.7 SP135, we would want to make sure that we can **UNMOUNT** a database from ASE 15.7 SP140 and then **MOUNT** it on ASE 15.7 SP135:

```
isql -Usa -Psybase -SASE157SP140 1> UNMOUNT DATABASE testdb to "/tmp/manifest" 2> GO isql -Usa -Psybase -SASE157SP135 1> MOUNT DATABASE testdb from "/tmp/manifest" 2> go Msg 14580, Level 16, State 1: Server 'ASE157SP135', Line 1: You cannot mount the database(s) because at least one database contains functionality that is available only on the server on which it originated.
```

In the above example, ASE would not allow the database "testdb" to be mounted on the older release of ASE.

Delphix supports all 64-bit OS environments for source and target.

#### **i** Required HP-UX patch for target servers

PHNE\_37851 - resolves a known bug in HP-UX NFS client prior to HP-UX 11.31.

### Support matrix

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- 64-bit OS support only

**Key:**

Color	Supported?

## Supported SQL server versions, operating systems, and backup software

 Delphix only supports 64-bit operating systems.

### Windows server

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Delphix only supports 64-bit operating systems.

**Key:**

Color	Supported?
Y	Yes
NA	Not Applicable

### Windows server

Supported OS version	SQL Server 2012	SQL Server 2014	SQL Server 2016	SQL Server 2017	SQL Server 2019
	<b>Supported DBMS version</b>				
Windows Server 2012	Y	Y	Y	Y	NA
Windows Server 2012 R2	Y	Y	Y	Y	NA
Windows Server 2016	Y	Y	Y	Y	Y
Windows Server 2019	NA	NA	Y	Y	Y
Windows Server 2022	NA	NA	NA	Y	Y

## Tested browser and operating systems

This topic describes the Web browsers and operating systems that have been tested for use with the Delphix Management application.

The following table lists the supported browsers and operating systems.

<b>OS</b>	<b>Browsers</b>
Windows 11	Microsoft Edge, Firefox, Chrome
Windows 10	Microsoft Edge, Firefox, Chrome
Windows 8.1	Microsoft Edge, Firefox, Chrome
Windows 7	Microsoft Edge, Firefox, Chrome
Mac OS X	Microsoft Edge, Firefox, Chrome

 Delphix supports the latest version of Microsoft Edge, Firefox, and Chrome as well as the immediate prior version.

## Fixed issues

**⚠** Multiple Device Removal in the Delphix Engine 6.0.12.0 and higher version introduces a breaking kernel module change that requires a reboot to load the new module. Therefore, a deferred reboot engine upgrade operation will be unable to remove devices until a reboot is performed.

## Release 10.0.0.0 changes

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-85019 (only applicable to initial deployments)	Fixed a bug that causes the management service to fail startup upon initial VM deployment in the cloud, if the DHCP domain name of the VM ends with a period (.).
DLPX-85109 (only applicable to initial deployments)	Fixed a bug that causes the management service to fail startup upon initial VM deployment in the cloud, if the DHCP domain name of the VM contains bad characters (does not belong to [a-zA-Z0-9.-]).
DLPX-84985	Fixed a deadlock which caused iSCSI connections to fail on Windows hosts.
DLPX-84995	Fixed an issue where NFS could cause excessive CPU usage when open files from NFSv4 mounts exceeded 16,384.
DLPX-62215	Fixed a nuance in the CAPACITY_RECLAMATION job.

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-51276	Configuration discovery script fixed to handle Windows host timezone more smoothly.
DLPX-53420	Improved error message for failure in deleting CDB sources with no associated PDBs, but with timeflow dependencies from migrated vPDBs.
DLPX-59162	Fixed failure in connecting to a Compliance engine while running a compliance job as a post-provision hook operation for RAC VDBs.

Bug number	Description
DLPX-61781	Fixed authentication failures past the first node while adding Kerberized RAC environments.
DLPX-66944	Fixed logsync failures caused by commands exceeding shell limit of 1,024 characters.
DLPX-68327	Certificates in the Truststore are considered for making connections to SMTP servers.
DLPX-74134	Fixed an issue where Oracle provisioning/refresh/rewind operations may fail with error "ORA-01169: DATAFILE number 1 not found. Must be present."
DLPX-76200	To handle unusually demanding workloads, the maximum heap size of the management application can now be increased by system administrators via the maxHeapSizeGb property of the CLI at /system.
DLPX-78673	Fixed an issue related to a message being ignored during the mount check when provisioning virtual databases. The message is not thrown because the provision completes successfully, but it could still be seen in the logs.
DLPX-80925	Fixed an issue of a raised fault due to inconsistent snapshot creation time, due to manual change of Delphix engine time.
DLPX-81874	Fixed an issue that occurred during the discovery of a cluster when adding or refreshing a Windows FCI environment with multiple NICs. The issue involved the use of the IP address of hosts that were already added.
DLPX-81982	The Delphix Fluentd logs do not automatically rotate when exceeding their expected maximum size of 100MB.
DLPX-82169	Fixed an issue where provisioning an Oracle TDE-enabled vPDB into a linked CDB with a different patch level than the source CDB will fail leaving the vPDB in a broken state.

Bug number	Description
DLPX-84108	The validation of RSS on the target host will now only occur when the customer uses an IP address for an environment. This update removes the detection of the RSS property on interfaces that are not relevant.
DLPX-84422	You can now use a single script to copy all transaction log backup files, regardless of whether they were created using native backup or Litespeed backup.
DLPX-84647	The syslog pattern is now fully configurable and can be changed to conform to RFC 5424.
DLPX-84655	A false warning message that listener registration was not successful is posted when enabling a VDB or a vCDB, users can ignore this message.
DLPX-84679	Unable to add Oracle Staging push PDB if the Staging Environment has more than one repository.
DLPX-84686	To address the issue of multiple IP addresses, the validation of RSS on the target host will now only occur when the user uses an IP address for an environment. This update removes the need to find the IP address in the code.
DLPX-84898	Fixed clean-up job failure for V2ASM of a RAC VDB when one of the nodes's DB instance is shutdown.
DLPX-84929	Improved initial load time of datasets page.
DLPX-84944	The Delphix Continuous Data Engine now considers truststore certificates for more connections, including secure connections to proxy and SMTP hosts.
DLPX-85053	Powershell scripts code enhancement.
DLPX-85095	Fixed an issue which caused the vPDB Refresh operation to fail due to vPDB unplug operation timing out in 30 mins.

## Release 9.0.0.1 changes

Bug number	Description
DLPX-85176	Fixed a bug that can bring down VDBs using NFSv3.

## Release 9.0.0.0 haanges

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-85019	Fixed handling of domain names with a terminal period (.) in Terminal.
DLPX-68852	Fixed a bug in out of memory situations that could result in service interruptions.

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-41505	Posted a job warning message when listeners are not registered successfully as part of an Oracle VDB/vPDB provision job.
DLPX-46210	Fixes <code>fault.policy.log.retention.old.snapshot</code> , which is not raised against a PDB snapshot instead of CDB snapshots.
DLPX-57047	For MSSQL, 'Delphix Copy Only Full Backup' is now excluded when synchronizing to most recent backup files.
DLPX-58762	Provides a better action message in Oracle nologging-related faults.
DLPX-65557	Retention no longer removes the previous timeflow until the current timeflow is successful.
DLPX-68852	Fixed an issue that could cause upgrade failures.
DLPX-69790	Fixed an issue where API login with an ambiguous user name returns an incorrect action.
DLPX-70090	The correct exception is now showing when hostname is not resolvable during Environment Validation.

Bug number	Description
DLPX-79792	If there are any DB snapshots associated with the VDB during creation of a Self-Service bookmark, there will be a message to drop all associated snapshots with the VDB and try again.
DLPX-81260	The CLI error message that appears due to 'invalid primaryAddress value', has been updated to provide better insight on a resolution.
DLPX-83702	Fixed an issue where the environment discovery path was not checked to ensure it is a valid unix path.
DLPX-83905	Fixed an issue causing <code>HOST_REFRESH</code> failures when toolkit is on a shared filesystem, with an Oracle RAC configuration.
DLPX-84068	For MSSQL, warning fault raised in case there is a failure while querying instance port.
DLPX-84284	After upgrades, NFSv3 services are automatically disabled if they are no longer required.
DLPX-84339	Fault raised due to inconsistent snapshots creation time, due to manual change of Delphix Engine time.
DLPX-84351	SMTP Test now has a check in the UI to let the user know if the password was unaltered. Save now has a check to not send the password if it was unaltered.
DLPX-84528	Datasets Search bar will now work for the staging push dSource as well.
DLPX-84589	Increased size of ssh key fields to allow for larger key, for environment users.
DLPX-85081	Fixed an NFS issue that could cause NFSv3 services to be disabled even though there were active v3 mounts after an upgrade.

## Release 8.0.0.0 changes

### Fixes that take effect after an optional reboot (Activated after option Reboot)

Bug number	Description
DLPX-83859	Fixed a rare deadlock in the kernel that can cause a Delphix Engine to become unresponsive to all management operations.

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-43174	Fixed an issue where Oracle VDB provision job will fail if the "Open database after provision" flag is set to false.
DLPX-48083	Removed the CLI ability to set default user as it was not needed and prevents deletion.
DLPX-52904	After initial server setup, Default Snapshot/Snapsync policies are always in "US/Pacific", regardless of the timezone selected during initial Engine Setup. An admin has to manually change the time zone.
DLPX-53209	Improved error messaging during toolkit preparation (discovery) when there are host problems.
DLPX-59248	Added a fix to throw a critical alert on the last failed attempt to collect the archive log.
DLPX-59308	Added a timeout in the drop database PowerShell script.
DLPX-59689	Fixed an issue where the environment discovery could hang indefinitely when UserLAnd commands hang (i.e. lsnrctl status, ps, etc.).
DLPX-61734	Fixed an issue where the user was unable to provision an Oracle VDB when there is a dollar sign in the Tablespace name.
DLPX-62857	Permits listing users with only the "domainUserType" parameter.
DLPX-64413	Fixed an issue where provisions/refreshes of Oracle VDBs could fail when an obsolete parameter is specified in the VDB config template.
DLPX-72691	Fixed an issue where multiple snapshots were reporting the same time in the Delphix Continuous Data GUI for standby databases.
DLPX-72740	Increased users' pubkey support from 10 to 1000.
DLPX-75521	The correct error message will now be displayed in case of a provisioning failure due to waiting for the 'DB STARTUP' process timeout.
DLPX-75605	Fixed an issue where the Security Banner was not displayed after SSH login.
DLPX-77438	Added a fix to disable UNDO operation if any children for the timeflow are present.

Bug number	Description
DLPX-77792	Fixed a misleading "toolkit inaccessible" error if password expired.
DLPX-78702	Fixed an issue where users with the SYSTEM permission are able to disable any source.
DLPX-78741	For MSSQL, raised a critical fault in case the Validated Sync interval increases to 16 minutes or more.
DLPX-79136	Fixed an issue where canceling an Oracle VDB preprovision job or a vPDB (into linked CDB) provision job leaves the auxiliary database mounted on the target host.
DLPX-79919	Fixed an issue where the Delphix Continuous Data Engine allowed an environment with a duplicate "crs_database_name" to be added.
DLPX-81182	Improved the error message for when the system is out of space.
DLPX-81425	The UI will now show the running jobs up to 60 days old.
DLPX-81497	Added a fix to improve "keystore.merge.required" fault for an Oracle TDE-enabled vPDB.
DLPX-82152	Fixed an issue where navigating resolved faults was slow.
DLPX-83575	The port in the connection string for a vPDB in a Linked CDB may be shown incorrectly when it is registered to a non-default listener.
DLPX-83635	Fixed an issue where exporting the TDE encryption keys failed when the keystores root is on ACFS and referenced via a symlink.
DLPX-83788	Suggested action in "exception.ccc.authenticate.failed" no longer references Delphix Connector.
DLPX-83823	The issue where a Oracle PDB dSource snapshot is marked as not provisionable after detaching and re-attaching the PDB to a different CDB using force flag is now resolved
DLPX-83904	Fixed an issue where a provision of an Oracle vPDB may fail during recovery if there are many datafiles that are renamed under a single ORA-01244 error.
DLPX-83954	Package details are no longer revealed during HTTP redirection.
DLPX-83977	Fixed an issue causing inability to add a hook, due to "Duplicate key" error.

Bug number	Description
DLPX-84103	Persisting total "database_transaction_log_bytes_used" while taking a snapshot, for debugging purposes.
DLPX-84151	The Replication Page performance has been optimized by making network calls efficiently.
DLPX-84255	In a Single Engine Continuous Vault product, adding a new Sybase dSource to a locked group may result in the background environment monitoring process to stop working.
DLPX-84324	Fixed an issue where NFS mounts on a Solaris target could fail after a deferred upgrade.
DLPX-84495	Fixed an issue that causes upgrades from versions < 6.0.17.0 to any version between 6.0.17.0 and 7.0.0.0 on a replication target engine which may fail due to the management services being down, requiring a support call.

## Release 7.0.0.0 changes

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-83579	Fixed handling of domain names with a terminal period (.) in Terminal.
DLPX-83611	Fixed a race condition between storage device link creation and the storage pool import process.
DLPX-83701	Added additional diagnosability tracepoints to the kernel unmount code.
DLPX-83697	Fixed a hang in the iSCSI initiator.
DLPX-83675	Fixed an issue that was causing stale entries to be created in a system file.
DLPX-83684	Fixed a crash in the zcache_probe command during upgrades.
DLPX-83916	Fixed cases when zcachedb was opening devices for writing when it should be read-only access.

## Fixes that take effect after an optional reboot (Activated after option Reboot)

Bug number	Description
DLPX-80130	Fixed an issue which may cause the Delphix Engine to hang when doing storage migration.
DLPX-83395	Fixed an issue when storage device removal consumes an unexpected high amount of memory upon its completion.
DLPX-83697	Fixed a hang in the iSCSI initiator.

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-66792	Fixed a misleading "toolkit inaccessible" error on VDB Stop/Refresh if password expired.
DLPX-68053	Fixed an issue causing phone home redaction fails when JSON contains management stack errors.
DLPX-71907	Fixed an issue where C drive label gets over-written during mount script execution.
DLPX-74604	For MSSQL, provided a fix to raise warnings in case CommVault restore fails.
DLPX-75278	Fixed display data in Datasets Performance page table.
DLPX-75488	Listeners and Instances for SQL Server AG (Availability Group) will now be shown on the User Interface correctly.
DLPX-77214	Fixed an invalid version status transition when upgrade is cancelled.
DLPX-78014	Automatically disable NFSv3 services when they are no longer required.
DLPX-78506	Fixed dSource Database Authentication issue. Now the user is able to edit the credentials of the dSource DB, where authentication is configured using "Domain User with HashiCorp Vault Credentials".
DLPX-80300	Added more error information for Environment discovery failure when iSCSI target port is blocked on network.

Bug number	Description
DLPX-80473	Fixed an issue where the vPDB unplug operation timed out during disable operation.
DLPX-80512	Fixed pagination on Snapshots tab of Storage Capacity page. Now the user will be able to see all the snapshots using the pagination control at the bottom of the page.
DLPX-81238	DFE caused by policy schedule with a non-recurring quartz cron string.
DLPX-81750	Added a more descriptive message while handling the condition where VDB is renamed outside.
DLPX-81794	For MSSQL, raised a warning fault during environment monitoring in case dlpxrunas is removed. Also, provided fix to propagate the cause of host unavailability while environment refresh.
DLPX-82288	It is now permissible to remove devices after a deferred upgrade from before 6.0.12.0 (multi-device removal support added) to 7.0.0.0 or after.
DLPX-82316	The issue with the failure of the Oracle vPDB provisioning from a standby source and datafile added in the recovery stream is now resolved.
DLPX-82882	Fixed Script: Replacing Self-signed Certificates, on the Delphix Connector.
DLPX-83002	Cron expression handling has been fixed as per quartz cron expressions.
DLPX-83153	Fixed the issue where an invalid fault "fault.oracle.db.connection.failed" was raised during VDB refresh.
DLPX-83372	Profiling script code enhanced.
DLPX-83422	Fixed an issue where Oracle move-to-asm script fails due to missing initialization parameter file init.ora in ` \$ORACLE_BASE_CONFIG/dbs `.
DLPX-83434	Upgrade Spring framework to 5.3.20.
DLPX-83564	Users can now perform V2P of dSource and VDB snapshot to root of a Windows drive.
DLPX-83608	Users can now V2P an MSSQL dSource or VDB snapshot to a Mounted volume on a Windows path.

Bug number	Description
DLPX-83622	Upgrade verify will fail from coming from 6.0.15.0 if a Fluentd plugin other than splunkHec is configured. Support help will be needed to upgrade.
DLPX-83706	Fixed network connectivity issues in cases where the MAC address changes.
DLPX-83783	Implemented a fix to prevent invalid transition after a deferred upgrade.
DLPX-83787	Fixed an edge case issue that could cause an engine to be rebooted after a device has been removed from the storage pool.
DLPX-83789	MountLunData.ps1 script code enhanced.
DLPX-83819	Fixed an issue causing script failure output duplication in debug logs.
DLPX-83824	Fixed an issue where datasets would intermittently going inactive with critical faults.
DLPX-83828	While editing an Environment User, the Password field will be empty by default in order to get the correct password from the end user.
DLPX-84073	Fixed an issue where existing TDE-configured vPDBs would fail to enable after upgrading the Delphix Engine from 6.0.14.0 to a later Delphix Engine version.

## Release 6.0.17.0 changes

### Security Fixes

Bug number	Introduced	Description	Security Bulletin
DLPX-83043	5.2.0.0	Weak DH 1024 bit exchange key detected by security scanner for the Delphix connector.	TB099

## Fixes that take effect after an optional reboot

Bug number	Description
DLPX-75209	Fixed an issue that could cause an AWS EC2 Delphix Engine to be left with no network configuration following a change of instance type.
DLPX-80122	Fixed bug that caused disks with write errors in their history to have degraded performance (activated after optional reboot).
DLPX-81081	Fixed bug that would sometimes cause VMs with a lot of MSSQL VDBs to report issues on reboots (activated after optional reboot).
DLPX-81701	Fixed bug that would sometimes cause OS panics when issuing a reboot (activated after optional reboot).
DLPX-82405	Fixed an issue where the NFS server could fail when restarted (activated after optional reboot).

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-46621	The issue with adding concurrent environment that resulted in <code>exception.executor.object.exists</code> exception is now resolved.
DLPX-56976	The Delphix engine now returns a descriptive error message if Oracle SnapSync or environment monitor fails to connect to the database in the scenario where the value of <code>ORACLE_HOME</code> or <code>ORACLE_BASE</code> is set incorrectly in <code>orabasetab</code> file.
DLPX-57078	The issue that occurred during Oracle provisioning where if a job is canceled during recovery steps, provisioning will continue until the end of recovery before the job is actually cancelled is now resolved.

Bug number	Description
DLPX-57934	The issue where large text objects inserted into MDS caused errors and potentially OutOfMemory is now resolved.
DLPX-59179	Warning fault will no longer be raised when linking is done to a source host running Enterprise Edition SQL Server and a staging host is running Standard Edition SQL Server.
DLPX-60981	Fixed issue that prevented customers from reusing disks from old engines to new ones.
DLPX-63889	For SAP ASE, pre and post validated sync scripts have been removed. Any existing hooks are converted to pre-hooks list and post-hooks list, respectively.
DLPX-64169	For MSSQL, provided a fix to handle registry exceptions for source environment.
DLPX-70817	Fixed issue that prevented customers from using a disk after running the I/O report card on it.
DLPX-71064	Updated the error action for Lua and Platform plugin upgrade validations.
DLPX-73533	Added fix to prevent multiple connector operations' testing for the presence of the same SCRIPT directory.
DLPX-78787	For MSSQL, added a retryer to get the FQDN of the host.
DLPX-81043	Added additional guidance while doing Replace Certificate on the Upload Certificate step.
DLPX-81532	Standby files for MSSQL V2P operations are now created in the DATA/db folder.
DLPX-81842	Fixed an issue of Arithmetic overflow while fetching database size.

Bug number	Description
DLPX-82050	Fixed an issue in the intersection of extended replica retention, chained replication, and an entire timeflow getting deleted on the source engine.
DLPX-82145	Fixed an issue where TDE-enabled RAC vPDB provisions may fail with “ORA-28374: typed master key not found in wallet” when activating the key in the target CDB.
DLPX-82262	Disabled Apollo client DevTools to avoid vulnerabilities.
DLPX-82371	Delphix Engine improvements.
DLPX-82433	Fixed an issue where provisioning or refresh of TDE-enabled vPDBs could fail with an internal error if the <code>tdeKeystoresRootPath</code> contains any special characters.
DLPX-82514	Password field is now initially empty so that users can enter password.
DLPX-82527	Delphix Engine improvements.
DLPX-82686	Rollback during upgrade now works on Cloud Engines.
DLPX-82859	Fixed an issue where API clients that close their connections early while getting a list of snapshots could cause an internal resource leak that could make the application unresponsive if a replication job is initiated afterward.
DLPX-82908	Managed Source Data UI page now correctly displays the Type of Data for AppData sources.
DLPX-82972	Provided the capability to override default root squash behavior for mounted filesystem of unstructured files via Tunable: <code>LUA_VFILE_TOOLKIT_ROOT_SQUASH_DISABLE</code> .

<b>Bug number</b>	<b>Description</b>
DLPX-83103	Fixed an issue of environment refresh failure for Windows host after upgrade to 6.0.16.0 occurred due to iSCSI related registry parameters' monitoring.
DLPX-83105	Fixed an issue following upgrades where SSO entityID changes without user intervention.
DLPX-83148	Fixes environment refresh of an Oracle Live Source environment failure reporting an internal error.
DLPX-83149	From Windows Connector side, while handshaking, stop using the cipher suites which uses Diffie-Hellman key exchange with keys less than 2,048 bits in size.
DLPX-83206	Improved the error message that is displayed when RMAN/sqlplus connection to an Oracle virtual database fails.
DLPX-83359	Delphix Engine improvements.
DLPX-83504	Delphix Engine improvements.
DLPX-83595	The default behavior for VDBs is altered, to disable DBCC CHECKTABLE commands for datafile accessibility.
<b>Bug number</b>	<b>Description</b>
DLPX-67753	Fixed an issue causing redirect responses to reveal server type and version when HTTP redirection is enabled.
DLPX-72068	Improved the way volumes are fetched while working on mounts.
DLPX-74396	Fixed an issue that occurred when manually adding a database to an environment which has the same unique name as a database in another environment managed by the same Delphix engine. Previously, Delphix reported an incorrect environment containing the same unique name.

Bug number	Description
DLPX-80172	Updated the Self-Service refresh warning message.
DLPX-80271	changeArchivelogMode now has an associated job event.
DLPX-80387	Fixed an issue where Oracle move-to-asm script would fail while dropping temp due to tempfiles being in use and unable to be dropped after the database was started.
DLPX-81184	For S3 object store, the "Base URL" input is renamed to "endpoint". The "region" input is now a dropdown for the user to select from a list of standard regions. The endpoint corresponding to that region will now be auto-populated.
DLPX-81692	Fixed an issue where Direct NFS was not being detected for Oracle 21.
DLPX-81996	Fixed an issue where an environment refresh after upgrade did not remove outdated/obsoleted toolkit components in 6.0.014.0 and 6.0.15.0.
DLPX-82075	Fixed an issue that prevented the creation of a network route whose gateway is reachable through multiple interfaces.
DLPX-82112	Added checks to prevent using NFSv4 with Direct NFS for some Oracle 19 versions that don't support v4 due to an Oracle bug.
DLPX-82236	Fixed an issue where Speculative Logging was being called out of context and could lead to unbounded consumption of rpool.
DLPX-82308	Fixed an issue where the provision/refresh of an Oracle Key Vault vPDB fails with, "ORA-28365: wallet is not open".
DLPX-82329	Action-based alerts now include the success or failure state of the action, including the reason in case of failure.

Bug number	Description
DLPX-82334	Enabled the creation of on-link network routes; routes whose destination are directly reachable without a gateway.
DLPX-82381	Improved Replication performance on engines with a lot of objects.
DLPX-82392	Fixed an issue where after editing credential environment variables, the create/provision VDB wizard would fail because the environment variables were missing the password field in the payload. The required password field has now been added.

## Release 6.0.15.0 changes

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-80760	Increased the inotify limit to address a defect during upgrade.

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-68240	Fixed an issue where LogSync for an Oracle RAC standby does not set max number of backup tasks correctly.
DLPX-73375	Added granularity in restore job events to mark various phases of Restore Backup process. Added events in Restore Backup job to provide information at the start of the Redo phase of a restore command.
DLPX-75677	Fixed an issue causing auto population of the encryption key when no input is given.
DLPX-78913	Fixed a minor typing issue when deleting a MSSQL database.

Bug number	Description
DLPX-79228	Fixed a VDB Start Fault after a VDB start job is successful.
DLPX-79528	Made improvements in environment monitoring to return the NO_DELPHIX_DATABASE status for Staging Push dSources when they are not managed by Delphix, and avoids monitoring other attributes for such databases.
DLPX-79596	Made a change in the enable flow for Staging Push dSources to always make an attempt at unmounting the DATA storage before dropping the staging database.
DLPX-79780	Mount with local_lock=all on Linux, when mounting VDBs with NFSv3.
DLPX-79999	Use the offset in the time_zone column of msdb.dbo.backupset to convert the timestamp correctly for a backup from a source, and then continue using the staging host timezone to display the time of a snapshot on the UI.
DLPX-80206	Updated MD5 checksums for Oracle 12.1.0.2.0 OJDBC jars.
DLPX-80254	Fixed an issue where Oracle JDBC jar checksum checks are being reported as false positives despite underlying database connection issues.
DLPX-80406	The Spring framework has been updated due to the Spring4Shell vulnerability.
DLPX-80487	Fixed an issue where the Delphix UI would sometimes not render, showing waiting for response.
DLPX-80494	Added an action item to check for support Host and Server Type combination while adding MSSQL environments.
DLPX-80619	This change will introduce the ability to add sporadic failures via tunable: ADDITIONAL_SPORADIC_FAILURES.

Bug number	Description
DLPX-80909	Cross-Site Scripting (Reflected) in /resources/json/delphix/session.
DLPX-81048	Removed the requirement for Linux kernel recover-lost-locks setting when using NFSv4 with Oracle dNFS.
DLPX-81090	Can now enable/disable SNMPv3 vs. v1/v2.
DLPX-81100	Updated the command for checking database files accessibility while fetching the VDBs status with a lighter and less intrusive command, to get relief from VDBs being stopped randomly.
DLPX-81242	Fixed an issue preventing the upgrade of a replication Continuous Vault source with automatic replication.
DLPX-81308	Fixed an issue causing Appdata SnapSync to crash with NullPointerException when a virtual database is not successfully refreshed or rolledback.
DLPX-81358	Fixed the unnecessary alerts of timezone discovery failure that users were facing randomly for the cluster environments.
DLPX-81502	Improved performance of the Replication page.
DLPX-81696	Users should now be able to enable the feature flag AZURE_DATA_BANK.
DLPX-81710	Fixed an issue where an engine could not be setup when objectStorage is enabled.

## Release 6.0.14.0 changes

### Security Fixes

Bug number	Bug Introduced in	Description	Security bulletin
DLPX-81059	5.2.2.0	Arbitrary Code Execution may be performed when configuring masking environments	<a href="#">TB098</a>

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-38908	Oracle LogSync should automatically resolve faults for transient issues
DLPX-39193	Null Pointer Exception in Oracle LogSync backup stream handler
DLPX-57078	Job cancel requests during Oracle provisioning are not processed until the end of recovery
DLPX-57405	move-to-asm.sh does not support TDE-enabled databases
DLPX-62343	disable the OPTIONS method for all HTTP(S) requests
DLPX-64386	Oracle LogSync thread may hang when trying to remove temporary RMAN command file from source host toolkit directory
DLPX-65413	Ensure "source-archive" directory is unmounted at start of Oracle Provision
DLPX-66879	Oracle LogSync can create orphaned logs in certain scenarios
DLPX-69453	Provide tunable for Oracle LogSync client timeout
DLPX-69802	Common Toolkit directory is not removed from a mounted shared NFS location when the environment is deleted
DLPX-76382	Force disable should succeed despite environmental problems

Bug number	Description
DLPX-77840	Fixed an issue on the Setup pane to allow successful completion of an smtp test against a specific email address
DLPX-78412	SCM/Talaria failure reason should be communicated in the Delphix fault warnings
DLPX-78726	Removing windows environment performs cleanup of iSCSI persistent login target
DLPX-78754	Disable operation is prohibited on replicated sources
DLPX-78986	Prevent DSP connections for disabled Oracle RAC cluster nodes
DLPX-79077	Resolved an issue of an infinite spinner when validating BEQ credentials for Oracle dSource with duplicate unique_name. While linking a dSource, credentials are now required when discovering an unknown CDB.
DLPX-79242	Splunk HEC token logged to debug logs during splunkHec test
DLPX-79396	Allow users to unset Oracle database user name and credentials through CLI if Simplified Connection Management is enabled.
DLPX-79502	SnapSync fails if more than 1000 tempfiles exist in the whole CDB
DLPX-79591	Changed the NFSv4 minimum supported target Redhat version to 6.4 (was previously 6.3).
DLPX-79742	Unable to provision PostgreSQL VDB to Linux host with processor type of ppc64le
DLPX-79823	Improved the action item for failure to enable/attach the staging push dSource.
DLPX-79942	Improved the action item for failure to enable/attach the staging push dSource.

Bug number	Description
DLPX-80137	Limit SNMP configuration access to sysadmin
DLPX-80144	Oracle SnapSync crashes with NullPointerException when a PDB dSource is renamed and replaced with a new PDB of the same name
DLPX-80217	Fixed issue with filename conflicts during source backup restore
DLPX-80302	It was necessary to restart the auxiliary CDB during a TDE provision after recreating the autologin keystore
DLPX-80369	Oracle environment monitor triggers fault.oracle.db.connection.failed fault immediately on dataset stop or disable.
DLPX-80415	Fixes long delay in operations such as VDB start/stop when JDBC Thin connection to database fails due to unable to establish network connection.
DLPX-80439	Provide mount location to upgrade scripts during Lua to Python upgrade process if mount specification has not been provided.
DLPX-80440	Fixed spinner issue while provisioning a VDB from a SQL Server staging dSource from Provision VDB option in datasets menu
DLPX-80482	TDE-enabled provisions to a RAC target fail with "ORA-28365: wallet is not open" while attempting to reopen the database in start_database.sh in the auxiliary
DLPX-80483	Fix failing TDE-enabled vPDB provisions to a linked RAC container database due to "ORA-28365: wallet is not open" errors
DLPX-80487	Improved performance across dataset and replication related pages.

## Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-80078	The issue with removing files with complex file permissions on EBS is now fixed

## Release 6.0.13.1 changes

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-80818	libc upgrade necessitates PostgreSQL re-index.

## Release 6.0.13.0 changes

## Security Fixes

Bug number	Bug Introduced in	Description	Security Bulletin
DLPX-79789	5.3.0.0	Arbitrary Code Execution May Be Performed by Engine System Administrators.	<a href="#">TB096</a>

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-7868	The issue with the confusing vPDB error on a snapshot after resetlogs of a linked CDB is now fixed.
DLPX-41671	You can now update the Oracle cluster home through the user interface.
DLPX-43467	When dSource is an Oracle standby in RTA mode, LogSync was raising the fault.oracle.linkedsouce.log.conflict error and getting disabled on its own. This issue is now fixed.

Bug number	Description
DLPX-50309	Users can now change logSyncInterval for Oracle dsources.
DLPX-59757	The count for masking jobs fetched from the Masking Engine is now configurable. By default, it is set to 500.
DLPX-67604	The manual recovery of a database after V2P from a snapshot of dSource was failing with an error. This issue is now fixed.
DLPX-68684	The self-signed certificate is now compliant with the requirements for trusted certificates in MacOS 10.15.
DLPX-74613	Oracle VDB migration check needs to be done against the Oracle target host instead of the source. Furthermore, the Error and Action plan provided should include the target hostname.
DLPX-75467	The CLI now returns correct and descriptive error messages when executing unauthorized requests on uninitialized engines.
DLPX-75646	To diagnose BEQ connection failure, this release adds MD5 checksums for ojdbc*.jar for Oracle release versions up to currently supported release version.
DLPX-75878	The issue with the JDBC connection string for an Oracle vPDB not getting updated after an IP address change is now fixed.
DLPX-75989	The issue with the failure of environment discovery of an Oracle Cluster with a NullPointerException error is now fixed.
DLPX-76956	Previously, the Oracle JDBC test connection with the wrong password was increasing the <code>LCOUNT</code> value by more than 1. This issue is now fixed.
DLPX-77140	This release now speeds up metadata that is sent during replication when Extended retention is involved.

Bug number	Description
DLPX-77231	Previously, when source discontinuity on the dSource was followed by resync on the livesource, one or more livesource workers were failing to start. This prevented livesource status from getting updated and the first snapshot from being taken after resync. This issue is now fixed.
DLPX-77600	This release fixes NPE when Linking dSource with missing backup and unreachable nodes.
DLPX-77880	This release improves scalability for engines with an extremely large number of snapshots that were causing them to run out of memory.
DLPX-78015	Previously, V2P export with absolute data files was failing with an internal error. This issue is now fixed.
DLPX-78174	Insecure DES is no longer supported for SNMPv3.
DLPX-78420	This release adds V2P support for Windows server 2022 host machines.
DLPX-78473	This release improves load times for Datasets and Dataset Performance pages for engines with a large number of datasets and containers.
DLPX-78488	Previously, when switching from the backup server to ASE, dump history was not working for dSources configured to use the remote backup server. This issue is now fixed.
DLPX-78594	This release fixes an issue with disabled VDBs not being able to undo a refresh.
DLPX-78688	TLS 1.0 and TLS 1.1 ciphers are no longer available. Any system that is only configured with TLS 1.0 or TLS 1.1 ciphers is switched to use the default cipher set.
DLPX-78693	Invalid sync parameters will not cause DE server unavailability.
DLPX-78696	Switching sync strategy from source sync strategy type to sourceless strategy type is not allowed.

Bug number	Description
DLPX-79126	VDBs can now be automatically started with the tunables if stopped intermittently because Windows fail to write on the mount (Msg 9001).
DLPX-79292	This release eases restrictions on taking a snapshot of PDBs with encrypted UNDO tablespaces.
DLPX-79344	Previously, Snapsync of a standby PDB in mount mode was failing with the <code>ORA-01109: database not open</code> error message. This issue is now fixed.
DLPX-79422	Previously, clicking on a Replication Profile was resulting in the following error message <code>An error happened while communicating with the server</code> . This issue is now fixed.
DLPX-79789	Under certain conditions, arbitrary code execution may be performed by sysadmins.
DLPX-79808	This release fixes failures if the VDB name is more than 68 characters.

## Release 6.0.12.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-79151	The issue with remote syslog configurations preventing engine upgrades or virtualization service restarts is now fixed.

## Release 6.0.12.0 changes

### Log4j Updates

Based on detailed testing and analysis, all the currently supported products are not susceptible to known log4j vulnerabilities. Please refer to [TB095 Technical Bulletin](#) for more information. All instances of log4j in currently supported Delphix products are updated to **log4j 2.17.1** as of this release.

Delphix keeps you updated on the latest developments and keeps releasing hotfixes, procedures, and workarounds for such critical vulnerabilities. For more information on how Delphix supports our product and customers in such cases, see [Delphix Product Security](#)

For more information, refer to the following pages:

- [TB095 log4j vulnerabilities](#)
- [Uninstalling the delphix connector service from the target database servers](#)
- [Delphix product lifecycle policies](#)
- [Product security](#)

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-23068	Validation for target database parameter 'DB_FILES' for single-tenant databases for the following operations: provisioning, refresh, rewind, and converting a dSource to LiveSource is now added. Furthermore, specific error messages for handling ORA-00059 errors are added.
DLPX-44544	The issue with the SnapSync of an Oracle standby dSource in Real-Time Apply mode calculating the snapshot's timestamp incorrectly is now fixed. This issue was resulting in ORA-01194 or ORA-01152 errors when provisioning to a timestamp after the snapshot.
DLPX-56691	The issue with the data files of a VDB getting unmounted when provisioning, refresh, or rollback job is canceled manually is now fixed.
DLPX-57971	The issue with the latest snapshot of a LiveSource taking a long time to show the SCN/timestamp range on its card in the GUI is now fixed.
DLPX-60320	UI now allows the selection of older dataset repositories (downgrade) in addition to selecting newer ones (upgrade).
DLPX-67069	The issue with the stopped Oracle VDB monitoring by the environment monitor that resulted in connection errors flooding the debug log is now fixed.
DLPX-68132	The issue with the “Copy query to clipboard” SQL copy functionality in the “Managed Source Data” is now fixed to have correct apostrophe characters.

Bug number	Description
DLPX-72123	The issue with the failure of detaching or deleting an Oracle dSource operation on RAC environments (This issue was occurring due to failure of deletion of RMAN backups on RAC and the operation needs to be retried with a force option) is now fixed.
DLPX-72779	The UI showing enabled or disabled for cluster nodes now uses a grid table. The Enabled column contains a checkmark to show whether the cluster is enabled or disabled. Users are able to select or unselect the checkmark to enable or disable a cluster.
DLPX-73975	Critical storage faults should not be ignorable nor manually resolvable
DLPX-74862	This release fixes an issue where the RESUME operation failed without any error thrown to the user on dSources where ENFORCE was still in progress. The fix will make sure that even if RESUME fails, it throws a DUE to the user with suggested actions to resolve the issue.
DLPX-75763	The issue with the failure of refreshing a VDB provisioned as an empty vfiles since there is no parent container to refresh from is now fixed.
DLPX-76266	The issue with the VDB Disable operation that resulted in an error message while connectivity with the host machine can't be established is now fixed.
DLPX-77123	You can now run Upgrade Verify when another upgrade is in progress.
DLPX-77347	This release fixes the difference in time shown for MSSQL snapshot based on different database authentication methods.
DLPX-77638	The issue with the failure of the End Entity Certificate expiration fault is now fixed.

Bug number	Description
DLPX-77664	The issue with the failure of the Oracle SnapSync with an error message, "RMAN-06183: datafile or datafile copy (file number ) larger than MAXSETSIZE" if a datafile resized in the middle of SnapSync is now fixed.
DLPX-77913	The issue with the faults table missing data if there was more than one page of faults is now fixed.
DLPX-77925	The issue with the unsupported Windows release error message is now fixed.
DLPX-78113	MSSQL VDB database size will now be refreshed periodically based on environment_monitor.dynamic_attributes_check_period tunable.
DLPX-78183	The issue with the MSSQL validated sync schedule not getting updated without successful backup restoration is now fixed.
DLPX-78244	The issue with the failure of a few operations on self-service containers due to incorrect entries corresponding to the Oracle log metadata on the Delphix engine is now fixed.
DLPX-78258	The issue with the input bug that retained cleared out DB credentials in the dSource linking wizard is now fixed.
DLPX-78263	The issue with the failure of a SnapSync of an Oracle standby dSource in Real-Time Apply mode with an error message, "exception.oracle.snل.linkedsource.current_scn.invalid" if the rate of change in the database is low is now fixed.
DLPX-78265	Offline Oracle bystander PDBs data files can now be optimized leading to improved provision performance.
DLPX-78309	The issue with the CLI being unable to log in to system users when the main virtualization service is down is now fixed.

Bug number	Description
DLPX-78334	The issue with a large number of missing Oracle archive logs causing an error while viewing dataset is now fixed.
DLPX-78392	Hosts running Windows Server 2022 can now be added as Source and Target environments to the Delphix Engine.
DLPX-78522	SSLv3, TLS 1.0, and TLS 1.1 are no longer configurations options for HTTPS. Any system configured only with these removed options will be automatically set to use TLS 1.2.
DLPX-78791	This release upgrades log4j from 1.2.17 to the latest 2.x in Windows Connector.
DLPX-78938	This release upgrades log4j in virtualization to 2.17.1.

## Release 6.0.11.0 changes

### Security Fixes

Bug number	Bug Introduced in	Description	Security Bulletin
DLPX-77921	6.0.8.0	Arbitrary Code Execution by Delphix System Administrators may be Performed on Virtualization and Masking Engines	<a href="#">TB094</a>

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-53019	The issue with the missing redo alert raised during the environment monitor check has now been resolved.

Bug number	Description
DLPX-59299	Discovery and monitoring rely on "Connected" in sqlplus output, which may not be the case if NLS_LANG is set to another language (e.g. Japanese). Downstream operations, like linking or provisioning, may then fail due to missing user privileges.
DLPX-59662	The issue with copy-Only Backups failure with Virtual Service Accounts has now been resolved.
DLPX-62706	The issue with the Hostchecker not properly checking /home/delphix permissions has now been resolved.
DLPX-64082	The issue with Oracle Provisioning scripts having hard-coded timeout issues has now been resolved.
DLPX-65729	Added retry functionality to the 'read backup files' operation during a validated sync to an account for an unstable environment.
DLPX-69778	SAML response is not logged on successful SSO login.
DLPX-72043	The issue where LiteSpeed <code>xp_restore_headeronly</code> stored procedure failure message are displayed when validated sync is active for dSources with LiteSpeed backup has now been resolved.
DLPX-72220	A UI issue that occurred while updating the vault when only the private key is changed has now been resolved.
DLPX-72225	Admin user created from management UI is no longer showing as 'non-admin' type.
DLPX-72237	The 'Verify Credentials' button from the DSP Throughput test page is now removed.
DLPX-72369	The dependency on a parent snapshot relying on the latest snapshot is now removed if a parent snapshot does not exist during the VDB enable operation.

Bug number	Description
DLPX-72778	Oracle dSource attach operation with changed DB ID using 'Force' option is now allowed.
DLPX-74555	Updated the "no Delphix connector" message while provisioning a Windows source environment.
DLPX-74676	Oracle LiveSource LogSync should only catalog valid archive log files.
DLPX-74851	In the Add Environment GUI, the mouseover information for "Set Delphix Session Protocol Options (DSP)" has been currentted.
DLPX-74896	The race condition issue when running Oracle VDB refresh and dSource snap sync resulting in incorrect MDS entry for the parent snapshot of a VDB in the <code>d_lpx_timeflow</code> table has now been resolved.
DLPX-75335	Added a product name and product version for the Delphix Connector executable so this information can be available before installation.
DLPX-75500	For ag cluster nodes, if the refresh fails due to timezone discovery failure, don't delete the nodes from MDS as it doesn't mean we had an issue with the nodes.
DLPX-75952	Database configs will be replicated only if the associated VDB is replicated.
DLPX-75995	The issue causing environment 'Add' or 'Refresh' to fail when PowerShell Transcription is enabled has now been resolved.
DLPX-76244	The issue where TCP fallback connection to database stops responding if the Oracle database instance is down has now been resolved.
DLPX-76290	Databases of UNKNOWN cdb type are now included in the attachment of a non-PDB container.

Bug number	Description
DLPX-76731	Added Delphix support for <code>WALLET_ROOT</code> and <code>TDE_CONFIGURATION</code> parameters to manage wallets in 19c instead of <code>sqlnet.ora</code> .
DLPX-76759	Added "Response" to faults along with other details when logged in the Admin App.
DLPX-76777	Remove orphaned Oracle logs resulting from archive log fetch timeouts.
DLPX-76793	Added execution timeout for execution of <code>UpdateFileACL.ps1</code> .
DLPX-76974	The issue where a user was unable to change 'from address' of SMTP server to <a href="mailto:noreply@delphix.com">noreply@delphix.com</a> in the GUI has now been resolved.
DLPX-77112	The issue where an Oracle VDB cannot be provisioned between different minor versions if the Source is on higher RU has now been resolved.
DLPX-77284	The issue where after a hotfix was removed due to a successful upgrade, the system would still indicate the hotfix was installed post-upgrade has now been resolved.
DLPX-77345	The issue where provisioning a vVDB fails with <code>java.lang.OutOfMemoryError</code> when <code>sqlplus</code> is used to rename the datafiles has now been resolved.
DLPX-77405	Replicated password vaults will no longer be visible in the UI.
DLPX-77676	The issue where provisioning a vPDB from a PDB dSource fails with "ORA-65114: space usage in container is too high" if PDB <code>max_size/</code> <code>max_pdb_storage</code> is configured has now been resolved.

Bug number	Description
DLPX-77708	The issue where a refresh/disable/destroy of a VDB using NFSv3 could cause loss of access to other VDBs that were using NFSv3 has now been resolved.
DLPX-77844	The issue where V2P operations from a VDB snapshot would result in the deletion of any production datafiles that exist on specified V2P target directory has now been resolved.
DLPX-77904	Removed 'Factory Reset' for Delphix Engines that are Data Vaults, as the operation is disabled for those engines.
DLPX-77912	The issue that can cause a VDB stop, refresh, or rollback to fail with an internal error has been resolved.
ORB-2465	Removed the requirement that SAML SSO email addresses must match case-sensitively for SSO logins.

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-77577	Increased nvme I/O timeout to prevent storage issues in EC2 (Activated after optional Reboot).

### Release 6.0.10.1 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-77467	Loading the setup app dashboard (as sysadmin) was rendering a server error popup with instruction to contact Delphix Support. This 6.0.10.0 error has been known to impair the ability to configure web proxy, PhoneHome, SMTP servers, and other connectivity settings via the GUI. It has now been resolved.

## Release 6.0.10.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-18438	The issue with provisioning to the latest available time that resulted in generating the <code>exception.oracle.target.point.not_provisionable</code> exception has now been resolved.
DLPX-35480	Previously, static routes were being added using the <code>add</code> command. Now, the same can be added using the <code>create</code> command.
DLPX-57516	The issue with the failure of management service to start after configuring some abbreviated timezones from a picklist in server setup or sysadmin CLI has now been resolved.
DLPX-58133	Previously, the Oracle SnapSync operation was resulting in a warning for BCT usage on editions that do not provide it. This issue has now been resolved.
DLPX-58675	The issue with the deletion of the last snapshot on timeflow by Retention during a failed Oracle DB_SYNC operation has now been resolved.
DLPX-63003	The issue with memory being exhausted while reading too many snapshots from MDS has now been resolved.
DLPX-63347	If the staging source has the "Use as Staging" flag set as off, the user was seeing a specific exception while trying to enable a linked dSource to point in the direction of what needs to be done. Any compatibility failure will now have a specific exception.
DLPX-63601	Previously, querying the following operation "backupset table" and "whether a database is part of AG or not" was resulting in deadlocks and lock timeouts errors. We have now added retries to resolve the issue.

Bug number	Description
DLPX-64369	The issue with throwing <code>fault.oracle.linkedsource.incomplete.tempfile</code> for physical standby has now been resolved.
DLPX-65949	The issue with misleading status in the progress bar while taking a copy-only backup has now been resolved.
DLPX-69831	Previously, the Oracle dSource SnapSync operation was not displaying a clear failure message if a dSource <code>db_unique_name</code> is changed. This issue has now been resolved.
DLPX-70317	The issue with the restarting of the NFS-server by the reaper thread while deleting a vPDB from a linked CDB with Talaria turned on has now been resolved.
DLPX-71018	The issue with UI displaying only the suffix of the device name used by Hyper-V has now been resolved. UI now displays a unique device name for storage in Hyper-V.
DLPX-71292	The issue with the allowance of incremental SnapSync after LogSync throws <code>fault.oracle.linkedsource.log.conflict</code> has now been resolved.
DLPX-71639	The NFSv4 is now set as the default option when mounting datasets from OS platforms that support it.
DLPX-71769	The need to set permissions of <code>\$ORACLE_HOME/dbs</code> subdirectories using STARTUP SPFILE syntax is now removed.
DLPX-72011	The issue with the CLI network setup not configuring the first network interface when multiple interfaces exist has now been resolved.

Bug number	Description
DLPX-72186	The issue with CDB log file retention working incorrectly if a PDB has multiple time flows pointing to the same CDB timeflow has now been resolved.
DLPX-72432	The format of <code>zpool_iostat_60.log</code> has been enhanced in this release. A timestamp is recorded for each sample in the log, making it easier to determine the time for each sample.
DLPX-72956	The issue with disabling the Oracle LogSync after running the validated sync job has now been resolved.
DLPX-73575	The timezone monitoring is now added for the Windows hosts.
DLPX-73590	You can now refresh a VDB whose parent dataset is in a different group without needing authorization on the parent or its group.
DLPX-73800	The issue with the failure of olsnodes when run as a non-Oracle user has now been resolved.
DLPX-74504	The issue with throwing a new DUE and NotFoundException when ojdbc libs cannot be read has now been resolved.
DLPX-74945	UI now displays a detailed error message for transaction log-chain break fault.
DLPX-74992	The issue with the failure of SnapSync operation when Database incarnation reset-logs end time is changed from "2021-03-13 22:03:07.0" to "2021-03-13 21:03:07.0" for virtual pluggable database " " has="" now="" been="">">
DLPX-75389	The issue with the recording of the insufficient details by Logsync when dbid change was detected has now been resolved.
DLPX-75517	The issue with the failure of the Oracle vPDB provisioning with the "ORA-00959: tablespace 'TEMP' does not exist" error has now been resolved.

Bug number	Description
DLPX-75721	The issue with the failure of an Environment discovery with the "DelphixFatalException: Unknown Oracle Database status: REFRESHING" error has now been resolved.
DLPX-75737	The issue with saving unnecessary logs by Retention if bookmark falls exactly on a snapshot end SCN or snapshot end timestamp has now been resolved.
DLPX-75897	Previously, failure to start I/O services after the upgrade operation was resulting in a stack restart loop. This issue has now been resolved.
DLPX-75951	The internal error being signaled during VDB SnapSync by <code>removeUnneededZFSFiles</code> when a data file is physically removed during processing by an external cause has now been resolved.
DLPX-76288	The NFS latency for workloads involving a lot of parallel I/O (e.g. Oracle VDBs with concurrent accesses to many data files) is now improved.
DLPX-76388	Previously, entering key pairs directly into hook environment variables, as opposed to via a vault or as passwords were resulting in an internal error. This issue has now been resolved.
DLPX-76406	The issue with NFS-based VDBs becoming unresponsive has now been resolved.
DLPX-76447	The issue with the V2P Functionality to customize target directory structure for exporting database files to separate file systems not working as documented has now been resolved.
DLPX-76613	The issue with the unnecessary accumulation of heap when validated sync is active for dSources using an environment user that eventually can cause out of memory issues has now been resolved.
DLPX-76690	The issue with the removal of extraneous Oracle data files while creating snapshots has now been resolved. The extraneous Oracle data files are now removed during the provisioning operation.

Bug number	Description
DLPX-76692	For V2P operation, we now use the unbuffered copy method for better performance.
DLPX-76718	The issue with the creation of the extraneous Self-Service branch segments during the replication operation has now been resolved.
DLPX-76760	Environment clusters will now show faults from their child nodes.
DLPX-76802	Previously, the engines that are in the DEFERRED upgrade state were resulting in the "Large Receive Offload" option turned off which was leading to performance degradation in network transfers. This issue has now been resolved. Upgrading the engines that are in the DEFERRED state will also resolve the issue.  Screen reader support is now enabled.
DLPX-76891	CRON expression labels now ask for Quartz format on the user interface.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-76619	The NFS reliance on DNS to prevent VDB unresponsiveness related to DNS unreliability is now reduced.
DLPX-76203	The NFS latency for engines with many Oracle dNFS clients is now improved.
DLPX-76119	The issue with the Delphix Engine crashing or becoming unresponsive when canceling a replication job has now been resolved.
DLPX-76991	Optimized in-memory cache eviction by making minor improvements to I/O performance.

## Release 6.0.9.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-28435	MS SQL instances PatchLevel will be displayed in preference to the version on the UI.
DLPX-40005	Improved the error message that is displayed when a JDBC connection cannot be established or the Oracle database Instance is unavailable.
DLPX-48080	Oracle Home Check may generate spurious faults if Oracle Home entry does not exist in /etc/oratab.
DLPX-55951	Attempting to provision a plugin-based VDB onto an incompatible OS (Windows to Linux or vice versa) is possible in the UI, and would fail with a crash requiring a restart. Now an informative error message is shown after the attempt is made.
DLPX-59613	Fixed creation of retention policies workers on replica objects after failover.
DLPX-64307	Environment refresh should ignore cluster discovery for Oracle VDBs.
DLPX-66191	Fixed the side-effects of the native Windows "Recent Files" behavior, when large numbers of PowerShell operations are being run concurrently.
DLPX-67537	Domain administrators can now create, view, and edit the alert profiles of other domain users.
DLPX-69605	Poor error message when selecting Timeflow range.
DLPX-70502	On detaching a dSource, delete backup server entry from MDS and related ones if the backup server is unused.
DLPX-71002	In case we have null values coming for recovery_model from msdb.dbo.backupset table, the user will see a generic exception for manual sync and a fault for validated sync.

Bug number	Description
DLPX-71908	Users will now see a warning when they remove any object from the replication specification list.
DLPX-72012	Prevents the same IP address from being configured on more than one network interface.
DLPX-72411	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-72609	When we do MSSQL standalone environment discovery, the user will see a warning for databases attached to AG that are present and will not be discovered unless cluster environment discovery is selected.
DLPX-72695	Improved Oracle SnapSync performance by eliminating unnecessary calls to getTotalHoleBlocks.
DLPX-73409	Duplicate listener entry gets generated in MDS if Oracle listener is manually started with a non-uppercase name.
DLPX-73586	Fixed a display error of some snapshot names in the command line interface which showed references instead of actual names.
DLPX-73720	Provisioning an Oracle vPDB fails with "ORA-65149: PDB name conflicts with existing service name in the CDB or the PDB" if the PDB and CDB names are the same.
DLPX-74050	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-74078	The Target Directory path is combined with other directories such as Data Directory, Archive Directory, Temp Directory, etc to build the full path for data files, archive logs, temp files, etc. As long as the combined paths are valid the V2P job proceeds.
DLPX-74197	Fixes a misleading warning about insufficient space on a replication target.

Bug number	Description
DLPX-74201	Snapshots created as a result of refresh or rewind operations will now be labeled as just "Snapshot" to avoid confusion. Users are advised to look at the Timeflow markers to know when the Timeflow operation was performed.
DLPX-74367	Delphix Engine repeatedly reports "Failed to parse logfile".
DLPX-74377	Improved diagnostics information for the case when Delphix Engine fails to connect to the Windows host.
DLPX-74387	fix an issue that causes the management service to crash under heavy CPU load.
DLPX-74398	Added handling of dangling nodes during Windows cluster environment add and refresh operations.
DLPX-74486	Delphix OS users cannot provision 12.2 TDE vPDB due to directory permissions in the default wallet location.
DLPX-74495	Enabled more logging in Delphix connector logs for timeouts.
DLPX-74681	During RAC vPDB provision, Oracle 19.9 target CDB crashes with ORA-00600 [krccf_chunk] when BCT is enabled.
DLPX-74806	Improved error message displayed when the storage device initialization fails unexpectedly.
DLPX-74860	Provisioning the 2nd generation VDB fails if the dSource has imported read-only transportable tablespaces fails.
DLPX-74975	Allow adding invalid or unreachable paths as a shared backup location for dSources.
DLPX-75026	Invalid JDBC connections are not purged from the connection pool when the home is changed.

Bug number	Description
DLPX-75134	Improved performance for the Environment Databases pages when there are a lot of databases.
DLPX-75363	Update exception description is seen when the SnapSync fails for ASE encrypted database.
DLPX-75401	local listener set to null if oracle.lsnr.protocol_registration_order is quoted.
DLPX-75506	Fix a bug that can cause Oracle RAC VDBs to fail with stale NFSv3 mounts if NFSv4 is also enabled.
DLPX-75532	Insufficient heap memory settings on AIX cause connector and SnapSync to hang or crash.
DLPX-75663	FIPS compliant algorithms will be used while merging the old and new toolkit directories during environment refresh.
DLPX-75716	Delphix may remove Oracle VDB temp tablespaces during Snapsync.
DLPX-75735	Fixed creation of retention policies workers on replica objects after failover.
DLPX-75834	Rearranged Syslog configuration dialog inputs to avoid confusion and have a more consistent user experience.
DLPX-75858	BEQ processes can hold on to file descriptors leading to hook scripts hanging after upgrading to 6.0.7.0.
DLPX-76018	Remove hardcoded 5-minute timeout for doDropPDBKeepDatafiles.sh.
DLPX-76140	TDE SnapSync should ignore WARNING plugin violations.

## Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-71980	Fix a bug that was causing the Delphix Engine storage pool to fail to import on boot under certain circumstances.

## Release 6.0.8.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-75804	Some Delphix operations may fail if mount and umount commands, on staging or target hosts, are setup to run as sudo and if sudo rules prohibit these commands from running with unrecognized options. The issue is fixed now after removing "-v" added in 6.0.8.0.

## Release 6.0.8.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-49694	Skip parsing of DBCC when code 0 is not present in the DBCC page output. In case the DBCC page has code 0 but not dbid, use bdbid (present in the buffer section).
DLPX-68764	VDB SnapShot does not progress if ASE database devices are not on Delphix storage, environment monitoring raises a fault. Subsequent VDB operations like enable, disable, start, stop, delete, snapshot, or refresh will fail.
DLPX-70793	Delphix Engine should not allow linking Oracle DB with null <code>db_unique_name</code> .

Bug number	Description
DLPX-71300	For newer ASE versions ( $\geq$ 15.7 SP138 and 16.0 SP02 PL05 and ASE 16.0 SP03), do not run DBCC PAGE anymore, as it was an identifier for DBCC CHECKALLOC that is already not run.
DLPX-71471	Error message asking user to manually perform disable/enable operation or correctly rename the target database back will be displayed during Start VDB, if VDB does not exist.
DLPX-71687	Provide a mechanism to enable VDBs up to filesystem mount point.
DLPX-71875	Fixed a bug that results in a memory reservation not being represented correctly in the Delphix API.
DLPX-72046	Deletion of vPDB in a vCDB shows this warning, "Encountered an error while shutting down and cleaning up Oracle files."
DLPX-72209	Downloading a support bundle is not supported at the same time that an upload of an upgrade image has been initiated by the same Delphix user.
DLPX-72319	Fixed an issue where some error dialogs would freeze in Internet Explorer 11.
DLPX-72705	Connection timeout when deleting remote shipper script can cause a timeout in LogSync client.
DLPX-72757	ASE sync using Dump History fails for large dump history files.
DLPX-72780	Timezone is set incorrectly for snapshots of Solaris 10 dSources and VDBs.
DLPX-72904	Storage capacity now includes usage from all file system objects, not just snapshots.
DLPX-73143	Fixed an issue where the support bundle dialog showed a loading spinner intermittently while jobs were running.

Bug number	Description
DLPX-73354	Traverse all shared backup locations while syncing, even if some of the paths are invalid or not reachable.
DLPX-73489	Fixed bug where adding or editing a parameter using the UI VDB Config Template "Text" tab was truncating the parameter's value.
DLPX-73602	Incorrect mount options used when a single instance RAC is linked as a standalone single instance.
DLPX-73607	Added paging for days with large numbers of snapshots to prevent slowdown.
DLPX-73623	Fixed an out-of-memory condition that occurs in SSH tunneling for encrypted log-syncs when storage latencies are high.
DLPX-73627	The help text on upgrade replication warnings have been updated to avoid confusion between Ignored and Resolved.
DLPX-73668	Fixed Missing security headers.
DLPX-73669	Cross-site request forgery (CSRF) issue in management UI.
DLPX-73727	Fixed an issue where the faults table was unable to navigate to other pages.
DLPX-73797	Fixed VDB refresh failures due to SQL Server Error 924 after setting VDB to single user mode.
DLPX-74025	Implemented logic to retry offline database along with a drop database to overcome deadlocks while off-lining or dropping the database.
DLPX-74029	VMware Hot-Add memory is not immediately reflected in the system API.
DLPX-74057	Fixed a typo in "Download Support Bundle" UI component where the word "suport" was missing a "p".

Bug number	Description
DLPX-74254	Ownership of files inside VDB now matches new owner when VDB owner is changed.
DLPX-74298	Fixed an issue where the user could not upload a keystore with a blank keystore passcode.
DLPX-74362	Fixes an issue with namespace deletion when the replication receive jobs have been cleaned up.
DLPX-74442	VDB Enable with attemptStart=false will now mount the datasets so that VDB can be started.
DLPX-74457	Cluster discovery for Oracle RAC clusters are partially failing on Solaris 10.
DLPX-74529	Fixed a bug so that an upgrade completes even when jobs fail.
DLPX-74542	Fixed a bug so that upgrade completion is properly handled after kernel upgrades.
DLPX-74645	Delphix Engine uses the uptime command to keep track of a target host reboot and auto start VDBs on the host. In some cases, the output of this command is not what is expected and causes unintended restart of a stopped VDB. This issue is now fixed.
DLPX-74656	Oracle errors during doCreateSPFile.sh are not captured.
DLPX-74704	Fixed a bug where the Dataset scroll does not extend to the bottom of a dataset list, thus truncating the status of the last dataset in the expanded group.
DLPX-74883	Prevent support bundle collection from cancelling replication.
DLPX-74911	Talaria TCP fallback fault may be misconstrued if an Oracle RAC node is down.
DLPX-74997	Prevent granting replicated roles to users.

Bug number	Description
DLPX-75083	Post upgrade cleanup task may become unresponsive while attempting a migration from 5.3.x to 6.0.x due to several threads stuck in WAITING state.
DLPX-75095	Provisioning an Oracle VDB fails if change-archivelog-mode.sh takes longer than 5 minutes.
DLPX-75134	Improved performance of the Environment Databases page under certain conditions.
DLPX-75188	Fixed "out of memory" issue when processing a large number of objects on the Target engine.
DLPX-75204	Addressed a performance issue on the Target engine when receiving large number of replicated objects.
DLPX-75208	Snapshot names are incorrectly redacted in the MDS dlpx_action table in support bundles.
DLPX-75416	Fixed a replication issue when there are sources with TLS enabled.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-72065	Fixed a bug that can cause a Windows iSCSI initiator to fail connect to the Delphix Engine.
DLPX-72681	Console Delphix status screen shows a Python stack trace if the system is configured with a static IP address.
DLPX-73423	Console Delphix status screen shows a Python stack trace if the system has no default route.
DLPX-74216	Fixed an issue that causes management service failures in low memory situations.
DLPX-74622	Fixed a bug that can cause a replication job to fail with an internal error.

Bug number	Description
DLPX-75089	Fixed a bug that can cause NFSv3 clients to lose locks during upgrade verification.
DLPX-75524	Fixed a bug that can lead to Oracle data corruption when running VDBs on Oracle 19c with dNFS.

## Release 6.0.7.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-39006	LogSync failed with "Cannot read archived log due to failure of log shipping script".
DLPX-39245	Fixed a bug that caused the management service to become inaccessible if the storage pool ran out of space.
DLPX-59155	Provisioning a VDB or vPDB failed with unclear error message 'A database with the name "xxx" already exists'.
DLPX-60317	Fixed Out of Memory issue when replicating a large number of objects.
DLPX-60947	Replica VDBs will be updated when performing a point-in-time restore.
DLPX-62805	vPDB provision did not raise an error when a non-provisionable target point-in-time was provided.
DLPX-62969	Fixed Out of Memory issue when receiving large number of replicated objects.
DLPX-64600	Skipped connecting to ASE dSources during SnapSync policy runs as it is not applicable for them, hence prevent recurrent faults that the policy throws for connectivity issues.

Bug number	Description
DLPX-67363	Maximum identify provider authentication time age can be customized for single sign-on.
DLPX-67607	Fix to make Snapsync throw exception if manifest file is missing or of 0 bytes instead of internal error with null pointer exception.
DLPX-67767	Fixed a bug that caused the upgrade to hang, while waiting for running jobs to finish.
DLPX-70821	Allow the entity id for SAML single sign-on to be a URL for compatibility with Azure AD.
DLPX-71783	doRenameDatafiles cleanup of extra files fails due to file permissions mismatch.
DLPX-72010	Fixed an issue that prevents changing the default gateway using the network setup CLI.
DLPX-72075	Maximum SAML response time skew can be customized for single sign-on.
DLPX-72191	Oracle privilege discovery not performed for all homes if an invalid home exists.
DLPX-72351	When a user tries to change credentials for a dSource, validating the credentials before updating them. In case of invalid credentials, showing user an error message about it.
DLPX-72545	Initial ORA-65294 error not reported to user when vPDB provision fails due to compatible parameter mismatch.
DLPX-72652	Fix and issue that prevents use of the NFSv4 on some versions of SUSE Linux targets.
DLPX-72698	Patching Oracle 19C vCDB leads to ORA-25153 as described in 2285159.1.

Bug number	Description
DLPX-72807	Fixed issue with SQL Server 2014 dSources with filestreams where sync failed in merging filestream directories due to long path names.
DLPX-72882	Datasets hooks script editor properly displays multiline scripts instead of as one long line on non-Chrome browsers.
DLPX-72916	Empty string in SNMPv3 USM username creation no longer throws fatal error.
DLPX-73048	Non-sys user credentials for Oracle sources cannot use password vault.
DLPX-73108	Fix a bug that prevents the API from displaying the correct number of CPUs or amount of memory assigned to a Delphix Engine after a hot-add operation.
DLPX-73201	Fix an issue that prevents the configuration of additional NICs on Azure Delphix Engines.
DLPX-73202	Fix a bug that can cause a VDB to fail to mount while other VDBs are being stopped.
DLPX-73424	Fix a bug that prevents the sysadmin from deleting a default route.
DLPX-73527	SnapSync job fails with 'internal error during execution' due to ONS/FanManager errors.
DLPX-73528	Fixed a bug that prevented accessing SDD specs from CLI.
DLPX-73611	Kerberos ticket expiration date parsing is incorrect after migration from Illumos to Linux.
DLPX-73742	Provisioning an Oracle TDE-enabled vPDB fails with the error "ORA-28367: wallet does not exist" if the TDE wallet for the target linked CDB is stored on ASM storage.

Bug number	Description
DLPX-73765	Fix a file descriptor leak that causes the management service to crash over time.
DLPX-73789	Auxiliary CDB instance uses dSource keystore location if WALLET_ROOT is configured in dSource.
DLPX-74030	CDB database password may be leaked as part of environment monitor checks that launch sqlplus command on the source or target host.
DLPX-74043	Delphix OS user cannot provision TDE-enabled vPDB due to directory permissions in the default wallet location.
DLPX-74044	Delphix OS user cannot provision TDE-enabled vPDB in Delphix-writable keystore location due to directory permissions.
DLPX-74119	Drop database fails if default database is set to any other than master.
DLPX-74164	Sync fails with db.aselddb.source.dump_history.incomplete_stripes after dump history file is purged and Use dump history is enabled for the dSource.
DLPX-74233	During failover of a namespace, if there is a collision between an environment in the namespace with one on the target engine, the namespace environment will get renamed if its host does not match that of the environment on the target.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-73390	Improve replication receive throughput.
DLPX-73393	Improve write performance under extreme disk fragmentation.

Bug number	Description
DLPX-73280	Improve write performance under extreme disk fragmentation.

## Release 6.0.6.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-73848	Fixed an issue that can cause the management service to fail to start after upgrade on systems that have had SNMP enabled.
DLPX-73859	Fixed a file descriptor leak triggered by faults and alerts that can cause the management service to fail.

## Release 6.0.6.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-47065	VDB recovery failed when files other than archive logs were detected by Oracle.
DLPX-47493	Fixed the bug where VDB directory under the DelphixConnector directory was not being removed from the target host on MSSQL VDB deletion.
DLPX-48046	Added sorting parameter to network test APIs.
DLPX-61405	Replication may send more data than expected if masking involves dropping large DBF files.
DLPX-61525	The height of the storage configuration list was limited to show 3 disks at a time. It will now dynamically grow with the number of disks.

Bug number	Description
DLPX-63603	Increased connector timeout from 10 minutes to 30 minutes to avoid unnecessary faults due to timeout during Validated Sync operation.
DLPX-67368	Delphix Engine hostname change is now immediately reflected in Splunk events.
DLPX-67593	Fixed an issue that caused the management service to remain offline following an out-of-space condition.
DLPX-68531	Introduced better handling of UniversalConnectionPoolException errors during SnapSync.
DLPX-69759	Oracle environment discovery failed due to an unhandled exception occurring at insert into dlp_x_faults.
DLPX-69852	Fixed a bug that caused network configuration problems when removing and adding additional NICs.
DLPX-70426	Redaction of usernames took forever on tables with millions of entries.
DLPX-70583	move-to-asm.sh fails if timing is set in glogin.sql.
DLPX-70638	Removed Failed Actions section of Actions sidebar, in favor of manually dismissing from Running Actions and falling to Finished Actions section.
DLPX-70653	Removal of all instances in a RAC VDB should not be allowed.
DLPX-70808	Fixed issue related to the creation of empty DisableBroker.sql on the Windows machine in case DisableBroker.sql execution fails in the first attempt.
DLPX-70896	Added more detailed error message for when the Delphix Engine fails to push a script to Windows host.
DLPX-70919	Fixed an issue that causes job progress to not update in Self-Service.

Bug number	Description
DLPX-70928	Fixed a bug that results in a Delphix Engine remaining powered on following a shutdown from the user interface.
DLPX-71093	For AG databases, a full backup is not required even recovery fork guid changed but the LSN chain didn't break because of transactional log backups.
DLPX-71097	Unable to ignore snl.bct.needed warnings if Block Change Tracking is legitimately disabled on an Oracle dSource.
DLPX-71153	Recovery of PDB should fail if the database is down after offlining datafiles.
DLPX-71370	While deleting initiator in Windows environment deletion operation, delete all the views as well for that initiator.
DLPX-71685	VDB is auto disabled if the hook fails.
DLPX-71865	Reduced the size of support bundles.
DLPX-71961	When a PDB is selected for replication, its CDB and all other PDBs in the parent CDB get automatically selected for replication. Going forward, in the above scenario, while the CDB will get selected, its other PDBs will no longer get selected.
DLPX-72031	Fixed VDB refresh operations failures due to 'DB STARTUP' background process spid greater than 50.
DLPX-72066	Migrate VDB verifies against the old configuration, rather than new.
DLPX-72083	Fix an issue that causes a fully-qualified hostname to be changed on upgrade from 5.3 to 6.0.
DLPX-72131	Added namespace support for HashiCorp password vaults.

<b>Bug number</b>	<b>Description</b>
DLPX-72265	doCreateTempfiles.sh.template exits with code 0 on failure.
DLPX-72340	Incomplete recovery not detected during provisioning.
DLPX-72386	Unlock Solaris x86 Solaris -> Linux x86 provisioning.
DLPX-72452	For clusters with long hostnames, vPDB sync fails with exception.oracle.accessor.instances.missing.
DLPX-72495	Fixed a bug that prevents the application from coming up after an upgrade
DLPX-72686	Delphix no longer logs environment variables in logs on connected hosts since this could leak sensitive information such as passwords that are sometimes stored as environment variables on database hosts such as for the ASE database.
DLPX-72730	Fixed a Snapsync performance issue.
DLPX-72790	SnapSync job fails with 'internal error during execution' due to ORA-01652.
DLPX-72862	The scenario which was causing the null pointer has been fixed now.
DLPX-73300	Validation of connection to a container for PDBs should allow connecting to CDB\$ROOT.
DLPX-73311	Added platform detection for ESX 7.0u1.
DLPX-73449	Replication of policies between two engines, in a loop, could lead to OOM exceptions.

### Fixes that take effect after an optional reboot

<b>Bug number</b>	<b>Description</b>
DLPX-72990	Addressed a minor CVSS 5.9 security issue with no known attack vectors.

Bug number	Description
DLPX-73067	Fix for CVE-2020-10753.
DLPX-73069	Fix for CVE-2020-12059.
DLPX-73070	Fix for CVE-2020-1760.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-71924	Fixed a bug that causes support bundle collection to fail with an internal error.
DLPX-72918	Fixed a system crash that can happen when replicating a masked VDB using SDD.
DLPX-73147	Fixed a bug that can cause a replication source to crash if it had run replication while running on 5.0.

### Release 6.0.5.0 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-23360	The unistallation of the Delphix Connector installer should succeed even if one of the component connector services doesn't exist.
DLPX-69155	Reduced the time taken to generate support bundles in some cases.
DLPX-67316	Recreating a controlfile against an Oracle source may yield misleading error during snapshot.
DLPX-70766	JDBC driver updated to resolve intermittent JDBC connection failures due to JDBC SSL bug.

Bug number	Description
DLPX-70785	Options passed to VDB mounts on target AIX hosts did not include read and write size values. This fix adds the rsize and wsize parameters to mount command depending on the maximum values host is configured to support.
DLPX-70741	Enabling Validated Sync while SAP ASE SnapSync job is running leaves staging database unrecoverable.
DLPX-69865	Fixed a bug that causes a network interface to become unconfigured if its MAC address changes.
DLPX-71233	If LogSync is suspended when performing SnapSync of a standby database in real-time apply, SnapSync attempts to backup the archived logs which can cause SnapSync to become unresponsive.
DLPX-69800	UEM/Hostchecker directory ownership checks fail on HPUX environment with long usernames.
DLPX-69807	Provided mechanism for the user to bypass corrupted/incomplete jdbc libraries.
DLPX-66585	Bundle ID "fault.environment.configuration.file.owner" reports insufficient host address.
DLPX-65739	createDelphixDBUser.sh fails when "@" used in the password.
DLPX-70973	SAP ASE database provisioning fails if the source database has holes in log fragments.
DLPX-71532	Improved error handling for Oracle memory configuration errors.
DLPX-62987	Allowed assigning privileges over replicated objects through the UI.
DLPX-71593	TIMEFLOW_REPAIR incorrectly skips a log because of "wrong database".

Bug number	Description
DLPX-71751	Added NFSv4 support on AIX for Oracle and SAP ASE.
DLPX-71736	Dynamically disable RPC services if NFSv3 is no longer in use.
DLPX-71772	Network DSP Test between versions 5.3 and (6.0.3, 6.0.4) is fixed.
DLPX-71513	Replicate non-data objects like delphix engine users, authorizations, roles, permissions, policies and DB config templates.
DLPX-71305	Unable to load dummy recovery database dump due to SAP ASE error 15728.
DLPX-71172	Enabling SAP ASE dump history causes IllegalStateException in getDumpListFromLastRestoreDateAndFiles due to timestamp mismatch because of TZ.
DLPX-71178	SAP ASE internal error raised when dump history file is purged using sp_dump_history.
DLPX-65101	Fixed a race condition between a DB_DELETE job and the Oracle retention policy worker for the same container that can lead to a deadlock between the job and the worker.
DLPX-71918	Fixed an issue that causes the Delphix Engine UUID to change upon rebooting in IBM Cloud.
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."
DLPX-71611	Updated UI time zone library to IANA 2020a.
DLPX-70349	Fixed a memory leak during incremental replication.

Bug number	Description
DLPX-72038	Fixed an issue that prevents 5.3.x - 6.0.x upgrade if a static route exists that goes over a DHCP interface.
DLPX-72148	Fixed a bug of always order hooks alphabetically rather than the running order set by users.
DLPX-71971	Allowed Enable/Disable of VDB if its current Timeflow has at least one snapshot.
DLPX-72115	Changed the Time Point field on a VDB back to reflecting the point on the parent the VDB was created from, but displayed in the timezone of the parent.
DLPX-71995	6.0.4.0 can no longer interact with 5.3.x remote Masking Engines.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-70675	Fixed a bug that causes the system to become unresponsive after expanding multiple storage devices.

### Release 6.0.4.2 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-72155	Fixed an issue that can render a Delphix Engine unbootable if a reboot occurs after upgrade verification but before the upgrade is applied.
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."

## Release 6.0.4.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-71930	Fix a bug that causes feature flags to be disabled when upgrading to 6.0.4.0.

## Release 6.0.4.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-68173	Resolved an issue where temporary database backup/ device files created for cleaning up the target database were not being deleted.
DLPX-68773	The management stack runs out of memory as the environment monitor does not purge stale objects.
DLPX-69573	Allow linking an Oracle PDB with a lowercase name.
DLPX-69634	Allow provisioning an Oracle PDB with a lowercase name.
DLPX-69962	After detaching a PDB, perform unplug/plug, and attach again, if disabled is performed before SnapSync, the PDB can no longer be enabled.
DLPX-66045	Prevent Self-Service Container branches getting into an unusable state by blocking deleting the last segment of branches.
DLPX-7037	Snapsync performs an unnecessary checkpoint.
DLPX-68277	Users will see the detailed error message upon connection failure to Delphix connector during OS user validation and there will also be a "More" button with an error message which will open an error popup with all error details.

Bug number	Description
DLPX-70288	On the "Add Environment" screen when OS user validation will get fail, they will see the "More" button along with the error message. When the user clicks the button, an error popup opens with all details of the error and suggested action.
DLPX-70832	NFSv4 support for appdata sources running on AIX.
DLPX-68495	Fixed GUI reporting conflict information when creating a Retention Policy.
DLPX-70788	Added Environment User field for MSSQL sources in Datasets -> Configuration -> Source tab -> Staging Environment section.
DLPX-58047	Fixed bug where the sort sequence was incorrect. Fixed in Hook Operation Templates.
DLPX-67931	Provision against VPDB after create/drop a new tablespace failed with exception.oracle.targetscripts.rename.datafiles.
DLPX-59910	Comps.xml associated with Oracle Homes are marked as unparseable if they are longer than 65535 characters.
DLPX-55476	CLI provisioning fails when the mount point provided includes quotes around the path.
DLPX-71168	Changed type to text and spaced "Secret Key" and "Username Key".
ORB-3285	Support using <a href="https://api.delphix.com">api.delphix.com</a> as a proxy for verifying the Cloud Agent binary's code signature certificate.
DLPX-71006	Allow provisioning across patch versions for Oracle versions on or after 18.X.
DLPX-71334	Migrate NTP configuration when upgrading between 5.3 and 6.0.

Bug number	Description
ORB-3286	Communication with Central management servers is now routed through the web proxy when one is configured for the Engine.
ORB-3117	Summary: Increase an action's failure message size to 256 characters so users can view large failure messages.

### Release 6.0.3.1 changes

#### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-71339	Fixed an issue that can cause the Virtualization Management service to become inaccessible when the system memory became highly fragmented.

### Release 6.0.3.0 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-63192	More details will be displayed in the error message in case DB_SYNC fail due to missing SELECT permission on database 'msdb'.
DLPX-67708	Removed unnecessary Source Continuity source-archive file system.
DLPX-66878	A meaningful error message will be displayed in case the user is missing 'VIEW ANY DEFINITION' and 'VIEW SERVER STATE' permissions on AG Instance and linking is performed.
DLPX-68668	Fixed the issue when Environment discovery fails with Internal Error when Oracle DB instance name is > 15 characters.

DLPX-68539	Added support for Read-Only Oracle homes.
DLPX-62027	Fixed a bug that causes factory reset to fail when there are provisioned VDBs.
DLPX-67830	Eliminated a virtualization management service crash caused by egregious use of memory by environment monitoring.
DLPX-69067	Enabled NFSv4 support for older RedHat NFS clients.
DLPX-68491	Fixed an issue when SCAN Listener is not discovered for Oracle 19c Cluster Environment.
DLPX-68931	Improved replication throughput by parallelizing data streams.
DLPX-69350	Fixed an issue where in some cases a VDB's Time Point would not appear.
DLPX-62602	Prevented a full snapsync after detecting an incarnation change of and reverting to a previous incarnation of an Oracle database.
DLPX-69579	Resolved the issue of intermittent failure of DB_SYNC for source database full backups containing in-memory tables which were caused due to improper merging of filestream folders.
DLPX-69104	Fixed an issue when Environment Monitor task monitors replicated entities could lead to Out of Memory.
DLPX-58561	Increased online Redo Log size when using VDB Provisioning defaults from 50mb to 1024mb.
DLPX-68831	Storage is removed even when the drop database fails, causing ASE error 823.
DLPX-68323	Linking will not fail in case a slash is used as the path delimiter on the source database.
DLPX-69561	Allowed NoLogging Diagnosis to be shown and edited for Oracle CDBs.

DLPX-69625	Fixed an issue that causes the CLI to hang when deleting an object.
DLPX-65357	Source Environment selection in Attach dSource dialog is now alphabetically sorted.
DLPX-65215	Fixed an issue where Hotfixes aren't listed until after management service restarts.
DLPX-57988	The increased timeout of doShutdownOracleInstance.sh script from 20 seconds to 10 minutes.
DLPX-70018	Resolved the issue where during validated sync, fault "fault.mssql.source.next.backup.missing" was caused due to backupsets with similar first and last lsn.
DLPX-66671	dSource selection in dSource Linking Wizard is now alphabetically sorted.
DLPX-65723	MSSQL server cluster address is now editable through the Environments GUI.
DLPX-69514	Gracefully handle accelerated networking on Azure.
DLPX-68942	Implemented retries with some time delay in case of a failure while switching database user mode.
DLPX-56626	Some orcl_log_info entries have a very large and incorrect end_scn (281474976710655).
DLPX-67579	Deleted users' actions should be included in the action/audit log API results.
DLPX-69863	Enhanced instruction text relating to SSH when editing environment users.
DLPX-70081	Removed excessive debug logging for DSP connections which results in fast rollover of debug logs.
DLPX-66203	CLI / API calls to refresh/rewind vCDB directly should be disallowed.

DLPX-67194	RHEL 7.6 connector log shows Unidentifiable version string: RedHatEnterpriseServer 7.6.
DLPX-66754	When VDB is disabled, environment configuration can now be edited in the UI.
DLPX-62095	A wrong certificate is identified as an issuer of a self-signed certificate in rare cases.
DLPX-69243	Do not require an issuer to be present or keep the full chain intact on Truststore operations.
DLPX-59331	Permit non-CA certs in user Truststore.
DLPX-60779	Changed error message when there are no compatible installations on provisioning.
DLPX-69518	Provisioning failures due to BitLocker encryption will be identified and a proper error message will be displayed.
DLPX-64797	Fixing memory leak in hk2 library.
DLPX-70039	Password vault migration nullifies ASE linked source dump credentials.
DLPX-70089	Protection against a variant of billion laughs attack (XML entity expansion).
DLPX-64207	Added API support to revert from static to DHCP DNS settings.
DLPX-68857	Faults reported for Oracle Home missing where the Central Inventory does not show this Oracle Home present.
DLPX-64435	Exclusively specifying 'required' parameters to discover Oracle cluster via CLI results in an exception.
DLPX-69604	Alerts & Faults are reported for hosts in a namespace that can cause Out of Memory issue.
DLPX-39882	Prevented cloning of Tiimeflow storage for Oracle source continuity.

DLPX-67425	Resolved an issue when validated sync (with full/diff) restored multiple backupsets and a restore failed with a SQL server transient issue after a source continuity reset event resulting in a state where no operations could be performed on the dSource.
DLPX-70433	"DLPX_EXECUTE_SQL_CLEANUP_RETRY" will also print nested SQL error messages in case of command failure.
DLPX-68582	Customers now have access to an API to display the Engine License information.
DLPX-61335	Displayed in confirmation dialog the name of the user being deleted.
DLPX-70639	Resolved output buffer issue while identifying BitLocker encryption during provisioning on Win19.
DLPX-66259	Updated messages on the upgrade page when the operation fails.
DLPX-70782	Bumped up connector version for NET 4x installer as shipped OpenJDK version had been upgraded.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-68995	Improved performance of dataset deletion.
DLPX-68997 DLPX-68999	Improved single connection replication throughput.
DLPX-70697 DLPX-70703	Addressed an issue that causes long periods of I/O unresponsiveness.
DLPX-69953	Fixed a bug that can cause a Windows iSCSI initiator to fail to connect to the Delphix Engine.
DLPX-70512	Fix a hang in the I/O subsystem that can cause the Delphix Engine to become unresponsive.

## Release 6.0.2.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-70065	Provisioning a VDB from a dSource or another VDB will fail if the following conditions are met: <ul style="list-style-type: none"> <li>• Delphix Engine has at least one dSource and a VDB created using a Python plugin prior to the upgrade</li> <li>• Delphix Engine was upgraded to 6.0.2</li> <li>• Provisioning was attempted from the UI after the completion of the upgrade</li> </ul>
DLPX-69350	Fixed an issue that the time point attribute of a VDB is not shown.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-69864	Fixed an issue that causes MSSQL operations to hang after the reception of an iSCSI LUN reset.

## Release 6.0.2.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-62806	Fixed an issue where provision against PDB after unplug/replug against the same linked PDB fails with exception.oracle.targetscripts.controlfile.create.
DLPX-67567	Oracle Source Continuity creates an unnecessary source-archive file system on zfs.
DLPX-27807	LogSync may fall behind when connected to an Oracle physical standby database in Real-Time Apply mode.
DLPX-68385	Customer provided Oracle Java missing in the search path for Java on hosts.

Bug number	Description
DLPX-62782	Reducing the number of nodes for RAC VDB and VDB in NOARCHIVELOG mode may result in ORA-00258 errors during VDB enable operation.
DLPX-62738	Better error message when plugins are uploaded out of sequence.
DLPX-68722	The product now recognizes VMware with BIOS date of 12/12/2018 as VMware 6.7.0u2.
DLPX-68579	SnapSync of Oracle 19c DB with encrypted tablespace fails with fatal exception "Block header 91 is not empty".
DLPX-68689	Fixed the issue where a huge number of error messages from ASE caused OutOfMemory Error.
DLPX-68957	Always On AG discovery will not fail in a multi-subnet environment.
DLPX-63088	Can now recover multiple Self-Service containers at the same time.
DLPX-47977	Improved handling of snapshot standby.
DLPX-64125	SnapSync failed with exception.oracle.dsource.sync.no_hosts.rac on RAC clusters with very long hostnames.
DLPX-62584	PDB enable failed after migration if mountBase has a trailing slash.
DLPX-68657	Virtualization can now fetch jobs from Masking engines configured with HTTP redirection.
DLPX-69121	It is no longer mandatory to have at least one enabled system administrator with local credentials.
DLPX-68167	Fixed an issue where too many requests were being sent for Faults from the Datasets pages.

Bug number	Description
DLPX-69082	Large stderr produced by failed rsync jobs are truncated to prevent Java OutOfMemory errors.
DLPX-58600	Datasets filter updated so that all items within a group that matches the filter string are displayed, even if the items contained in the group do not match the filter string.
DLPX-65896	VDB deletion failed due to the inability to delete LogSync worker.
DLPX-57903	Improved diagnosability of PDB discovery issues.
DLPX-68878	Fixed issue where start/stop buttons were not being displayed in the RAC instances configuration table.
DLPX-69271	Enabled replication smart failover by default.
DLPX-66715	The user-visible name for Oracle cluster objects is being replaced with the Oracle cluster name. For Windows clusters, the user-visible name is being replaced with the cluster address.
DLPX-68929	Changed default replication settings for better out of the box performance.
DLPX-68930	Improved replication throughput when sending multiple timeflows.
DLPX-69245	Fixed a memory leak that occurs when experiencing connectivity errors.
DLPX-69377	At least one non LDAP system user should be enabled when the LDAP server is being disabled.
DLPX-68575	LDAP principal fields were not being redacted in phone-home bundles.
DLPX-68528	Self Service Recover operation failed due to missing Timeflow.

## Fixes that take effect after an optional reboot

Bug number	Description
DLPX-66808	Re-introduced console splash screen with IP address and service states.

## Release 6.0.1.1 changes

### Fixes that take effect after an optional reboot (Optional on Reboot)

Bug number	Description
DLPX-69203	Improved synchronous write performance over iSCSI.
DLPX-69167	Improved SQL Server data ingestion performance by leveraging asynchronous writes on underlying storage.
DLPX-69298	Eliminated possible data corruption on SQL server and vFiles over iSCSI that can occur when a Delphix Engine reboots.

## Release 6.0.1.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-60689	For SAP ASE, instead of using the DBCC CHECKALLOC command to fix DBID mismatch issue, the MOUNT command with FIXDBID and ALLOW_DBID_MISMATCH clauses will be used, to improve performance.
DLPX-65831	VDB snapshots need to clean unneeded ZFS datafiles.
DLPX-63949	Improved boot time after 5.3 to 6.0 migration by optimizing metadata indexing.
DLPX-66261	Upgrades to 6.0.0.0 will only be supported from a release greater than or equal to 5.3.6.0.

Bug number	Description
DLPX-66486	Snapshot of a linked database can end up with extra datafiles that do not belong to the database which might cause VDB on VDB provision to fail during rename of datafiles.
DLPX-66558	Cluster environment discovery was incomplete if the host locale was not English.
DLPX-66804	DB_LINK using incorrect user when RAC node also configured as a standalone environment.
DLPX-66768	vPDB save state lead to rollback or child provisioning failures.
DLPX-66823	Unable to link database with CL8MSWIN1251 charset.
DLPX-64538	Fixed a bug causing the timezone selector to only be visible when manually setting the time.
DLPX-66809	Removed the Windows Diagnostics Files and Directories on successful Diagnostics upload.
DLPX-67279	Provision failed when the source was from a RAC Oracle Standard Edition database and the target was Oracle Standard Edition.
DLPX-67451	Fixed an issue that sporadically caused replication to fail with an internal error.
DLPX-67454	Delphix Engine should select the highest version ojdbc driver available at ORACLE_HOME/ojdbc/lib.
DLPX-66077	Ensures child worker threads are gracefully exited when parent linked source sync job has completed/terminated.
DLPX-45983	MSSQL Validated sync will resume when storage usage falls below the threshold if storage threshold enforcement failed in the past.

Bug number	Description
DLPX-67560	Fixed an issue where MT provision may result in ORA-02058 due to un-purged or inflight 2PC transactions on dSource.
DLPX-67594	Old timeflows and snapshots are not getting removed by snapshot retention.
LX-2020	Report the correct amount of memory allocated to EC2 Nitro instances.
DLPX-67413	Fixed an issue where VDB point in time provisioning might fail if Oracle database environment is configured in a non-English locale.
DLPX-67684	PDB provisioning failed if the source had shutdown triggers.
DLPX-67575	Fixed failure during point in time 'Virtual to Physical' provisioning.
DLPX-67668	After setting the database online give it some extra time to startup completely, before doing any further operation on it.
DLPX-67759	Redact sensitive information from phone-home data.
DLPX-64638	Validated sync stops working if Delphix cannot connect to the backup server.
DLPX-65559	Even when the staging instance is down, attempt counter to detect backup files keeps on increasing and eventually, it stops detecting backups.
DLPX-56537	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.

Bug number	Description
DLPX-67894	Removing cluster resource without removing its dependency can result in cluster failure. So, added retryer logic while fetching the resource dependencies (Get-ClusterResourceDependency) and ultimately fail the operation after all the retries.
DLPX-67813	Unsupported SQL server backup type gets picked while validated sync and the operation fails while looking for the backup. So, introduced a tunable filter to automatically skip SQL backups taken by backup software not supported by yet Delphix.
DLPX-67925	Added env host connectivity toolkit support for SLES on Power9.
DLPX-67934	Retries to fetch image identifiers during Netbackup restore if there is a mismatch between MSDB and Netbackup Master.
DLPX-67655	Fixed an issue where retention enforcement can generate user-visible errors while attempting to delete snapshots with dependencies after PDB migration to new CDB.
LX-1944	EBS NVMe devices can now be used in Delphix Engines.
DLPX-68022	Fixed an issue where hostchecker 'Check Oracle DB Instance' fails on HPUX and AIX.
DLPX-68124	PDBs with lower/mixed case names will not enable after an upgrade.
DLPX-68126	Fixed a bug that limits the number of disks that can be added in GCP.
DLPX-67421	Update the primary db file names in a transaction with the Timeflow creation to make sure whenever a Timeflow is created successfully we have its primary file information.

Bug number	Description
DLPX-67440	Skip VDBs having its current Timeflow as null from 'PrimaryDbFileAvailabilityCheck' as these VDBs doesn't undergo queisceing and are recoverable by refreshing them.
DLPX-61818	Linking wizard - Target Environment step - Privileged Credentials authenticates on the selected target now.
DLPX-68117	Some non-Admin users, lack all permissions, are unable to login to upgraded engine.
DLPX-67290	A wrong version input by user while manually adding a SQL Server instance, created issues in provisioning VDBs. SQL Server version will now be auto-discovered for manually added instances on adding or refreshing the environment.
DLPX-66238	Updated error message to let know user that non discovered CDBs are filtered out from the list when linking a detached source.
DLPX-68457	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-68484	Fixed the issue where 'lstart' column value of sysusages table was beyond the range of Integer data type by taking the Long data type to store the lstart value.
DLPX-68500	Fixed an issue where the NTP service is not started following a reboot.
DLPX-68290	Support bundle generation can be time-consuming if the engine has a large number of snapshots to process.
DLPX-67792	Fixed issue in grids in which the selection checkbox was unclickable.

Bug number	Description
DLPX-67555	Provision vPDB/vCDB fails with ORA-45900 if the parameter <code>enable_pluggable_database</code> is omitted when specifying database parameters for new vCDB.

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-67782	Engines running 5.3 on EC2 i3 can now be migrated to 6.0.
DLPX-67961	Fixed an issue that prevents ssh access after switching to a static IP address.
DLPX-65948	Fixed a bug that could cause replication jobs to fail with internal errors
DLPX-68025	Improved boot time after 5.3 to 6.0 upgrade by reducing the overhead of setting ZFS properties.
DLPX-67868	Fixed a bug that can cause the management service to run out of memory when disabling the Splunk integration.

### Release 6.0.0.0 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-27433	The analytics GUI network graph shows newly added NIC information without requiring a management service restart.
DLPX-33998	If you add a hook script via the CLI, newlines are removed erroneously.
DLPX-40094	Correctly set the default type for the parameters to all operations in the CLI according to the container type.

Bug number	Description
DLPX-43215	Exclude sybsecurity from the list of auto-discovered databases.
DLPX-48712	Java 6 packages are no longer included in the product image.
DLPX-48280	When a user is set with the Provisioner role the 'provision' button does not appear, meaning anyone set with this role only is unable to provision VDBs.
DLPX-53996	The Delphix Engine does not provide instructions to browsers to avoid caching HTTP responses (pages).
DLPX-54740	Ensure Windows mount points are always unmounted as part VDB refreshes to prevent future VDB refreshes from failing due to "ERROR_ASSIGN_MOUNTPATH: failed to assign mount path for disk at="">, error="">,>
DLPX-55282	In environments where the vPDB has been provisioned using a Delphix provisioned virtual CDB, shutting down the virtual PDB causes it to get into an incorrect "Cannot monitor" state, this has now been fixed to show the correct "Stopped" state.
DLPX-55598	Fixed an issue where vPDB refresh/rollback triggers spurious vCDB restart jobs, after vPDB+vCDB auto-restart.
DLPX-55829	Validated Sync can fail when monitoring ASE backup servers started by using the \$DSLSTEN environment variable instead of the "-S" argument. This can be worked around by accessing \$DSLSTEN in the RUN_xxxxx script and pass it down as -S.
DLPX-55958	VDBs with no snapshots failed to re-enable after a Delphix Engine upgrade, this has now been fixed.
DLPX-57454	Display underlying ssh error when environment host connections fail.

Bug number	Description
DLPX-58519	Enable Oracle LiveSource when LiveSource is in RESYNC_NEEDED state currently re-start Oracle Redo Apply. Oracle Redo Apply should not be restarted in this state.
DLPX-58760	Fixed a TCP port leak in the network throughput test feature.
DLPX-58845	Provisioning vFiles to the same host using different OS Environment Users no longer fails.
DLPX-59772	The API to list all snapshots consumes a significant amount of memory when there are more than 100,000 snapshots on the engine.
DLPX-60356	Fixed an issue where Oracle remote listener registration fails if set to empty string.
DLPX-60603	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-60907	Fixed an issue where the Environment Monitor on Redhat 6.9 and 6.10 might throw unidentified version errors.
DLPX-60979	When user configures connection strings manually, these connect strings can end up connecting to incorrect PDBs/CDBs causing invalid snapshots. Verify that each connection to a PDB/CDB connects to the expected PDB/CDB.
DLPX-60993	Delphix backups create controlfile records; in rare circumstances, these records can cause invalid snapshots. To avoid this problem, remove Delphix backups control file records when using SCN-based SnapSyncs once a SnapSync completes successfully.
DLPX-62094	Allow certificates to expire after issuer certificate expiration.
DLPX-62241	Reduce SSH connections by temporarily preserving and reusing existing Delphix<->host connections where possible.

<b>Bug number</b>	<b>Description</b>
DLPX-62781	Spurious job event "DISCOVERED_TO_MANUAL_ORACLE_CLUSTER_NODES" no longer shows up for non-Oracle RAC environment refreshes.
DLPX-62892	In Oracle versions 18c and 19c, an Oracle bug can prevent the datafile headers from being updated for a standby database when managed recovery is running, resulting in failed SnapSync operations. Alert the user that an Oracle patch might be needed.
DLPX-62962	Removed unneeded EMPTY_RENEGOTIATION cipher
DLPX-62998	Fixed an issue where stale file mounts may be leftover when vPDB provision fails.
DLPX-63469	Initial setup now fails if the system was not provisioned with enough storage.
DLPX-63600	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-64641	Fixed an issue where the last snapshot of a vPDB Timeflow can be deleted after the vPDB has been disabled, thus leaving the vPDB in a state with no provisionable snapshots.
DLPX-64711	Allow provisioning to complete when source CDB includes PDBs in a broken state.
DLPX-66020	Provision should remove files present in datafile filesystem that are not part of the database when provisioning a VDB from a VDB.
DLPX-67299	ASE environment discovery will not fail if there is a mismatch of "dataserver name argument" and value of "@@servername".
<b>Bug number</b>	<b>Description</b>
DLPX-67753	Fixed an issue causing redirect responses to reveal server type and version when HTTP redirection is enabled.

Bug number	Description
DLPX-72068	Improved the way volumes are fetched while working on mounts.
DLPX-74396	Fixed an issue that occurred when manually adding a database to an environment which has the same unique name as a database in another environment managed by the same Delphix engine. Previously, Delphix reported an incorrect environment containing the same unique name.
DLPX-80172	Updated the Self-Service refresh warning message.
DLPX-80271	changeArchivelogMode now has an associated job event.
DLPX-80387	Fixed an issue where Oracle move-to-asm script would fail while dropping temp due to tempfiles being in use and unable to be dropped after the database was started.
DLPX-81184	For S3 object store, the "Base URL" input is renamed to "endpoint". The "region" input is now a dropdown for the user to select from a list of standard regions. The endpoint corresponding to that region will now be auto-populated.
DLPX-81692	Fixed an issue where Direct NFS was not being detected for Oracle 21.
DLPX-81996	Fixed an issue where an environment refresh after upgrade did not remove outdated/obsoleted toolkit components in 6.0.014.0 and 6.0.15.0.
DLPX-82075	Fixed an issue that prevented the creation of a network route whose gateway is reachable through multiple interfaces.
DLPX-82112	Added checks to prevent using NFSv4 with Direct NFS for some Oracle 19 versions that don't support v4 due to an Oracle bug.

Bug number	Description
DLPX-82236	Fixed an issue where Speculative Logging was being called out of context and could lead to unbounded consumption of rpool.
DLPX-82308	Fixed an issue where the provision/refresh of an Oracle Key Vault vPDB fails with, "ORA-28365: wallet is not open".
DLPX-82329	Action-based alerts now include the success or failure state of the action, including the reason in case of failure.
DLPX-82334	Enabled the creation of on-link network routes; routes whose destination are directly reachable without a gateway.
DLPX-82381	Improved Replication performance on engines with a lot of objects.
DLPX-82392	Fixed an issue where after editing credential environment variables, the create/provision VDB wizard would fail because the environment variables were missing the password field in the payload. The required password field has now been added.

## Release 6.0.15.0 changes

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-80760	Increased the inotify limit to address a defect during upgrade.

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-68240	Fixed an issue where LogSync for an Oracle RAC standby does not set max number of backup tasks correctly.

Bug number	Description
DLPX-73375	Added granularity in restore job events to mark various phases of Restore Backup process. Added events in Restore Backup job to provide information at the start of the Redo phase of a restore command.
DLPX-75677	Fixed an issue causing auto population of the encryption key when no input is given.
DLPX-78913	Fixed a minor typing issue when deleting a MSSQL database.
DLPX-79228	Fixed a VDB Start Fault after a VDB start job is successful.
DLPX-79528	Made improvements in environment monitoring to return the NO_DELPHIX_DATABASE status for Staging Push dSources when they are not managed by Delphix, and avoids monitoring other attributes for such databases.
DLPX-79596	Made a change in the enable flow for Staging Push dSources to always make an attempt at unmounting the DATA storage before dropping the staging database.
DLPX-79780	Mount with local_lock=all on Linux, when mounting VDBs with NFSv3.
DLPX-79999	Use the offset in the time_zone column of msdb.dbo.backupset to convert the timestamp correctly for a backup from a source, and then continue using the staging host timezone to display the time of a snapshot on the UI.
DLPX-80206	Updated MD5 checksums for Oracle 12.1.0.2.0 OJDBC jars.
DLPX-80254	Fixed an issue where Oracle JDBC jar checksum checks are being reported as false positives despite underlying database connection issues.

Bug number	Description
DLPX-80406	The Spring framework has been updated due to the Spring4Shell vulnerability.
DLPX-80487	Fixed an issue where the Delphix UI would sometimes not render, showing waiting for response.
DLPX-80494	Added an action item to check for support Host and Server Type combination while adding MSSQL environments.
DLPX-80619	This change will introduce the ability to add sporadic failures via tunable: ADDITIONAL_SPORADIC_FAILURES.
DLPX-80909	Cross-Site Scripting (Reflected) in /resources/json/delphix/session.
DLPX-81048	Removed the requirement for Linux kernel recover-lost-locks setting when using NFSv4 with Oracle dNFS.
DLPX-81090	Can now enable/disable SNMPv3 vs. v1/v2.
DLPX-81100	Updated the command for checking database files accessibility while fetching the VDBs status with a lighter and less intrusive command, to get relief from VDBs being stopped randomly.
DLPX-81242	Fixed an issue preventing the upgrade of a replication Continuous Vault source with automatic replication.
DLPX-81308	Fixed an issue causing Appdata SnapSync to crash with NullPointerException when a virtual database is not successfully refreshed or rolled back.
DLPX-81358	Fixed the unnecessary alerts of timezone discovery failure that users were facing randomly for the cluster environments.
DLPX-81502	Improved performance of the Replication page.
DLPX-81696	Users should now be able to enable the feature flag AZURE_DATA_BANK.

Bug number	Description
DLPX-81710	Fixed an issue where an engine could not be setup when objectStorage is enabled.

## Release 6.0.14.0 changes

### Security fixes

Bug number	Bug Introduced in	Description	Security Bulletin
DLPX-81059	5.2.2.0	Arbitrary Code Execution may be performed when configuring masking environments	<a href="#">TB098</a>

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-38908	Oracle LogSync should automatically resolve faults for transient issues
DLPX-39193	Null Pointer Exception in Oracle LogSync backup stream handler
DLPX-57078	Job cancel requests during Oracle provisioning are not processed until the end of recovery
DLPX-57405	move-to-asm.sh does not support TDE-enabled databases
DLPX-62343	disable the OPTIONS method for all HTTP(S) requests
DLPX-64386	Oracle LogSync thread may hang when trying to remove temporary RMAN command file from source host toolkit directory
DLPX-65413	Ensure "source-archive" directory is unmounted at start of Oracle Provision

Bug number	Description
DLPX-66879	Oracle LogSync can create orphaned logs in certain scenarios
DLPX-69453	Provide tunable for Oracle LogSync client timeout
DLPX-69802	Common Toolkit directory is not removed from a mounted shared NFS location when the environment is deleted
DLPX-76382	Force disable should succeed despite environmental problems
DLPX-77840	Fixed an issue on the Setup pane to allow successful completion of an smtp test against a specific email address
DLPX-78412	SCM/Talaria failure reason should be communicated in the Delphix fault warnings
DLPX-78726	Removing windows environment performs cleanup of iSCSI persistent login target
DLPX-78754	Disable operation is prohibited on replicated sources
DLPX-78986	Prevent DSP connections for disabled Oracle RAC cluster nodes
DLPX-79077	Resolved an issue of an infinite spinner when validating BEQ credentials for Oracle dSource with duplicate unique_name. While linking a dSource, credentials are now required when discovering an unknown CDB.
DLPX-79242	Splunk HEC token logged to debug logs during splunkHec test
DLPX-79396	Allow users to unset Oracle database user name and credentials through CLI if Simplified Connection Management is enabled.
DLPX-79502	SnapSync fails if more than 1000 tempfiles exist in the whole CDB

Bug number	Description
DLPX-79591	Changed the NFSv4 minimum supported target Redhat version to 6.4 (was previously 6.3).
DLPX-79742	Unable to provision PostgreSQL VDB to Linux host with processor type of ppc64le
DLPX-79823	Improved the action item for failure to enable/attach the staging push dSource.
DLPX-79942	Improved the action item for failure to enable/attach the staging push dSource.
DLPX-80137	Limit SNMP configuration access to sysadmin
DLPX-80144	Oracle SnapSync crashes with NullPointerException when a PDB dSource is renamed and replaced with a new PDB of the same name
DLPX-80217	Fixed issue with filename conflicts during source backup restore
DLPX-80302	It was necessary to restart the auxiliary CDB during a TDE provision after recreating the autologin keystore
DLPX-80369	Oracle environment monitor triggers fault.oracle.db.connection.failed fault immediately on dataset stop or disable.
DLPX-80415	Fixes long delay in operations such as VDB start/stop when JDBC Thin connection to database fails due to unable to establish network connection.
DLPX-80439	Provide mount location to upgrade scripts during Lua to Python upgrade process if mount specification has not been provided.
DLPX-80440	Fixed spinner issue while provisioning a VDB from a SQL Server staging dSource from Provision VDB option in datasets menu

Bug number	Description
DLPX-80482	TDE-enabled provisions to a RAC target fail with "ORA-28365: wallet is not open" while attempting to reopen the database in start_database.sh in the auxiliary
DLPX-80483	Fix failing TDE-enabled vPDB provisions to a linked RAC container database due to "ORA-28365: wallet is not open" errors
DLPX-80487	Improved performance across dataset and replication related pages.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-80078	The issue with removing files with complex file permissions on EBS is now fixed

### Release 6.0.13.1 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-80818	libc upgrade necessitates PostgreSQL re-index.

### Release 6.0.13.0 changes

#### Security Fixes

Bug number	Bug Introduced in	Description	Security Bulletin
DLPX-79789	5.3.0.0	Arbitrary Code Execution May Be Performed by Engine System Administrators.	<a href="#">TB096</a>

## Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-7868	The issue with the confusing vPDB error on a snapshot after resetlogs of a linked CDB is now fixed.
DLPX-41671	You can now update the Oracle cluster home through the user interface.
DLPX-43467	When dSource is an Oracle standby in RTA mode, LogSync was raising the <code>fault.oracle.linkedsouce.log.conflict</code> error and getting disabled on its own. This issue is now fixed.
DLPX-50309	Users can now change <code>logSyncInterval</code> for Oracle dsources.
DLPX-59757	The count for masking jobs fetched from the Masking Engine is now configurable. By default, it is set to 500.
DLPX-67604	The manual recovery of a database after V2P from a snapshot of dSource was failing with an error. This issue is now fixed.
DLPX-68684	The self-signed certificate is now compliant with the requirements for trusted certificates in MacOS 10.15.
DLPX-74613	Oracle VDB migration check needs to be done against the Oracle target host instead of the source. Furthermore, the Error and Action plan provided should include the target hostname.
DLPX-75467	The CLI now returns correct and descriptive error messages when executing unauthorized requests on uninitialized engines.
DLPX-75646	To diagnose BEQ connection failure, this release adds MD5 checksums for <code>ojdbc*.jar</code> for Oracle release versions up to currently supported release version.
DLPX-75878	The issue with the JDBC connection string for an Oracle vPDB not getting updated after an IP address change is now fixed.

Bug number	Description
DLPX-75989	The issue with the failure of environment discovery of an Oracle Cluster with a NullPointerException error is now fixed.
DLPX-76956	Previously, the Oracle JDBC test connection with the wrong password was increasing the <code>LCOUNT</code> value by more than 1. This issue is now fixed.
DLPX-77140	This release now speeds up metadata that is sent during replication when Extended retention is involved.
DLPX-77231	Previously, when source discontinuity on the dSource was followed by resync on the livesource, one or more livesource workers were failing to start. This prevented livesource status from getting updated and the first snapshot from being taken after resync. This issue is now fixed.
DLPX-77600	This release fixes NPE when Linking dSource with missing backup and unreachable nodes.
DLPX-77880	This release improves scalability for engines with an extremely large number of snapshots that were causing them to run out of memory.
DLPX-78015	Previously, V2P export with absolute data files was failing with an internal error. This issue is now fixed.
DLPX-78174	Insecure DES is no longer supported for SNMPv3.
DLPX-78420	This release adds V2P support for Windows server 2022 host machines.
DLPX-78473	This release improves load times for Datasets and Dataset Performance pages for engines with a large number of datasets and containers.
DLPX-78488	Previously, when switching from the backup server to ASE, dump history was not working for dSources configured to use the remote backup server. This issue is now fixed.

Bug number	Description
DLPX-78594	This release fixes an issue with disabled VDBs not being able to undo a refresh.
DLPX-78688	TLS 1.0 and TLS 1.1 ciphers are no longer available. Any system that is only configured with TLS 1.0 or TLS 1.1 ciphers is switched to use the default cipher set.
DLPX-78693	Invalid sync parameters will not cause DE server unavailability.
DLPX-78696	Switching sync strategy from source sync strategy type to sourceless strategy type is not allowed.
DLPX-79126	VDBs can now be automatically started with the tunables if stopped intermittently because Windows fail to write on the mount (Msg 9001).
DLPX-79292	This release eases restrictions on taking a snapshot of PDBs with encrypted UNDO tablespaces.
DLPX-79344	Previously, Snapsync of a standby PDB in mount mode was failing with the <code>ORA-01109: database not open</code> error message. This issue is now fixed.
DLPX-79422	Previously, clicking on a Replication Profile was resulting in the following error message <code>An error happened while communicating with the server</code> . This issue is now fixed.
DLPX-79789	Under certain conditions, arbitrary code execution may be performed by sysadmins.
DLPX-79808	This release fixes failures if the VDB name is more than 68 characters.

## Release 6.0.12.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-79151	The issue with remote syslog configurations preventing engine upgrades or virtualization service restarts is now fixed.

## Release 6.0.12.0 changes

### Log4j Updates

Based on detailed testing and analysis, all the currently supported products are not susceptible to known log4j vulnerabilities. Please refer to [TB095 Technical Bulletin](#) for more information. All instances of log4j in currently supported Delphix products are updated to **log4j 2.17.1** as of this release.

Delphix keeps you updated on the latest developments and keeps releasing hotfixes, procedures, and workarounds for such critical vulnerabilities. For more information on how Delphix supports our product and customers in such cases, see [Delphix Product Security](#)

For more information, refer to the following pages:

- [TB095 log4j vulnerabilities](#)
- [Uninstalling the delphix connector service from the target database servers](#)
- [Delphix product lifecycle policies](#)
- [Product security](#)

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-23068	Validation for target database parameter 'DB_FILES' for single-tenant databases for the following operations: provisioning, refresh, rewind, and converting a dSource to LiveSource is now added. Furthermore, specific error messages for handling ORA-00059 errors are added.
DLPX-44544	The issue with the SnapSync of an Oracle standby dSource in Real-Time Apply mode calculating the snapshot's timestamp incorrectly is now fixed. This issue was resulting in ORA-01194 or ORA-01152 errors when provisioning to a timestamp after the snapshot.

Bug number	Description
DLPX-56691	The issue with the data files of a VDB getting unmounted when provisioning, refresh, or rollback job is canceled manually is now fixed.
DLPX-57971	The issue with the latest snapshot of a LiveSource taking a long time to show the SCN/timestamp range on its card in the GUI is now fixed.
DLPX-60320	UI now allows the selection of older dataset repositories (downgrade) in addition to selecting newer ones (upgrade).
DLPX-67069	The issue with the stopped Oracle VDB monitoring by the environment monitor that resulted in connection errors flooding the debug log is now fixed.
DLPX-68132	The issue with the “Copy query to clipboard” SQL copy functionality in the “Managed Source Data” is now fixed to have correct apostrophe characters.
DLPX-72123	The issue with the failure of detaching or deleting an Oracle dSource operation on RAC environments (This issue was occurring due to failure of deletion of RMAN backups on RAC and the operation needs to be retried with a force option) is now fixed.
DLPX-72779	The UI showing enabled or disabled for cluster nodes now uses a grid table. The Enabled column contains a checkmark to show whether the cluster is enabled or disabled. Users are able to select or unselect the checkmark to enable or disable a cluster.
DLPX-73975	Critical storage faults should not be ignorable nor manually resolvable
DLPX-74862	This release fixes an issue where the RESUME operation failed without any error thrown to the user on dSources where ENFORCE was still in progress. The fix will make sure that even if RESUME fails, it throws a DUE to the user with suggested actions to resolve the issue.

Bug number	Description
DLPX-75763	The issue with the failure of refreshing a VDB provisioned as an empty vfiles since there is no parent container to refresh from is now fixed.
DLPX-76266	The issue with the VDB Disable operation that resulted in an error message while connectivity with the host machine can't be established is now fixed.
DLPX-77123	You can now run Upgrade Verify when another upgrade is in progress.
DLPX-77347	This release fixes the difference in time shown for MSSQL snapshot based on different database authentication methods.
DLPX-77638	The issue with the failure of the End Entity Certificate expiration fault is now fixed.
DLPX-77664	The issue with the failure of the Oracle SnapSync with an error message, "RMAN-06183: datafile or datafile copy (file number ) larger than MAXSETSIZE" if a datafile resized in the middle of SnapSync is now fixed.
DLPX-77913	The issue with the faults table missing data if there was more than one page of faults is now fixed.
DLPX-77925	The issue with the unsupported Windows release error message is now fixed.
DLPX-78113	MSSQL VDB database size will now be refreshed periodically based on environment_monitor.dynamic_attributes_check_period tunable.
DLPX-78183	The issue with the MSSQL validated sync schedule not getting updated without successful backup restoration is now fixed.
DLPX-78244	The issue with the failure of a few operations on self-service containers due to incorrect entries corresponding to the Oracle log metadata on the Delphix engine is now fixed.

Bug number	Description
DLPX-78258	The issue with the input bug that retained cleared out DB credentials in the dSource linking wizard is now fixed.
DLPX-78263	The issue with the failure of a SnapSync of an Oracle standby dSource in Real-Time Apply mode with an error message, "exception.oracle.snل.linkedsource.current_scn.invalid" if the rate of change in the database is low is now fixed.
DLPX-78265	Offline Oracle bystander PDBs data files can now be optimized leading to improved provision performance.
DLPX-78309	The issue with the CLI being unable to log in to system users when the main virtualization service is down is now fixed.
DLPX-78334	The issue with a large number of missing Oracle archive logs causing an error while viewing dataset is now fixed.
DLPX-78392	Hosts running Windows Server 2022 can now be added as Source and Target environments to the Delphix Engine.
DLPX-78522	SSLv3, TLS 1.0, and TLS 1.1 are no longer configurations options for HTTPS. Any system configured only with these removed options will be automatically set to use TLS 1.2.
DLPX-78791	This release upgrades log4j from 1.2.17 to the latest 2.x in Windows Connector.
DLPX-78938	This release upgrades log4j in virtualization to 2.17.1.

## Release 6.0.11.0 changes

### Security Fixes

Bug number	Bug Introduced in	Description	Security Bulletin
DLPX-77921	6.0.8.0	Arbitrary Code Execution by Delphix System Administrators may be Performed on Virtualization and Masking Engines	<a href="#">TB094</a>

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-53019	The issue with the missing redo alert raised during the environment monitor check has now been resolved.
DLPX-59299	Discovery and monitoring rely on "Connected" in sqlplus output, which may not be the case if NLS_LANG is set to another language (e.g. Japanese). Downstream operations, like linking or provisioning, may then fail due to missing user privileges.
DLPX-59662	The issue with copy-Only Backups failure with Virtual Service Accounts has now been resolved.
DLPX-62706	The issue with the Hostchecker not properly checking /home/delphix permissions has now been resolved.
DLPX-64082	The issue with Oracle Provisioning scripts having hard-coded timeout issues has now been resolved.
DLPX-65729	Added retry functionality to the 'read backup files' operation during a validated sync to an account for an unstable environment.
DLPX-69778	SAML response is not logged on successful SSO login.

Bug number	Description
DLPX-72043	The issue where LiteSpeed <code>xp_restore_headeronly</code> stored procedure failure message are displayed when validated sync is active for dSources with LiteSpeed backup has now been resolved.
DLPX-72220	A UI issue that occurred while updating the vault when only the private key is changed has now been resolved.
DLPX-72225	Admin user created from management UI is no longer showing as 'non-admin' type.
DLPX-72237	The 'Verify Credentials' button from the DSP Throughput test page is now removed.
DLPX-72369	The dependency on a parent snapshot relying on the latest snapshot is now removed if a parent snapshot does not exist during the VDB enable operation.
DLPX-72778	Oracle dSource attach operation with changed DB ID using 'Force' option is now allowed.
DLPX-74555	Updated the "no Delphix connector" message while provisioning a Windows source environment.
DLPX-74676	Oracle LiveSource LogSync should only catalog valid archive log files.
DLPX-74851	In the Add Environment GUI, the mouseover information for "Set Delphix Session Protocol Options (DSP)" has been currentted.
DLPX-74896	The race condition issue when running Oracle VDB refresh and dSource snap sync resulting in incorrect MDS entry for the parent snapshot of a VDB in the <code>dlpx_timeflow</code> table has now been resolved.
DLPX-75335	Added a product name and product version for the Delphix Connector executable so this information can be available before installation.

Bug number	Description
DLPX-75500	For ag cluster nodes, if the refresh fails due to timezone discovery failure, don't delete the nodes from MDS as it doesn't mean we had an issue with the nodes.
DLPX-75952	Database configs will be replicated only if the associated VDB is replicated.
DLPX-75995	The issue causing environment 'Add' or 'Refresh' to fail when PowerShell Transcription is enabled has now been resolved.
DLPX-76244	The issue where TCP fallback connection to database stops responding if the Oracle database instance is down has now been resolved.
DLPX-76290	Databases of UNKNOWN cdb type are now included in the attachment of a non-PDB container.
DLPX-76731	Added Delphix support for <code>WALLET_ROOT</code> and <code>TDE_CONFIGURATION</code> parameters to manage wallets in 19c instead of sqlnet.ora.
DLPX-76759	Added "Response" to faults along with other details when logged in the Admin App.
DLPX-76777	Remove orphaned Oracle logs resulting from archive log fetch timeouts.
DLPX-76793	Added execution timeout for execution of <code>UpdateFileACL.ps1</code> .
DLPX-76974	The issue where a user was unable to change 'from address' of SMTP server to <a href="mailto:noreply@delphix.com">noreply@delphix.com</a> in the GUI has now been resolved.
DLPX-77112	The issue where an Oracle VDB cannot be provisioned between different minor versions if the Source is on higher RU has now been resolved.

Bug number	Description
DLPX-77284	The issue where after a hotfix was removed due to a successful upgrade, the system would still indicate the hotfix was installed post-upgrade has now been resolved.
DLPX-77345	The issue where provisioning a vVDB fails with <code>java.lang.OutOfMemoryError</code> when sqlplus is used to rename the datafiles has now been resolved.
DLPX-77405	Replicated password vaults will no longer be visible in the UI.
DLPX-77676	The issue where provisioning a vPDB from a PDB dSource fails with "ORA-65114: space usage in container is too high" if PDB <code>max_size/</code> <code>max_pdb_storage</code> is configured has now been resolved.
DLPX-77708	The issue where a refresh/disable/destroy of a VDB using NFSv3 could cause loss of access to other VDBs that were using NFSv3 has now been resolved.
DLPX-77844	The issue where V2P operations from a VDB snapshot would result in the deletion of any production datafiles that exist on specified V2P target directory has now been resolved.
DLPX-77904	Removed 'Factory Reset' for Delphix Engines that are Data Vaults, as the operation is disabled for those engines.
DLPX-77912	The issue that can cause a VDB stop, refresh, or rollback to fail with an internal error has been resolved.
ORB-2465	Removed the requirement that SAML SSO email addresses must match case-sensitively for SSO logins.

## Fixes that take effect after an optional reboot

Bug number	Description
DLPX-77577	Increased nvme I/O timeout to prevent storage issues in EC2 (Activated after optional Reboot).

## Release 6.0.10.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-77467	Loading the setup app dashboard (as sysadmin) was rendering a server error popup with instruction to contact Delphix Support. This 6.0.10.0 error has been known to impair the ability to configure web proxy, PhoneHome, SMTP servers, and other connectivity settings via the GUI. It has now been resolved.

## Release 6.0.10.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-18438	The issue with provisioning to the latest available time that resulted in generating the <code>exception.oracle.target.point.not_provisionable</code> exception has now been resolved.
DLPX-35480	Previously, static routes were being added using the <code>add</code> command. Now, the same can be added using the <code>create</code> command.
DLPX-57516	The issue with the failure of management service to start after configuring some abbreviated timezones from a picklist in server setup or sysadmin CLI has now been resolved.

Bug number	Description
DLPX-58133	Previously, the Oracle SnapSync operation was resulting in a warning for BCT usage on editions that do not provide it. This issue has now been resolved.
DLPX-58675	The issue with the deletion of the last snapshot on timeflow by Retention during a failed Oracle DB_SYNC operation has now been resolved.
DLPX-63003	The issue with memory being exhausted while reading too many snapshots from MDS has now been resolved.
DLPX-63347	If the staging source has the "Use as Staging" flag set as off, the user was seeing a specific exception while trying to enable a linked dSource to point in the direction of what needs to be done. Any compatibility failure will now have a specific exception.
DLPX-63601	Previously, querying the following operation "backupset table" and "whether a database is part of AG or not" was resulting in deadlocks and lock timeouts errors. We have now added retries to resolve the issue.
DLPX-64369	The issue with throwing <code>fault.oracle.linkedsource.incomplete.tempfile</code> for physical standby has now been resolved.
DLPX-65949	The issue with misleading status in the progress bar while taking a copy-only backup has now been resolved.
DLPX-69831	Previously, the Oracle dSource SnapSync operation was not displaying a clear failure message if a dSource <code>db_unique_name</code> is changed. This issue has now been resolved.
DLPX-70317	The issue with the restarting of the NFS-server by the reaper thread while deleting a vPDB from a linked CDB with Talaria turned on has now been resolved.

Bug number	Description
DLPX-71018	The issue with UI displaying only the suffix of the device name used by Hyper-V has now been resolved. UI now displays a unique device name for storage in Hyper-V.
DLPX-71292	The issue with the allowance of incremental SnapSync after LogSync throws <code>fault.oracle.linkedsource.log.conflict</code> has now been resolved.
DLPX-71639	The NFSv4 is now set as the default option when mounting datasets from OS platforms that support it.
DLPX-71769	The need to set permissions of <code>\$ORACLE_HOME/dbs</code> subdirectories using STARTUP SPFILE syntax is now removed.
DLPX-72011	The issue with the CLI network setup not configuring the first network interface when multiple interfaces exist has now been resolved.
DLPX-72186	The issue with CDB log file retention working incorrectly if a PDB has multiple time flows pointing to the same CDB timeflow has now been resolved.
DLPX-72432	The format of <code>zpool_iostat_60.log</code> has been enhanced in this release. A timestamp is recorded for each sample in the log, making it easier to determine the time for each sample.
DLPX-72956	The issue with disabling the Oracle LogSync after running the validated sync job has now been resolved.
DLPX-73575	The timezone monitoring is now added for the Windows hosts.
DLPX-73590	You can now refresh a VDB whose parent dataset is in a different group without needing authorization on the parent or its group.

Bug number	Description
DLPX-73800	The issue with the failure of olsnodes when run as a non-Oracle user has now been resolved.
DLPX-74504	The issue with throwing a new DUE and NotFoundException when ojdbc libs cannot be read has now been resolved.
DLPX-74945	UI now displays a detailed error message for transaction log-chain break fault.
DLPX-74992	The issue with the failure of SnapSync operation when Database incarnation reset-logs end time is changed from "2021-03-13 22:03:07.0" to "2021-03-13 21:03:07.0" for virtual pluggable database “ ” has="" now="" been="">">
DLPX-75389	The issue with the recording of the insufficient details by Logsync when dbid change was detected has now been resolved.
DLPX-75517	The issue with the failure of the Oracle vPDB provisioning with the "ORA-00959: tablespace 'TEMP' does not exist" error has now been resolved.
DLPX-75721	The issue with the failure of an Environment discovery with the "DelphixFatalException: Unknown Oracle Database status: REFRESHING" error has now been resolved.
DLPX-75737	The issue with saving unnecessary logs by Retention if bookmark falls exactly on a snapshot end SCN or snapshot end timestamp has now been resolved.
DLPX-75897	Previously, failure to start I/O services after the upgrade operation was resulting in a stack restart loop. This issue has now been resolved.
DLPX-75951	The internal error being signaled during VDB SnapSync by <code>removeUnneededZFSFiles</code> when a data file is physically removed during processing by an external cause has now been resolved.

Bug number	Description
DLPX-76288	The NFS latency for workloads involving a lot of parallel I/O (e.g. Oracle VDBs with concurrent accesses to many data files) is now improved.
DLPX-76388	Previously, entering key pairs directly into hook environment variables, as opposed to via a vault or as passwords were resulting in an internal error. This issue has now been resolved.
DLPX-76406	The issue with NFS-based VDBs becoming unresponsive has now been resolved.
DLPX-76447	The issue with the V2P Functionality to customize target directory structure for exporting database files to separate file systems not working as documented has now been resolved.
DLPX-76613	The issue with the unnecessary accumulation of heap when validated sync is active for dSources using an environment user that eventually can cause out of memory issues has now been resolved.
DLPX-76690	The issue with the removal of extraneous Oracle data files while creating snapshots has now been resolved. The extraneous Oracle data files are now removed during the provisioning operation.
DLPX-76692	For V2P operation, we now use the unbuffered copy method for better performance.
DLPX-76718	The issue with the creation of the extraneous Self-Service branch segments during the replication operation has now been resolved.
DLPX-76760	Environment clusters will now show faults from their child nodes.

Bug number	Description
DLPX-76802	Previously, the engines that are in the DEFERRED upgrade state were resulting in the "Large Receive Offload" option turned off which was leading to performance degradation in network transfers. This issue has now been resolved. Upgrading the engines that are in the DEFERRED state will also resolve the issue.  Screen reader support is now enabled.
DLPX-76891	CRON expression labels now ask for Quartz format on the user interface.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-76619	The NFS reliance on DNS to prevent VDB unresponsiveness related to DNS unreliability is now reduced.
DLPX-76203	The NFS latency for engines with many Oracle dNFS clients is now improved.
DLPX-76119	The issue with the Delphix Engine crashing or becoming unresponsive when canceling a replication job has now been resolved.
DLPX-76991	Optimized in-memory cache eviction by making minor improvements to I/O performance.

### Release 6.0.9.0 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-28435	MS SQL instances PatchLevel will be displayed in preference to the version on the UI.

Bug number	Description
DLPX-40005	Improved the error message that is displayed when a JDBC connection cannot be established or the Oracle database Instance is unavailable.
DLPX-48080	Oracle Home Check may generate spurious faults if Oracle Home entry does not exist in /etc/oratab.
DLPX-55951	Attempting to provision a plugin-based VDB onto an incompatible OS (Windows to Linux or vice versa) is possible in the UI, and would fail with a crash requiring a restart. Now an informative error message is shown after the attempt is made.
DLPX-59613	Fixed creation of retention policies workers on replica objects after failover.
DLPX-64307	Environment refresh should ignore cluster discovery for Oracle VDBs.
DLPX-66191	Fixed the side-effects of the native Windows "Recent Files" behavior, when large numbers of PowerShell operations are being run concurrently.
DLPX-67537	Domain administrators can now create, view, and edit the alert profiles of other domain users.
DLPX-69605	Poor error message when selecting Timeflow range.
DLPX-70502	On detaching a dSource, delete backup server entry from MDS and related ones if the backup server is unused.
DLPX-71002	In case we have null values coming for recovery_model from msdb.dbo.backupset table, the user will see a generic exception for manual sync and a fault for validated sync.
DLPX-71908	Users will now see a warning when they remove any object from the replication specification list.
DLPX-72012	Prevents the same IP address from being configured on more than one network interface.

Bug number	Description
DLPX-72411	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-72609	When we do MSSQL standalone environment discovery, the user will see a warning for databases attached to AG that are present and will not be discovered unless cluster environment discovery is selected.
DLPX-72695	Improved Oracle SnapSync performance by eliminating unnecessary calls to getTotalHoleBlocks.
DLPX-73409	Duplicate listener entry gets generated in MDS if Oracle listener is manually started with a non-uppercase name.
DLPX-73586	Fixed a display error of some snapshot names in the command line interface which showed references instead of actual names.
DLPX-73720	Provisioning an Oracle vPDB fails with "ORA-65149: PDB name conflicts with existing service name in the CDB or the PDB" if the PDB and CDB names are the same.
DLPX-74050	Environment names for Windows and Oracle Clusters are once again editable by users.
DLPX-74078	The Target Directory path is combined with other directories such as Data Directory, Archive Directory, Temp Directory, etc to build the full path for data files, archive logs, temp files, etc. As long as the combined paths are valid the V2P job proceeds.
DLPX-74197	Fixes a misleading warning about insufficient space on a replication target.
DLPX-74201	Snapshots created as a result of refresh or rewind operations will now be labeled as just "Snapshot" to avoid confusion. Users are advised to look at the Timeflow markers to know when the Timeflow operation was performed.

Bug number	Description
DLPX-74367	Delphix Engine repeatedly reports "Failed to parse logfile".
DLPX-74377	Improved diagnostics information for the case when Delphix Engine fails to connect to the Windows host.
DLPX-74387	fix an issue that causes the management service to crash under heavy CPU load.
DLPX-74398	Added handling of dangling nodes during Windows cluster environment add and refresh operations.
DLPX-74486	Delphix OS users cannot provision 12.2 TDE vPDB due to directory permissions in the default wallet location.
DLPX-74495	Enabled more logging in Delphix connector logs for timeouts.
DLPX-74681	During RAC vPDB provision, Oracle 19.9 target CDB crashes with ORA-00600 [krccfl_chunk] when BCT is enabled.
DLPX-74806	Improved error message displayed when the storage device initialization fails unexpectedly.
DLPX-74860	Provisioning the 2nd generation VDB fails if the dSource has imported read-only transportable tablespaces fails.
DLPX-74975	Allow adding invalid or unreachable paths as a shared backup location for dSources.
DLPX-75026	Invalid JDBC connections are not purged from the connection pool when the home is changed.
DLPX-75134	Improved performance for the Environment Databases pages when there are a lot of databases.
DLPX-75363	Update exception description is seen when the SnapSync fails for ASE encrypted database.

Bug number	Description
DLPX-75401	local listener set to null if oracle.lsnr.protocol_registration_order is quoted.
DLPX-75506	Fix a bug that can cause Oracle RAC VDBs to fail with stale NFSv3 mounts if NFSv4 is also enabled.
DLPX-75532	Insufficient heap memory settings on AIX cause connector and SnapSync to hang or crash.
DLPX-75663	FIPS compliant algorithms will be used while merging the old and new toolkit directories during environment refresh.
DLPX-75716	Delphix may remove Oracle VDB temp tablespaces during Snapsync.
DLPX-75735	Fixed creation of retention policies workers on replica objects after failover.
DLPX-75834	Rearranged Syslog configuration dialog inputs to avoid confusion and have a more consistent user experience.
DLPX-75858	BEQ processes can hold on to file descriptors leading to hook scripts hanging after upgrading to 6.0.7.0.
DLPX-76018	Remove hardcoded 5-minute timeout for doDropPDBKeepDatafiles.sh.
DLPX-76140	TDE SnapSync should ignore WARNING plugin violations.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-71980	Fix a bug that was causing the Delphix Engine storage pool to fail to import on boot under certain circumstances.

## Release 6.0.8.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-75804	Some Delphix operations may fail if mount and umount commands, on staging or target hosts, are setup to run as sudo and if sudo rules prohibit these commands from running with unrecognized options. The issue is fixed now after removing "-v" added in 6.0.8.0.

## Release 6.0.8.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-49694	Skip parsing of DBCC when code 0 is not present in the DBCC page output. In case the DBCC page has code 0 but not dbid, use bdbid (present in the buffer section).
DLPX-68764	VDB SnapShot does not progress if ASE database devices are not on Delphix storage, environment monitoring raises a fault. Subsequent VDB operations like enable, disable, start, stop, delete, snapshot, or refresh will fail.
DLPX-70793	Delphix Engine should not allow linking Oracle DB with null <code>db_unique_name</code> .
DLPX-71300	For newer ASE versions ( $\geq$ 15.7 SP138 and 16.0 SP02 PL05 and ASE 16.0 SP03), do not run DBCC PAGE anymore, as it was an identifier for DBCC CHECKALLOC that is already not run.
DLPX-71471	Error message asking user to manually perform disable/enable operation or correctly rename the target database back will be displayed during Start VDB, if VDB does not exist.
DLPX-71687	Provide a mechanism to enable VDBs up to filesystem mount point.

Bug number	Description
DLPX-71875	Fixed a bug that results in a memory reservation not being represented correctly in the Delphix API.
DLPX-72046	Deletion of vPDB in a vCDB shows this warning, "Encountered an error while shutting down and cleaning up Oracle files."
DLPX-72209	Downloading a support bundle is not supported at the same time that an upload of an upgrade image has been initiated by the same Delphix user.
DLPX-72319	Fixed an issue where some error dialogs would freeze in Internet Explorer 11.
DLPX-72705	Connection timeout when deleting remote shipper script can cause a timeout in LogSync client.
DLPX-72757	ASE sync using Dump History fails for large dump history files.
DLPX-72780	Timezone is set incorrectly for snapshots of Solaris 10 dSources and VDBs.
DLPX-72904	Storage capacity now includes usage from all file system objects, not just snapshots.
DLPX-73143	Fixed an issue where the support bundle dialog showed a loading spinner intermittently while jobs were running.
DLPX-73354	Traverse all shared backup locations while syncing, even if some of the paths are invalid or not reachable.
DLPX-73489	Fixed bug where adding or editing a parameter using the UI VDB Config Template "Text" tab was truncating the parameter's value.
DLPX-73602	Incorrect mount options used when a single instance RAC is linked as a standalone single instance.
DLPX-73607	Added paging for days with large numbers of snapshots to prevent slowdown.

Bug number	Description
DLPX-73623	Fixed an out-of-memory condition that occurs in SSH tunneling for encrypted log-syncs when storage latencies are high.
DLPX-73627	The help text on upgrade replication warnings have been updated to avoid confusion between Ignored and Resolved.
DLPX-73668	Fixed Missing security headers.
DLPX-73669	Cross-site request forgery (CSRF) issue in management UI.
DLPX-73727	Fixed an issue where the faults table was unable to navigate to other pages.
DLPX-73797	Fixed VDB refresh failures due to SQL Server Error 924 after setting VDB to single user mode.
DLPX-74025	Implemented logic to retry offline database along with a drop database to overcome deadlocks while off-lining or dropping the database.
DLPX-74029	VMware Hot-Add memory is not immediately reflected in the system API.
DLPX-74057	Fixed a typo in "Download Support Bundle" UI component where the word "suport" was missing a "p".
DLPX-74254	Ownership of files inside VDB now matches new owner when VDB owner is changed.
DLPX-74298	Fixed an issue where the user could not upload a keystore with a blank keystore passcode.
DLPX-74362	Fixes an issue with namespace deletion when the replication receive jobs have been cleaned up.
DLPX-74442	VDB Enable with attemptStart=false will now mount the datasets so that VDB can be started.

Bug number	Description
DLPX-74457	Cluster discovery for Oracle RAC clusters are partially failing on Solaris 10.
DLPX-74529	Fixed a bug so that an upgrade completes even when jobs fail.
DLPX-74542	Fixed a bug so that upgrade completion is properly handled after kernel upgrades.
DLPX-74645	Delphix Engine uses the uptime command to keep track of a target host reboot and auto start VDBs on the host. In some cases, the output of this command is not what is expected and causes unintended restart of a stopped VDB. This issue is now fixed.
DLPX-74656	Oracle errors during doCreateSPFile.sh are not captured.
DLPX-74704	Fixed a bug where the Dataset scroll does not extend to the bottom of a dataset list, thus truncating the status of the last dataset in the expanded group.
DLPX-74883	Prevent support bundle collection from cancelling replication.
DLPX-74911	Talaria TCP fallback fault may be misconstrued if an Oracle RAC node is down.
DLPX-74997	Prevent granting replicated roles to users.
DLPX-75083	Post upgrade cleanup task may become unresponsive while attempting a migration from 5.3.x to 6.0.x due to several threads stuck in WAITING state.
DLPX-75095	Provisioning an Oracle VDB fails if change-archivelog-mode.sh takes longer than 5 minutes.
DLPX-75134	Improved performance of the Environment Databases page under certain conditions.
DLPX-75188	Fixed "out of memory" issue when processing a large number of objects on the Target engine.

Bug number	Description
DLPX-75204	Addressed a performance issue on the Target engine when receiving large number of replicated objects.
DLPX-75208	Snapshot names are incorrectly redacted in the MDS dlp_x_action table in support bundles.
DLPX-75416	Fixed a replication issue when there are sources with TLS enabled.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-72065	Fixed a bug that can cause a Windows iSCSI initiator to fail connect to the Delphix Engine.
DLPX-72681	Console Delphix status screen shows a Python stack trace if the system is configured with a static IP address.
DLPX-73423	Console Delphix status screen shows a Python stack trace if the system has no default route.
DLPX-74216	Fixed an issue that causes management service failures in low memory situations.
DLPX-74622	Fixed a bug that can cause a replication job to fail with an internal error.
DLPX-75089	Fixed a bug that can cause NFSv3 clients to lose locks during upgrade verification.
DLPX-75524	Fixed a bug that can lead to Oracle data corruption when running VDBs on Oracle 19c with dNFS.

## Release 6.0.7.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-39006	LogSync failed with "Cannot read archived log due to failure of log shipping script".
DLPX-39245	Fixed a bug that caused the management service to become inaccessible if the storage pool ran out of space.
DLPX-59155	Provisioning a VDB or vPDB failed with unclear error message 'A database with the name "xxx" already exists'.
DLPX-60317	Fixed Out of Memory issue when replicating a large number of objects.
DLPX-60947	Replica VDBs will be updated when performing a point-in-time restore.
DLPX-62805	vPDB provision did not raise an error when a non-provisionable target point-in-time was provided.
DLPX-62969	Fixed Out of Memory issue when receiving large number of replicated objects.
DLPX-64600	Skipped connecting to ASE dSources during SnapSync policy runs as it is not applicable for them, hence prevent recurrent faults that the policy throws for connectivity issues.
DLPX-67363	Maximum identify provider authentication time age can be customized for single sign-on.
DLPX-67607	Fix to make Snapsync throw exception if manifest file is missing or of 0 bytes instead of internal error with null pointer exception.
DLPX-67767	Fixed a bug that caused the upgrade to hang, while waiting for running jobs to finish.

Bug number	Description
DLPX-70821	Allow the entity id for SAML single sign-on to be a URL for compatibility with Azure AD.
DLPX-71783	doRenameDatafiles cleanup of extra files fails due to file permissions mismatch.
DLPX-72010	Fixed an issue that prevents changing the default gateway using the network setup CLI.
DLPX-72075	Maximum SAML response time skew can be customized for single sign-on.
DLPX-72191	Oracle privilege discovery not performed for all homes if an invalid home exists.
DLPX-72351	When a user tries to change credentials for a dSource, validating the credentials before updating them. In case of invalid credentials, showing user an error message about it.
DLPX-72545	Initial ORA-65294 error not reported to user when vPDB provision fails due to compatible parameter mismatch.
DLPX-72652	Fix and issue that prevents use of the NFSv4 on some versions of SUSE Linux targets.
DLPX-72698	Patching Oracle 19C vCDB leads to ORA-25153 as described in 2285159.1.
DLPX-72807	Fixed issue with SQL Server 2014 dSources with filestreams where sync failed in merging filestream directories due to long path names.
DLPX-72882	Datasets hooks script editor properly displays multiline scripts instead of as one long line on non-Chrome browsers.
DLPX-72916	Empty string in SNMPv3 USM username creation no longer throws fatal error.

Bug number	Description
DLPX-73048	Non-sys user credentials for Oracle sources cannot use password vault.
DLPX-73108	Fix a bug that prevents the API from displaying the correct number of CPUs or amount of memory assigned to a Delphix Engine after a hot-add operation.
DLPX-73201	Fix an issue that prevents the configuration of additional NICs on Azure Delphix Engines.
DLPX-73202	Fix a bug that can cause a VDB to fail to mount while other VDBs are being stopped.
DLPX-73424	Fix a bug that prevents the sysadmin from deleting a default route.
DLPX-73527	SnapSync job fails with 'internal error during execution' due to ONS/FanManager errors.
DLPX-73528	Fixed a bug that prevented accessing SDD specs from CLI.
DLPX-73611	Kerberos ticket expiration date parsing is incorrect after migration from Illumos to Linux.
DLPX-73742	Provisioning an Oracle TDE-enabled vPDB fails with the error "ORA-28367: wallet does not exist" if the TDE wallet for the target linked CDB is stored on ASM storage.
DLPX-73765	Fix a file descriptor leak that causes the management service to crash over time.
DLPX-73789	Auxiliary CDB instance uses dSource keystore location if WALLET_ROOT is configured in dSource.
DLPX-74030	CDB database password may be leaked as part of environment monitor checks that launch sqlplus command on the source or target host.

Bug number	Description
DLPX-74043	Delphix OS user cannot provision TDE-enabled vPDB due to directory permissions in the default wallet location.
DLPX-74044	Delphix OS user cannot provision TDE-enabled vPDB in Delphix-writable keystore location due to directory permissions.
DLPX-74119	Drop database fails if default database is set to any other than master.
DLPX-74164	Sync fails with <code>db.aselddb.source.dump_history.incomplete_stripes</code> after dump history file is purged and Use dump history is enabled for the dSource.
DLPX-74233	During failover of a namespace, if there is a collision between an environment in the namespace with one on the target engine, the namespace environment will get renamed if its host does not match that of the environment on the target.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-73390	Improve replication receive throughput.
DLPX-73393	Improve write performance under extreme disk fragmentation.
DLPX-73280	Improve write performance under extreme disk fragmentation.

## Release 6.0.6.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-73848	Fixed an issue that can cause the management service to fail to start after upgrade on systems that have had SNMP enabled.
DLPX-73859	Fixed a file descriptor leak triggered by faults and alerts that can cause the management service to fail.

## Release 6.0.6.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-47065	VDB recovery failed when files other than archive logs were detected by Oracle.
DLPX-47493	Fixed the bug where VDB directory under the DelphixConnector directory was not being removed from the target host on MSSQL VDB deletion.
DLPX-48046	Added sorting parameter to network test APIs.
DLPX-61405	Replication may send more data than expected if masking involves dropping large DBF files.
DLPX-61525	The height of the storage configuration list was limited to show 3 disks at a time. It will now dynamically grow with the number of disks.
DLPX-63603	Increased connector timeout from 10 minutes to 30 minutes to avoid unnecessary faults due to timeout during Validated Sync operation.
DLPX-67368	Delphix Engine hostname change is now immediately reflected in Splunk events.

Bug number	Description
DLPX-67593	Fixed an issue that caused the management service to remain offline following an out-of-space condition.
DLPX-68531	Introduced better handling of UniversalConnectionPoolException errors during SnapSync.
DLPX-69759	Oracle environment discovery failed due to an unhandled exception occurring at insert into dlp_x_faults.
DLPX-69852	Fixed a bug that caused network configuration problems when removing and adding additional NICs.
DLPX-70426	Redaction of usernames took forever on tables with millions of entries.
DLPX-70583	move-to-asm.sh fails if timing is set in glogin.sql.
DLPX-70638	Removed Failed Actions section of Actions sidebar, in favor of manually dismissing from Running Actions and falling to Finished Actions section.
DLPX-70653	Removal of all instances in a RAC VDB should not be allowed.
DLPX-70808	Fixed issue related to the creation of empty DisableBroker.sql on the Windows machine in case DisableBroker.sql execution fails in the first attempt.
DLPX-70896	Added more detailed error message for when the Delphix Engine fails to push a script to Windows host.
DLPX-70919	Fixed an issue that causes job progress to not update in Self-Service.
DLPX-70928	Fixed a bug that results in a Delphix Engine remaining powered on following a shutdown from the user interface.

Bug number	Description
DLPX-71093	For AG databases, a full backup is not required even recovery fork guid changed but the LSN chain didn't break because of transactional log backups.
DLPX-71097	Unable to ignore snl.bct.needed warnings if Block Change Tracking is legitimately disabled on an Oracle dSource.
DLPX-71153	Recovery of PDB should fail if the database is down after offlining datafiles.
DLPX-71370	While deleting initiator in Windows environment deletion operation, delete all the views as well for that initiator.
DLPX-71685	VDB is auto disabled if the hook fails.
DLPX-71865	Reduced the size of support bundles.
DLPX-71961	When a PDB is selected for replication, its CDB and all other PDBs in the parent CDB get automatically selected for replication. Going forward, in the above scenario, while the CDB will get selected, its other PDBs will no longer get selected.
DLPX-72031	Fixed VDB refresh operations failures due to 'DB STARTUP' background process spid greater than 50.
DLPX-72066	Migrate VDB verifies against the old configuration, rather than new.
DLPX-72083	Fix an issue that causes a fully-qualified hostname to be changed on upgrade from 5.3 to 6.0.
DLPX-72131	Added namespace support for HashiCorp password vaults.
DLPX-72265	doCreateTempfiles.sh.template exits with code 0 on failure.
DLPX-72340	Incomplete recovery not detected during provisioning.

Bug number	Description
DLPX-72386	Unlock Solaris x86 Solaris -> Linux x86 provisioning.
DLPX-72452	For clusters with long hostnames, vPDB sync fails with exception.oracle.accessor.instances.missing.
DLPX-72495	Fixed a bug that prevents the application from coming up after an upgrade
DLPX-72686	Delphix no longer logs environment variables in logs on connected hosts since this could leak sensitive information such as passwords that are sometimes stored as environment variables on database hosts such as for the ASE database.
DLPX-72730	Fixed a Snapsync performance issue.
DLPX-72790	SnapSync job fails with 'internal error during execution' due to ORA-01652.
DLPX-72862	The scenario which was causing the null pointer has been fixed now.
DLPX-73300	Validation of connection to a container for PDBs should allow connecting to CDB\$ROOT.
DLPX-73311	Added platform detection for ESX 7.0u1.
DLPX-73449	Replication of policies between two engines, in a loop, could lead to OOM exceptions.

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-72990	Addressed a minor CVSS 5.9 security issue with no known attack vectors.
DLPX-73067	Fix for CVE-2020-10753.
DLPX-73069	Fix for CVE-2020-12059.

Bug number	Description
DLPX-73070	Fix for CVE-2020-1760.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-71924	Fixed a bug that causes support bundle collection to fail with an internal error.
DLPX-72918	Fixed a system crash that can happen when replicating a masked VDB using SDD.
DLPX-73147	Fixed a bug that can cause a replication source to crash if it had run replication while running on 5.0.

### Release 6.0.5.0 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-23360	The unistallation of the Delphix Connector installer should succeed even if one of the component connector services doesn't exist.
DLPX-69155	Reduced the time taken to generate support bundles in some cases.
DLPX-67316	Recreating a controlfile against an Oracle source may yield misleading error during snapshot.
DLPX-70766	JDBC driver updated to resolve intermittent JDBC connection failures due to JDBC SSL bug.
DLPX-70785	Options passed to VDB mounts on target AIX hosts did not include read and write size values. This fix adds the rsize and wsize parameters to mount command depending on the maximum values host is configured to support.

Bug number	Description
DLPX-70741	Enabling Validated Sync while SAP ASE SnapSync job is running leaves staging database unrecoverable.
DLPX-69865	Fixed a bug that causes a network interface to become unconfigured if its MAC address changes.
DLPX-71233	If LogSync is suspended when performing SnapSync of a standby database in real-time apply, SnapSync attempts to backup the archived logs which can cause SnapSync to become unresponsive.
DLPX-69800	UEM/Hostchecker directory ownership checks fail on HPUX environment with long usernames.
DLPX-69807	Provided mechanism for the user to bypass corrupted/incomplete jdbc libraries.
DLPX-66585	Bundle ID "fault.environment.configuration.file.owner" reports insufficient host address.
DLPX-65739	createDelphixDBUser.sh fails when "@" used in the password.
DLPX-70973	SAP ASE database provisioning fails if the source database has holes in log fragments.
DLPX-71532	Improved error handling for Oracle memory configuration errors.
DLPX-62987	Allowed assigning privileges over replicated objects through the UI.
DLPX-71593	TIMEFLOW_REPAIR incorrectly skips a log because of "wrong database".
DLPX-71751	Added NFSv4 support on AIX for Oracle and SAP ASE.
DLPX-71736	Dynamically disable RPC services if NFSv3 is no longer in use.

Bug number	Description
DLPX-71772	Network DSP Test between versions 5.3 and (6.0.3, 6.0.4) is fixed.
DLPX-71513	Replicate non-data objects like delphix engine users, authorizations, roles, permissions, policies and DB config templates.
DLPX-71305	Unable to load dummy recovery database dump due to SAP ASE error 15728.
DLPX-71172	Enabling SAP ASE dump history causes IllegalStateException in getDumpListFromLastRestoreDateAndFiles due to timestamp mismatch because of TZ.
DLPX-71178	SAP ASE internal error raised when dump history file is purged using sp_dump_history.
DLPX-65101	Fixed a race condition between a DB_DELETE job and the Oracle retention policy worker for the same container that can lead to a deadlock between the job and the worker.
DLPX-71918	Fixed an issue that causes the Delphix Engine UUID to change upon rebooting in IBM Cloud.
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."
DLPX-71611	Updated UI time zone library to IANA 2020a.
DLPX-70349	Fixed a memory leak during incremental replication.
DLPX-72038	Fixed an issue that prevents 5.3.x - 6.0.x upgrade if a static route exists that goes over a DHCP interface.
DLPX-72148	Fixed a bug of always order hooks alphabetically rather than the running order set by users.

Bug number	Description
DLPX-71971	Allowed Enable/Disable of VDB if its current Timeflow has at least one snapshot.
DLPX-72115	Changed the Time Point field on a VDB back to reflecting the point on the parent the VDB was created from, but displayed in the timezone of the parent.
DLPX-71995	6.0.4.0 can no longer interact with 5.3.x remote Masking Engines.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-70675	Fixed a bug that causes the system to become unresponsive after expanding multiple storage devices.

### Release 6.0.4.2 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-72155	Fixed an issue that can render a Delphix Engine unbootable if a reboot occurs after upgrade verification but before the upgrade is applied.
DLPX-71141	Fixed an issue where upgrading an Oracle dSource or changing the environment user in a linked Oracle dSource fails with the error "SOURCE_UPGRADE job for xxx failed due to an internal error during execution."

## Release 6.0.4.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-71930	Fix a bug that causes feature flags to be disabled when upgrading to 6.0.4.0.

## Release 6.0.4.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-68173	Resolved an issue where temporary database backup/ device files created for cleaning up the target database were not being deleted.
DLPX-68773	The management stack runs out of memory as the environment monitor does not purge stale objects.
DLPX-69573	Allow linking an Oracle PDB with a lowercase name.
DLPX-69634	Allow provisioning an Oracle PDB with a lowercase name.
DLPX-69962	After detaching a PDB, perform unplug/plug, and attach again, if disabled is performed before SnapSync, the PDB can no longer be enabled.
DLPX-66045	Prevent Self-Service Container branches getting into an unusable state by blocking deleting the last segment of branches.
DLPX-7037	Snapsync performs an unnecessary checkpoint.
DLPX-68277	Users will see the detailed error message upon connection failure to Delphix connector during OS user validation and there will also be a "More" button with an error message which will open an error popup with all error details.

Bug number	Description
DLPX-70288	On the "Add Environment" screen when OS user validation will get fail, they will see the "More" button along with the error message. When the user clicks the button, an error popup opens with all details of the error and suggested action.
DLPX-70832	NFSv4 support for appdata sources running on AIX.
DLPX-68495	Fixed GUI reporting conflict information when creating a Retention Policy.
DLPX-70788	Added Environment User field for MSSQL sources in Datasets -> Configuration -> Source tab -> Staging Environment section.
DLPX-58047	Fixed bug where the sort sequence was incorrect. Fixed in Hook Operation Templates.
DLPX-67931	Provision against VPDB after create/drop a new tablespace failed with exception.oracle.targetscripts.rename.datafiles.
DLPX-59910	Comps.xml associated with Oracle Homes are marked as unparseable if they are longer than 65535 characters.
DLPX-55476	CLI provisioning fails when the mount point provided includes quotes around the path.
DLPX-71168	Changed type to text and spaced "Secret Key" and "Username Key".
ORB-3285	Support using <a href="https://api.delphix.com">api.delphix.com</a> as a proxy for verifying the Cloud Agent binary's code signature certificate.
DLPX-71006	Allow provisioning across patch versions for Oracle versions on or after 18.X.
DLPX-71334	Migrate NTP configuration when upgrading between 5.3 and 6.0.

Bug number	Description
ORB-3286	Communication with Central management servers is now routed through the web proxy when one is configured for the Engine.
ORB-3117	Summary: Increase an action's failure message size to 256 characters so users can view large failure messages.

### Release 6.0.3.1 changes

#### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-71339	Fixed an issue that can cause the Virtualization Management service to become inaccessible when the system memory became highly fragmented.

### Release 6.0.3.0 changes

#### Fixes that take effect immediately after upgrade

#### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-68995	Improved performance of dataset deletion.
DLPX-68997 DLPX-68999	Improved single connection replication throughput.
DLPX-70697 DLPX-70703	Addressed an issue that causes long periods of I/O unresponsiveness.
DLPX-69953	Fixed a bug that can cause a Windows iSCSI initiator to fail to connect to the Delphix Engine.

Bug number	Description
DLPX-70512	Fix a hang in the I/O subsystem that can cause the Delphix Engine to become unresponsive.

## Release 6.0.2.1 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-70065	Provisioning a VDB from a dSource or another VDB will fail if the following conditions are met: <ul style="list-style-type: none"> <li>Delphix Engine has at least one dSource and a VDB created using a Python plugin prior to the upgrade</li> <li>Delphix Engine was upgraded to 6.0.2</li> <li>Provisioning was attempted from the UI after the completion of the upgrade</li> </ul>
DLPX-69350	Fixed an issue that the time point attribute of a VDB is not shown.

### Fixes that take effect after an optional reboot (Activated after optional Reboot)

Bug number	Description
DLPX-69864	Fixed an issue that causes MSSQL operations to hang after the reception of an iSCSI LUN reset.

## Release 6.0.2.0 changes

### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-62806	Fixed an issue where provision against PDB after unplug/replug against the same linked PDB fails with exception.oracle.targetscripts.controlfile.create.
DLPX-67567	Oracle Source Continuity creates an unnecessary source-archive file system on zfs.

Bug number	Description
DLPX-27807	LogSync may fall behind when connected to an Oracle physical standby database in Real-Time Apply mode.
DLPX-68385	Customer provided Oracle Java missing in the search path for Java on hosts.
DLPX-62782	Reducing the number of nodes for RAC VDB and VDB in NOARCHIVELOG mode may result in ORA-00258 errors during VDB enable operation.
DLPX-62738	Better error message when plugins are uploaded out of sequence.
DLPX-68722	The product now recognizes VMware with BIOS date of 12/12/2018 as VMware 6.7.0u2.
DLPX-68579	SnapSync of Oracle 19c DB with encrypted tablespace fails with fatal exception "Block header 91 is not empty".
DLPX-68689	Fixed the issue where a huge number of error messages from ASE caused OutOfMemory Error.
DLPX-68957	Always On AG discovery will not fail in a multi-subnet environment.
DLPX-63088	Can now recover multiple Self-Service containers at the same time.
DLPX-47977	Improved handling of snapshot standby.
DLPX-64125	SnapSync failed with exception.oracle.dsource.sync.no_hosts.rac on RAC clusters with very long hostnames.
DLPX-62584	PDB enable failed after migration if mountBase has a trailing slash.
DLPX-68657	Virtualization can now fetch jobs from Masking engines configured with HTTP redirection.

Bug number	Description
DLPX-69121	It is no longer mandatory to have at least one enabled system administrator with local credentials.
DLPX-68167	Fixed an issue where too many requests were being sent for Faults from the Datasets pages.
DLPX-69082	Large stderr produced by failed rsync jobs are truncated to prevent Java OutOfMemory errors.
DLPX-58600	Datasets filter updated so that all items within a group that matches the filter string are displayed, even if the items contained in the group do not match the filter string.
DLPX-65896	VDB deletion failed due to the inability to delete LogSync worker.
DLPX-57903	Improved diagnosability of PDB discovery issues.
DLPX-68878	Fixed issue where start/stop buttons were not being displayed in the RAC instances configuration table.
DLPX-69271	Enabled replication smart failover by default.
DLPX-66715	The user-visible name for Oracle cluster objects is being replaced with the Oracle cluster name. For Windows clusters, the user-visible name is being replaced with the cluster address.
DLPX-68929	Changed default replication settings for better out of the box performance.
DLPX-68930	Improved replication throughput when sending multiple timeflows.
DLPX-69245	Fixed a memory leak that occurs when experiencing connectivity errors.
DLPX-69377	At least one non LDAP system user should be enabled when the LDAP server is being disabled.

Bug number	Description
DLPX-68575	LDAP principal fields were not being redacted in phone-home bundles.
DLPX-68528	Self Service Recover operation failed due to missing Timeflow.

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-66808	Re-introduced console splash screen with IP address and service states.

### Release 6.0.1.1 changes

#### Fixes that take effect after an optional reboot (Optional on Reboot)

Bug number	Description
DLPX-69203	Improved synchronous write performance over iSCSI.
DLPX-69167	Improved SQL Server data ingestion performance by leveraging asynchronous writes on underlying storage.
DLPX-69298	Eliminated possible data corruption on SQL server and vFiles over iSCSI that can occur when a Delphix Engine reboots.

### Release 6.0.1.0 changes

#### Fixes that take effect immediately after upgrade

Bug number	Description
DLPX-60689	For SAP ASE, instead of using the DBCC CHECKALLOC command to fix DBID mismatch issue, the MOUNT command with FIXDBID and ALLOW_DBID_MISMATCH clauses will be used, to improve performance.

Bug number	Description
DLPX-65831	VDB snapshots need to clean unneeded ZFS datafiles.
DLPX-63949	Improved boot time after 5.3 to 6.0 migration by optimizing metadata indexing.
DLPX-66261	Upgrades to 6.0.0.0 will only be supported from a release greater than or equal to 5.3.6.0.
DLPX-66486	Snapshot of a linked database can end up with extra datafiles that do not belong to the database which might cause VDB on VDB provision to fail during rename of datafiles.
DLPX-66558	Cluster environment discovery was incomplete if the host locale was not English.
DLPX-66804	DB_LINK using incorrect user when RAC node also configured as a standalone environment.
DLPX-66768	vPDB save state lead to rollback or child provisioning failures.
DLPX-66823	Unable to link database with CL8MSWIN1251 charset.
DLPX-64538	Fixed a bug causing the timezone selector to only be visible when manually setting the time.
DLPX-66809	Removed the Windows Diagnostics Files and Directories on successful Diagnostics upload.
DLPX-67279	Provision failed when the source was from a RAC Oracle Standard Edition database and the target was Oracle Standard Edition.
DLPX-67451	Fixed an issue that sporadically caused replication to fail with an internal error.
DLPX-67454	Delphix Engine should select the highest version ojdbc driver available at ORACLE_HOME/ojdbc/lib.

Bug number	Description
DLPX-66077	Ensures child worker threads are gracefully exited when parent linked source sync job has completed/terminated.
DLPX-45983	MSSQL Validated sync will resume when storage usage falls below the threshold if storage threshold enforcement failed in the past.
DLPX-67560	Fixed an issue where MT provision may result in ORA-02058 due to un-purged or inflight 2PC transactions on dSource.
DLPX-67594	Old timeflows and snapshots are not getting removed by snapshot retention.
LX-2020	Report the correct amount of memory allocated to EC2 Nitro instances.
DLPX-67413	Fixed an issue where VDB point in time provisioning might fail if Oracle database environment is configured in a non-English locale.
DLPX-67684	PDB provisioning failed if the source had shutdown triggers.
DLPX-67575	Fixed failure during point in time 'Virtual to Physical' provisioning.
DLPX-67668	After setting the database online give it some extra time to startup completely, before doing any further operation on it.
DLPX-67759	Redact sensitive information from phone-home data.
DLPX-64638	Validated sync stops working if Delphix cannot connect to the backup server.
DLPX-65559	Even when the staging instance is down, attempt counter to detect backup files keeps on increasing and eventually, it stops detecting backups.

Bug number	Description
DLPX-56537	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-67894	Removing cluster resource without removing its dependency can result in cluster failure. So, added retryer logic while fetching the resource dependencies (Get-ClusterResourceDependency) and ultimately fail the operation after all the retries.
DLPX-67813	Unsupported SQL server backup type gets picked while validated sync and the operation fails while looking for the backup. So, introduced a tunable filter to automatically skip SQL backups taken by backup software not supported by yet Delphix.
DLPX-67925	Added env host connectivity toolkit support for SLES on Power9.
DLPX-67934	Retries to fetch image identifiers during Netbackup restore if there is a mismatch between MSDB and Netbackup Master.
DLPX-67655	Fixed an issue where retention enforcement can generate user-visible errors while attempting to delete snapshots with dependencies after PDB migration to new CDB.
LX-1944	EBS NVMe devices can now be used in Delphix Engines.
DLPX-68022	Fixed an issue where hostchecker 'Check Oracle DB Instance' fails on HPUX and AIX.
DLPX-68124	PDBs with lower/mixed case names will not enable after an upgrade.
DLPX-68126	Fixed a bug that limits the number of disks that can be added in GCP.

Bug number	Description
DLPX-67421	Update the primary db file names in a transaction with the Timeflow creation to make sure whenever a Timeflow is created successfully we have its primary file information.
DLPX-67440	Skip VDBs having its current Timeflow as null from 'PrimaryDbFileAvailabilityCheck' as these VDBs doesn't undergo queisceing and are recoverable by refreshing them.
DLPX-61818	Linking wizard - Target Environment step - Privileged Credentials authenticates on the selected target now.
DLPX-68117	Some non-Admin users, lack all permissions, are unable to login to upgraded engine.
DLPX-67290	A wrong version input by user while manually adding a SQL Server instance, created issues in provisioning VDBs. SQL Server version will now be auto-discovered for manually added instances on adding or refreshing the environment.
DLPX-66238	Updated error message to let know user that non discovered CDBs are filtered out from the list when linking a detached source.
DLPX-68457	When a target host is used by a large number of dSources for staging or has a large number of objects, the performance of Delphix operations like validated sync, refresh, rewind, etc can be slow due to Powershell processes being serialized.
DLPX-68484	Fixed the issue where 'lstart' column value of sysusages table was beyond the range of Integer data type by taking the Long data type to store the lstart value.
DLPX-68500	Fixed an issue where the NTP service is not started following a reboot.
DLPX-68290	Support bundle generation can be time-consuming if the engine has a large number of snapshots to process.

Bug number	Description
DLPX-67792	Fixed issue in grids in which the selection checkbox was unclickable.
DLPX-67555	Provision vPDB/vCDB fails with ORA-45900 if the parameter enable_pluggable_database is omitted when specifying database parameters for new vCDB.

### Fixes that take effect after an optional reboot

Bug number	Description
DLPX-67782	Engines running 5.3 on EC2 i3 can now be migrated to 6.0.
DLPX-67961	Fixed an issue that prevents ssh access after switching to a static IP address.
DLPX-65948	Fixed a bug that could cause replication jobs to fail with internal errors
DLPX-68025	Improved boot time after 5.3 to 6.0 upgrade by reducing the overhead of setting ZFS properties.
DLPX-67868	Fixed a bug that can cause the management service to run out of memory when disabling the Splunk integration.

### Release 6.0.0.0 changes

#### Fixes that take effect immediately after upgrade

Bug Numer	Description
DLPX-27433	The analytics GUI network graph shows newly added NIC information without requiring a management service restart.
DLPX-33998	If you add a hook script via the CLI, newlines are removed erroneously.

Bug Numer	Description
DLPX-40094	Correctly set the default type for the parameters to all operations in the CLI according to the container type.
DLPX-43215	Exclude sybsecurity from the list of auto-discovered databases.
DLPX-48712	Java 6 packages are no longer included in the product image.
DLPX-48280	When a user is set with the Provisioner role the 'provision' button does not appear, meaning anyone set with this role only is unable to provision VDBs.
DLPX-53996	The Delphix Engine does not provide instructions to browsers to avoid caching HTTP responses (pages).
DLPX-54740	Ensure Windows mount points are always unmounted as part VDB refreshes to prevent future VDB refreshes from failing due to "ERROR_ASSIGN_MOUNTPATH: failed to assign mount path for disk at="">>, error="">>,"
DLPX-55282	In environments where the vPDB has been provisioned using a Delphix provisioned virtual CDB, shutting down the virtual PDB causes it to get into an incorrect "Cannot monitor" state, this has now been fixed to show the correct "Stopped" state.
DLPX-55598	Fixed an issue where vPDB refresh/rollback triggers spurious vCDB restart jobs, after vPDB+vCDB auto-restart.
DLPX-55829	Validated Sync can fail when monitoring ASE backup servers started by using the \$DSLISEN environment variable instead of the "-S" argument. This can be worked around by accessing \$DSLISEN in the RUN_xxxxx script and pass it down as -S.
DLPX-55958	VDBs with no snapshots failed to re-enable after a Delphix Engine upgrade, this has now been fixed.
DLPX-57454	Display underlying ssh error when environment host connections fail.

Bug Numer	Description
DLPX-58519	Enable Oracle LiveSource when LiveSource is in RESYNC_NEEDED state currently re-start Oracle Redo Apply. Oracle Redo Apply should not be restarted in this state.
DLPX-58760	Fixed a TCP port leak in the network throughput test feature.
DLPX-58845	Provisioning vFiles to the same host using different OS Environment Users no longer fails.
DLPX-59772	The API to list all snapshots consumes a significant amount of memory when there are more than 100,000 snapshots on the engine.
DLPX-60356	Fixed an issue where Oracle remote listener registration fails if set to empty string.
DLPX-60603	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-60907	Fixed an issue where the Environment Monitor on Redhat 6.9 and 6.10 might throw unidentified version errors.
DLPX-60979	When user configures connection strings manually, these connect strings can end up connecting to incorrect PDBs/CDBs causing invalid snapshots. Verify that each connection to a PDB/CDB connects to the expected PDB/CDB.
DLPX-60993	Delphix backups create controlfile records; in rare circumstances, these records can cause invalid snapshots. To avoid this problem, remove Delphix backups control file records when using SCN-based SnapSyncs once a SnapSync completes successfully.
DLPX-62094	Allow certificates to expire after issuer certificate expiration.
DLPX-62241	Reduce SSH connections by temporarily preserving and reusing existing Delphix<->host connections where possible.

Bug Numer	Description
DLPX-62781	Spurious job event "DISCOVERED_TO_MANUAL_ORACLE_CLUSTER_NODES" no longer shows up for non-Oracle RAC environment refreshes.
DLPX-62892	In Oracle versions 18c and 19c, an Oracle bug can prevent the datafile headers from being updated for a standby database when managed recovery is running, resulting in failed SnapSync operations. Alert the user that an Oracle patch might be needed.
DLPX-62962	Removed unneeded EMPTY_RENEGOTIATION cipher
DLPX-62998	Fixed an issue where stale file mounts may be leftover when vPDB provision fails.
DLPX-63469	Initial setup now fails if the system was not provisioned with enough storage.
DLPX-63600	Network settings dialog now displays actual MTU value rather than a checkbox.
DLPX-64641	Fixed an issue where the last snapshot of a vPDB Timeflow can be deleted after the vPDB has been disabled, thus leaving the vPDB in a state with no provisionable snapshots.
DLPX-64711	Allow provisioning to complete when source CDB includes PDBs in a broken state.
DLPX-66020	Provision should remove files present in datafile filesystem that are not part of the database when provisioning a VDB from a VDB.
DLPX-67299	ASE environment discovery will not fail if there is a mismatch of "dataserver name argument" and value of "@@servername".

## Fixes that take effect after an optional reboot

Bug number	Description
DLPX-57384	Fixed a system hang caused by a deadlock in ZFS.

## Fixes that take effect after an optional reboot

Bug number	Description
DLPX-57384	Fixed a system hang caused by a deadlock in ZFS.

## Known issues

### Version 10.0.0.0

Key	Summary	Workaround
DLPX-5694 4	In Solaris 5.11 Environments where Delphix OS user shell is set to csh, host parameters may be improperly parsed leading to Environment refresh and other job failures.	Contact Delphix Support for corrective actions.
DLPX-5697 8	Certain usernames are not available for use as they are reserved system words (e.g. "root", "postgres", "delphix")	None
DLPX-5697 9	LDAP server test fails if authentication is set to DIGEST-MD5, but setup still works correctly	None
DLPX-5714 2	The Job dashboard does not display the user that invoked each Job	None
DLPX-5741 2	CLI parameters must be used exactly as described in documentation, including spelling and capitalization, or they are ignored	None
DLPX-5767 3	Support bundle generation can be time consuming if the engine has a large number of core files to process	None
DLPX-5782 3	Changing the masking engine used by a VDB's masking job can lead to an internal error	None
DLPX-5818 5	Changing a Custom Policy while it is running on an object can cause the Policy execution to fail	Disable/enable after fixing the problem
DLPX-5822 6	Completed Cleanup Job, After Upgrade, Still Shows as Running	None
DLPX-5947 3	It is not possible to set a password policy that prevents an Administrator from re-using a previous password, though this can be set for other users	None

Key	Summary	Workaround
DLPX-66155	Restarting a Continuous Data Engine during a network throughput test is not recommended as it may lead to a system hang.	Create an explicit rule in ADFS that transforms the emailAddress attribute into a nameid. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform emailAddress attribute into nameid.	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Continuous Data is establishing for each dSource better than Windows LSASS.EXE.
DLPX-77849	Excessive number of connections to SQL Server Instance observed by Delphix Environment User. This causes infra issues and leads to LSASS.exe to crash and host to reboot	Rather than using a Windows domain user for authentication switch the dSource to use a database user. It seems SQL Server may be able to handle the massive number of connections that Delphix is establishing for each dSource better than Windows LSASS.EXE.
DLPX-77986	On a SAP ASE host with multiple SAP ASE instances, If access to the first instance picked up for discovery fails due to invalid credentials, the discovery job will exit immediately preventing discovery of the remaining instances.	Fix any credential failures
DLPX-78589	During the upgrade, when Delphix was trying to run the SAP ASE "UNMOUNT" command while trying to quiesce VDBs, UNMOUNT command hung as this command doesn't run under a timeout and due to this upgrade job stalled.	When the ASE UNMOUNT command is hung, the ASE instance must be restarted.
DLPX-80193	Provide proper error message in case provisioning fails due to database is in read-only mode.	Change source database to read-write, create a backup and sync to the dSource and provision VDB.
DLPX-80920	A failed Delphix engine upgrade can cause plugin (for plugins using docker runtime) operation to fail with grpc_status 14.	<ol style="list-style-type: none"> <li>1. Verify the upgrade and then apply the upgrade.</li> <li>2. If the issue is hit after a failed upgrade, Restarting the management stack will resolve the issue.</li> </ol>

Key	Summary	Workaround
DLPX-81300	Windows Environment Add/Refresh operations may fail if the iSCSI Initiator Name is not a valid IQN	Set initiator name to a valid name, eg: iqn.1991-05.com.microsoft:10-43-47-42.qa-ad.delphix.com. The “Default” button can also be selected in windows iscsi configuration to reset to the default ( valid ) name.
DLPX-81478	If transaction log is taken using `standby_access` option for SAP ASE database, the validated sync worker will not be able to restore that log and will fail with Delphix Fatal Exception as Delphix currently doesnt support this option.	Change the backup script creating transaction logs Ingest FULL backups
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, the VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). For more information, please see <a href="#">KBA6234</a>
DLPX-83643	If you upgrade the engine or disable and then enable a virtual PDB, the displayed NFS version in the GUI or API might be incorrect. This happens if the virtual PDB is inside a virtual CDB and was previously mounted with NFSv3, but the host now supports NFSv4 mounts. However, the issue will automatically resolve itself during the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.
DLPX-84075	SQL Server VDB Refresh operations may fail if the PowerShell command [IO.Path]::GetTempFileName() returns no value"	Go to the below mentioned temp directory, and delete all the files from it: C:\Window\ServiceProfiles\NetworkService\appdata\local\temp
DLPX-84598	sysadmin user cannot view actions initiated by different sysadmin user	Perform an export with the same unique name as of the VDB and then manually change the physical database's unique name.
DLPX-85493	MSSQL: Linking and AttachSource operations will fail with unnecessary permissions of source user on the staging host and staging database. This issue can be seen from 6.0.17.0 onwards.	Adding source user to the staging instance with read permission on master database and Giving write permission on connector directory path {Connector_Installation}/sourceValidation

## Version 9.0.0.0

Key	Summary	Workaround
DLPX-8497 7	For RAC environments, export of an Oracle VDB to a database with a new unique name is not supported.	Perform the export with the same unique name as of the VDB and then manually change the physical database's unique name.
DLPX-8442 3	Export operation does not retain the read-only mode in the newly converted physical database after an in-place conversion of a read-only Oracle VDB or vPDB	None
DLPX-8459 8	sysadmin user cannot view actions initiated by different sysadmin user	None
DLPX-8465 5	A false warning message that listener registration was not successful is posted when enabling a VDB or a vCDB, users can ignore this message.	Ignore the warning message.
DLPX-8467 9	Unable to add Staging push PDB if Staging Environment has more than one repository.	<p>From the Add dSource Wizard dSource Configuration screen for Staging Push.</p> <ul style="list-style-type: none"> <li>• Before selecting PDB as the Database Type, select CDB.</li> <li>• Select the correct Staging Environment and repository.</li> <li>• Select PDB for the Database Type.</li> <li>• Now CDB will be shown under Container Database</li> <li>• Fill in the remaining PDB details</li> </ul>
DLPX-8507 6	Instance init file is not copied to \$ORACLE_BASE_CONFIG/dbs during staging push dSource linking	<p>Specify the pfile parameter in the startup command as</p> <pre>pfile=' /&lt;MOUNT_BASE&gt;/ &lt;DATABASE_UNIQUE_NAME&gt; /script/&lt;DATABASE_SID&gt;/ init&lt;DATABASE_SID&gt;.ora'</pre>

## Version 8.0.0.0

Key	Summary	Workaround
DLPX-84679	Unable to add Staging push PDB if Staging Environment has more than one repository.	<p>From the Add dSource Wizard dSource Configuration screen for Staging Push.</p> <ul style="list-style-type: none"> <li>• Before selecting PDB as the Database Type, select CDB.</li> <li>• Select the correct Staging Environment and repository.</li> <li>• Select PDB for the Database Type.</li> <li>• Now CDB will be shown under Container Database</li> <li>• Fill in the remaining PDB details</li> </ul>
DLPX-85076	Instance init file is not copied to \$ORACLE_BASE_CONFIG/dbs during staging push dSource linking	<p>Specify the pfile parameter to startup command as</p> <pre>pfile parameter=/<code>&lt;MOUNT_BASE&gt;</code>/ <code>&lt;DATABASE_UNIQUE_NAME&gt;</code> /script/<code>&lt;DATABASE_SID&gt;</code>/ init<code>&lt;DATABASE_SID&gt;</code>.ora</pre>

## Version 7.0.0.0

**⚠ Upgrades from versions < 6.0.17.0 to any version between 6.0.17.0 and 7.0.0.0 on a replication target engine** may fail due to the management services being down, which will require a support call. This applies to “Delay the Reboot” or “Apply Now” upgrades.

Key	Summary	Workaround
DLPX-84255	In a Single Engine Continuous Vault product, adding a new Sybase dSource to a locked group may result in the background environment monitoring process to stop working.	No workaround.
DLPX-84495	If upgrading from versions < 6.0.17.0 to any version between 6.0.17.0 and 7.0.0.0, a support call is needed.	Call support.

Key	Summary	Workaround
DLPX-84679	Unable to add Staging push PDB if Staging Environment has more than one repository	<p>From the Add dSource Wizard dSource Configuration screen for Staging Push.</p> <ul style="list-style-type: none"> <li>• Before selecting PDB as the Database Type, select CDB.</li> <li>• Select the correct Staging Environment and repository.</li> <li>• Select PDB for the Database Type.</li> <li>• Now CDB will be shown under Container Database</li> <li>• Fill in the remaining PDB details</li> </ul>
DLPX-85076	Instance init file is not copied to \$ORACLE_BASE_CONFIG/dbs during staging push dSource linking	<p>Specify the pfile parameter to startup command as</p> <pre>pfile parameter=/<code>&lt;MOUNT_BASE&gt;/</code> <code>&lt;DATABASE_UNIQUE_NAME&gt;/script/</code> <code>&lt;DATABASE_SID&gt;/</code> init<code>&lt;DATABASE_SID&gt;.ora</code></pre>

## Version 6.0.17.0

Key	Summary	Workaround
DLPX-66860	For SSO/SAML, ADFS requires explicit rule to transform emailAddress attribute into nameid.	Create an explicit rule in ADFS that transforms the {{emailAddress}} attribute into a {{nameid}}. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-83622	In 6.0.15.0 and 6.0.16.0, Fluentd gems from plugins were installed in the base Fluentd. These left over gems can cause Fluentd to fail post-upgrade.	No workaround.
DLPX-83643	After engine upgrade or after a disable and enable of a vPDB, the NFS version in GUI/API may be incorrect (if it's a vPDB in a vCDB, it was mounted with NFSv3 and now the host supports NFSv4 mounts). This condition corrects itself on the next refresh operation.	Perform a vPDB refresh operation to update the NFS protocol version to 4.

Key	Summary	Workaround
DLPX-83575	The port in the connection string for a vPDB in a Linked CDB may be shown incorrectly when it is registered to a non-default listener.	Use the port in the connection string of the CDB to connect.

### Version 6.0.16.0

Key	Summary	Workaround
DLPX-82448	Python2 has been deprecated and is being removed from the platform. During this removal, there are still trace artifacts of legacy Python versions being found on the engine.	No workaround.
DLPX-81559	After upgrading an Oracle VDB from 12c to 19c, the VDB refresh fails with "Failed to mount database instance" due to ORA-01130 or ORA-00201 errors.	Update the VDB parameters (either directly or via a VDB Config Template). For more information, please see <a href="#">KBA6234</a>
DLPX-82169	Provisioning a TDE-enabled vPDB to a CDB with a different patch level than the source CDB will fail.	Patch the dSource to match the target and provision again. If this is not an option, run datapatch on the vPDB, update the timeflow in MDS to a CONFIGURED state, restart the vPDB, and run SnapSync. This second option requires an engineering escalation.

### Version 6.0.15.0

Key	Summary	Workaround
DLPX-81610	If a tablespace is encrypted before an incremental snapshot is taken, provisioning from that snapshot can lead to the tablespace containing partially unencrypted data, which will not be accessible.	Take a snapshot with parameter "Force Full Backup" and provision a new vPDB/VDB with this snapshot.

### Version 6.0.14.0

Key	Summary	Workaround
DLPX-80489	TDE-enabled vPDB provisions failing with LOCAL_AUTOLOGIN configuration	Use a regular autologin wallet in the target CDB.

Key	Summary	Workaround
DLPX-80822	vPDB provision from a fully encrypted shared undo parent to local undo CDB results in a vPDB with new UNDO TS which is not encrypted	Encrypt the local undo space manually after provision, or with the Configure Clone hook point.
DLPX-81125	MSSQL Export fails when performed on a target with a Microsoft SQL Server instance running with the network service user	If you update the instance owner of the SQL server, you should refresh the environment to reflect the new user in the MDS.
DLPX-81128	Masking: Unable to create/edit a profile set from GUI	Profile set can be add/edited using API

### Version 6.0.13.0

Key	Summary	Workaround
DLPX-38908	LogSync should automatically resolve faults for transient issues.	Manually resolve the faults generated when Oracle LogSync encounters transient issues.
DLPX-57078	Job cancel requests during provisioning are not processed until the end of the step.	Find and kill the Oracle <code>pmon</code> process for the instance that is being provisioned.
DLPX-64386	LogSync thread hangs when trying to remove temporary RMAN command file from source host toolkit directory.	Remove the <code>rm</code> alias for the Delphix OS user.
DLPX-76382	Force disable should succeed despite environmental problems.	No workaround.
DLPX-78412	SCM/Talaria failure reason should be communicated in fault.	No workaround.
DLPX-78986	Prevent DSP connections for disabled cluster nodes.	No workaround.
DLPX-79212	While restoring full backups of file stream type database on open staging DB and taking snapshots, snapshots are consuming full space instead of referring to each snapshot.	No workaround.

Key	Summary	Workaround
DLPX-79355	V2P export throws an error when suspended and resumed at the Opening Database step.	Cancel the V2P export job and start the V2P export operation all over again.
DLPX-79502	SnapSync fails if more than 1000 tempfiles exist in the whole CDB.	No workaround.
DLPX-79596	DB files are getting deleted for staging DB if staging push dSource is forced disabled after performing a restore outside Delphix and then enabled again.	No workaround.
DLPX-79833	You can no longer select performance metric resolution for fluentd configurations.	No workaround.
DLPX-80385	Fluentd does not support deferred upgrades when upgrading to 6.0.13.0, and beyond, when starting from a prior release and using the Historic Splunk Insight solution.	Reboot after upgrade.

## Version 6.0.12.0

Key	Summary	Workaround
DLPX-67604	Manually recovering a database after V2P from a snapshot of dSource fails with an error.	No workaround.
DLPX-69775	Updating Oracle credentials with an empty string throws an error when Simplified Connection Management is enabled.	Use the Delphix CLI to unset the user.
DLPX-75209	Network configuration is lost when changing EC2 instance type.	On Nitro-based instance types, use the virtual machine's virtual serial console and login to the sysadmin CLI, then add a DHCP address to the network interface.
DLPX-75878	The JDBC connection string for an Oracle vPDB does not get updated after a listener port change.	A second environment refresh will update the connection string for the vPDB.

Key	Summary	Workaround
DLPX-77231	When source discontinuity on the dSource is followed by resync on the livesource, one or more livesource workers may fail to start. This prevents livesource status from getting updated and the first snapshot from being taken after a resync.	No workaround.
DLPX-78689	Oracle vPDB snapshot job fails after doing reset logs on a linked CDB.	Disable the vPDB and re-enable it to clear out the snapshot job errors.
DLPX-78700	Oracle vPDB source enable jobs for Oracle 21c are taking more than 15 minutes to complete. This issue is only seen during the first Oracle vPDB enable operation on Oracle 21c.	No workaround.

## Version 6.0.11.0

Key	Summary	Workaround
DLPX-44544	A SnapSync of an Oracle standby dSource in Real-Time Apply mode sometimes calculates the snapshot's timestamp incorrectly. This can cause ORA-01194 or ORA-01152 errors when provisioning to a timestamp after the snapshot.	To provision from a snapshot of an Oracle standby dSource in Real-Time Apply mode, provision by SCN instead of timestamp.
DLPX-57971	The latest snapshot of a LiveSource may take a long time to show the SCN/timestamp range on its card in the GUI.	No workaround.
DLPX-72123	Detaching or deleting an Oracle dSource may fail on RAC environments due to the failure of deletion of RMAN backups on RAC and the operation needs to be retried with the force option.	If the detach or delete operation on an Oracle dSource fails, retry the command using the force option.
DLPX-75209	Network configuration is lost when changing EC2 instance type.	On Nitro-based instance types, use the virtual machine's virtual serial console and login to the sysadmin CLI, then add a DHCP address to the network interface.

Key	Summary	Workaround
DLPX-77664	Oracle SnapSync fails with "RMAN-06183: datafile or datafile copy (file="" number="">> ) larger="" than="" maxsetsize="" if="" a="" datafile="" resized="" in="" the="" middle="" of="">>)"	One of the following three workarounds can be applied: <ol style="list-style-type: none"> <li>1. Re-issue SnapSync.</li> <li>2. Reduce the frequency of datafile resizes, or</li> <li>3. Ensure datafile resize operations are not being performed while the SnapSync operation is in progress.</li> </ol>
DLPX-77869	Unable to drop and recreate descending order (or any other functional) index as part of Oracle Connector masking/reidentification/tokenization jobs.	Oracle interprets descending order as functional indexes. There is no workaround. This is a known limitation of Drop Indexes for Oracle connectors that will be resolved in a future release.
DLPX-78015	V2P export with absolute data files is failing with an internal error.	No workaround.
DLPX-78263	A SnapSync of an Oracle standby dSource in Real-Time Apply mode sometimes fails with "exception.oracle.snل.linkedsource.current_sc n.invalid" if the rate of change in the database is low.	Force a log switch on all primary instances/nodes and then try another SnapSync.

## Version 6.0.10.0

Key	Summary	Workaround
DLPX-77467	Loading the setup app dashboard (as sysadmin) renders a server error popup with instruction to contact Delphix Support. This message can be ignored. However, it is known that this error impairs the ability to configure web proxy, PhoneHome, and SMTP servers via the GUI.	These settings can still be configured via the CLI. This issue will be fixed in the next version release.
DLPX-64082	Oracle provisioning scripts have hard-coded timeouts.	Retry the provisioning operation to see if it succeeds. Otherwise, contact Delphix Support.
DLPX-72369	RAC migration for VDB with a deleted parent may fail with error "Cannot update RAC instances if virtual source 'xxx' has a deleted parent."	No workaround.

Key	Summary	Workaround
DLPX-74896	Race condition during refresh may result in incorrect MDS entry for parent snapshot.	No workaround.
DLPX-75148	DSP throughput tests do not work when from-version is < 6.0.6.0 and target-version is >= 6.0.6.0.	No workaround, however, the user will need to upgrade the source version.
DLPX-75215	Switching AWS instance types can leave the Delphix engine with no network configuration.	On Nitro-based instance types, use the virtual machine's virtual serial console and login to the sysadmin CLI, then add a DHCP address to the network interface.
DLPX-75995	On Windows 2019 Server, with KB4598230 cumulative update, adding or refreshing an environment fails when PowerShell transcription is enabled.	The user has to turn off the transcription if the staging is on Windows 2019 Server with recent updates.
DLPX-77231	When source discontinuity on the dSource is followed by resync on the Oracle LiveSource, one or more LiveSources workers may fail to start. This prevents the LiveSource status from getting updated and the first snapshot from being taken after a resync.	No workaround.

## Version 6.0.9.0

Key	Summary	Workaround
DLPX-72186	CDB logfile retention works incorrectly if a PDB has multiple timeflows pointing to the same CDB timeflow.	No workaround.
DLPX-74749	Oracle ENVIRONMENT_REFRESH_AND_DISCOVER job may fail with "The object OraclePDBConfig does not exist on the system".	Manually run an environment refresh after the ENVIRONMENT_REFRESH_AND_DISCOVER job fails.

Key	Summary	Workaround
DLPX-75517	Provisioning an Oracle vPDB to a vCDB fails with "ORA-00959: tablespace 'TEMP' does not exist" if there is no temporary tablespace named TEMP within the production PDB\$SEED database.	One of the following two workarounds can be applied: <ol style="list-style-type: none"> <li>1. Re-attempt the vPDB provision to a linked CDB. The provision should succeed.</li> <li>2. Manually create (or rename) the TEMP tablespace in the production PDB\$SEED database, take a new snapshot of the vPDB, and provision from that snapshot to the vCDB.</li> </ol>
DLPX-75737	Retention saves unnecessary logs if the bookmark falls exactly on a snapshot end SCN or snapshot end timestamp.	No workaround.
DLPX-75995	On Windows 2019 Server, with KB4598230 cumulative update, adding or refreshing an environment fails when PowerShell transcription is enabled.	The user has to turn off the transcription if the staging is on Windows 2019 Server with recent updates.
DLPX-76388	Entering key pairs directly into hook environment variables (a new feature in 6.0.9.0) results in an internal error.	Use password variables instead, or use a password vault. See <a href="#">Passing Credentials Securely to Hook Operations</a>

## Version 6.0.8.0

Key	Summary	Workaround
DLPX-64307	Environment refresh should ignore cluster discovery for VDBs	<p>The following workaround should resolve the issue without Delphix support intervention.</p> <p><b>For RAC databases</b></p> <ol style="list-style-type: none"> <li>1. Add the instances to the clusterware configuration, ensuring you add all instances configured via Delphix. For example:</li> </ol> <pre data-bbox="906 674 1422 853"> srvctl add instance -db &lt;Database Name&gt; -instance &lt;Instance Name&gt; -node &lt;Node Name&gt; </pre> <ol style="list-style-type: none"> <li>2. Refresh the environment. At this point, Delphix will add the instances back to the Delphix configuration, and you should be able to perform actions such as stop, start, disable, enable, etc.</li> </ol> <p>From here, we recommend removing the clusterware configuration.</p> <ol style="list-style-type: none"> <li>3. Stop the VDB via the Delphix GUI or CLI.</li> <li>4. Remove the instances from clusterware</li> </ol> <pre data-bbox="906 1223 1422 1368"> srvctl remove instance -db &lt;Database Name&gt; -instance &lt;Instance Name&gt; </pre> <ol style="list-style-type: none"> <li>5. Remove the database from clusterware</li> </ol> <pre data-bbox="906 1435 1422 1547"> srvctl remove database -db &lt;Database Name&gt; </pre> <ol style="list-style-type: none"> <li>6. Refresh the environment.</li> <li>7. Start the VDB via the Delphix GUI or CLI.</li> </ol> <p><b>For RACOne databases</b></p> <ol style="list-style-type: none"> <li>1. Stop the instance.</li> </ol> <pre data-bbox="906 1760 1422 1872"> sqlplus "/as sysdba" shutdown immediate </pre>

Key	Summary	Workaround
		<p>2. Ensure the RACOne configuration has the "instance prefix" configuration set.</p> <pre data-bbox="906 439 1423 618">[oracle@mwtestx1 ~]\$ srvctl config database -d &lt;vdb name&gt;   grep "Instance name prefix" Instance name prefix: VDB</pre> <p>3. If this is not set, then set it using</p> <pre data-bbox="906 680 1423 831">srvctl modify database -db &lt;vdb name&gt; -instance &lt;instance prefix&gt;</pre> <p>4. Set the pfile location to allow clusterware to start the instance</p> <pre data-bbox="906 925 1423 1043">srvctl modify database -db &lt;vdb name&gt; -spfile &lt;path to pfile&gt;</pre> <p>The pfile is located in</p> <pre data-bbox="906 1106 1423 1225">&lt;Delphix Mount base&gt;/&lt;VDB Name&gt;/datafile/spfile.ora</pre> <p>5. Start the instance using clusterware</p> <pre data-bbox="906 1288 1423 1373">srvctl start database -d vdb</pre> <p>When querying the status of the database, it should now show a running instance. As an example:</p> <pre data-bbox="906 1498 1423 1715">[oracle@mwtestx1 ~]\$ srvctl status database -d VDB Instance VDB_1 is running on node mwtestx1 Online relocation: INACTIVE</pre> <p>6. Refresh the environment. At this point, Delphix will add the instances back to the Delphix configuration, and you should be able to perform actions such as stop, start, disable, enable, etc.</p>

Key	Summary	Workaround
		<p>From here, we recommend removing the clusterware configuration.</p> <p>7. Stop the VDB via the Delphix GUI or CLI.</p> <p>8. Remove the database from clusterware</p> <pre data-bbox="906 533 1423 651">srvctl remove database -db &lt;Database Name&gt;</pre> <p>9. Remove the database from clusterware</p> <pre data-bbox="906 712 1423 831">srvctl remove database -db &lt;Database Name&gt;</pre> <p>10. Refresh the environment.</p> <p>11. Start the VDB via the Delphix GUI or CLI.</p>
DLPX-72186	CDB logfile retention works incorrectly if a PDB has multiple timeflows pointing to the same CDB timeflow	No workaround.
DLPX-73409	Duplicate listener entry gets generated in MDS if Oracle listener is manually started with non-uppercase name	<p>Follow these steps:</p> <ol data-bbox="906 1144 1414 1330" style="list-style-type: none"> <li>1. Restart the listener without a name parameter so it displays in uppercase.</li> <li>2. Update VDBs to use uppercase LISTENER.</li> <li>3. Refresh the environment. lowercase listener will be removed and LISTENER updated appropriately.</li> </ol>
DLPX-74749	Oracle ENVIRONMENT_REFRESH_AND_DISCOVER job may fail with "The object OraclePDBConfig does not exist on the system"	Manually run an environment refresh after the ENVIRONMENT_REFRESH_AND_DISCOVER job fails.
DLPX-74860	Provisioning a 2nd generation VDB from a dSource with imported RO transportable tablespaces fails with ORA-19654	No workaround.
DLPX-74882	Masking's SFTP client no longer compatible with SolarWinds and Goanyware SFTP servers	No workaround.

Key	Summary	Workaround
DLPX-75517	Provisioning an Oracle vPDB to a vCDB fails with "ORA-00959: tablespace 'TEMP' does not exist" if there is no temporary tablespace named TEMP within the production PDB\$SEED database	One of the following two workarounds can be applied: <ol style="list-style-type: none"> <li>1. Re-attempt the vPDB provision to a linked CDB. The provision should succeed.</li> <li>2. Manually create (or rename) the TEMP tablespace in the production PDB\$SEED database, take a new snapshot of the vPDB and provision from that snapshot to the vCDB.</li> </ol>

### Version 6.0.7.0

Key	Summary	Workaround
DLPX-74457	Cluster discovery for Oracle RAC partially fails on Solaris 10	Switch the default login shell for the Delphix OS user from /bin/sh to /bin/bash .
DLPX-74749	Oracle ENVIRONMENT_REFRESH_AND_DISCOVER job may fail with "The object OraclePDBConfig does not exist on the system"	Manually run an environment refresh from the Delphix UI if the ENVIRONMENT_REFRESH_AND_DISCOVER job fails with the mentioned error.
DLPX-76718	Time required to display the point-in-time pop-over on timelines for Self-Service Templates with replicated objects can degrade linearly with each replication.	No workaround but reducing replication frequency can reduce the impact.

## Version 6.0.6.0

Key	Summary	Workaround
DLPX-73224	When provisioning from a non-multitenant source to a virtual pluggable database (vPDB), the post-plug hook script (dx-post-plug-hook.sh) should exit with the vPDB either closed or open unrestricted. If the vPDB is left open with restricted access subsequent Snapshots of the vPDB will fail with "oracle.ucp.UniversalConnectionPoolException" and " java.sql.SQLException: ORA-01035 ORACLE only available to users with RESTRICTED SESSION privilege" .	To prevent the issue: Ensure that the vPDB is either closed/mounted or open unrestricted when exiting from dx-post-plug-hook.sh.  After it has happened: close and reopen the vPDB.
DLPX-72749	Provisioning a TDE-enabled vPDB with system encrypted tablespaces fails with the error "ORA-28374: typed master key not found".	No workaround, contact Delphix Support (TBD)
DLPX-72655	Provisioning an Oracle TDE-enabled vPDB fails intermittently if the dSource is encrypted after linking	Enabling TDE on an existing non-encrypted dSource is not supported. Detach, rename the Delphix dSource name and re-attach it as a new TDE-enabled dSource before re-attempting the provisioning operation.
DLPX-73224	When provisioning from a non-multitenant source to a virtual pluggable database (vPDB), the post-plug hook script (dx-post-plug-hook.sh) should exit with the vPDB either closed or open unrestricted. If the vPDB is left open with restricted access subsequent Snapshots of the vPDB will fail with "oracle.ucp.UniversalConnectionPoolException" and " java.sql.SQLException: ORA-01035 ORACLE only available to users with RESTRICTED SESSION privilege"	To prevent the issue: Ensure that the vPDB is either closed/mounted or open unrestricted when exiting from dx-post-plug-hook.sh.  After it has happened: close and reopen the vPDB.
DLPX-73357	Rewinding an Oracle TDE-enabled vPDB to the snapshot before vPDB migration may fail with <code>exception.oracle.tde.export.keys.failed</code> if all of the steps of the keystore merge procedure are not followed correctly	Verify that the CDB is restarted after merging the keys of the old target CDB into the new target CDB and re-attempt the rewind operation.  If the rewind still fails, provision a new vPDB from the required snapshot instead of the rewind operation.

Key	Summary	Workaround
DLPX-72181	<p>The "Restore Self-Service data container from the bookmark of sibling data container" operation may fail in an Oracle TDE environment with</p> <pre>exception.oracle.tde.export.keys.failed</pre> <p>if the keystore merge procedure is not followed correctly. In this case, the warning "Refresh operation on the TDE-configured container &lt;target container&gt; from the Timeflow of another container &lt;sibling container&gt; requires merging of the TDE keystores." will be displayed in the Delphix UI events log</p>	<p>Verify that the procedure for merging the sibling keystores is followed correctly and re-attempt the self-service operation.</p>
DLPX-73742	<p>Provisioning an Oracle TDE-enabled vPDB may fail with the error "ORA-28367: wallet does not exist" if the TDE wallet for the target linked CDB is stored on ASM storage</p>	<p>Storing the TDE wallet on ASM storage is currently unsupported. Modify <code>sqlnet.ora</code> to point to the keystore location outside of the ASM diskgroup and re-attempt the provisioning operation.</p>
DLPX-73788	<p>Provisioning or enabling an Oracle TDE-enabled vPDB fails when \$ORACLE_BASE is used in sqlnet.ora</p>	<p>Any environment variable referenced in sqlnet.ora must always be set in the environment for the Delphix OS user. Ensure that the environment variable \$ORACLE_BASE is set in the shell initialization file for the Delphix OS user and re-attempt the operation.</p>
DLPX-73789	<p>If WALLETS_ROOT initialization parameter is configured on a TDE-enabled dSource PDB, provisioning may fail since the auxiliary CDB instance uses dSource keystore location.</p>	<p>If the provision fails, there are 2 workarounds:</p> <ol style="list-style-type: none"> <li>1. Provide permissions to the Delphix OS user to create files in the location identified by WALLETS_ROOT directory of the source keystore on the target host.</li> <li>2. Modify the dSource database to not use WALLETS_ROOT to identify the TDE keystore.</li> </ol>

## Version 6.0.2.0

Key	Summary	Workaround
DLPX-69638	Masking job created on engine 6.0.1.1 or prior is failing after the upgrade to version 6.0.2.0 or later	Masking jobs created in 6.0.1.x using a Hana JDBC driver will need to be updated to grant the following permission {"java.io.FilePermission" "/", "read"} in 6.0.2.0. All drivers created in and after 6.0.2.0 will be granted this permission by default.

## Version 6.0.0.0

Key	Summary	Workaround
DLPX-60397	If a mapping algorithm is included in multiple jobs, only one job should be run at a time. If multiple jobs are run at the same time, then the mapping algorithm might contain multiple mappings to the same value or the jobs might deadlock.	Only run one job at a time.
DLPX-60947	Self-Service template with replica VDB is not updated with new Timeflow on incremental replication update	The latest replica VDB data can still be accessed by doing a Self-Service container Refresh, rather than a point-in-time restore from the template.
DLPX-61079	Certificate import validation may incorrectly reject a root CA certificate	Support must manually import the certificate into the truststore.
DLPX-61405	Masking operation should wait for zfs delete queue to drain	Replication may send more data than expected if masking involves dropping large DBF files.
DLPX-64493	V5 API /roles endpoint missing certain items	View and set these privileges through the GUI
DLPX-66155	Failed DSP engine test leads to multiple blocked client.jar processes on target hosts.	Restarting a Delphix Engine during a network throughput test is not recommended as it may lead to a system hang.

Key	Summary	Workaround
DLPX-66860	ADFS does not like NameIDPolicy sent by SSO app	Create an explicit rule in ADFS that transforms the {{emailAddress}} attribute into a {{nameid}}. The rule type must be "Transform an incoming claim". The incoming claim type must be "Email address" and the outgoing claim type "Name ID". The nameid format must be "Email address".
DLPX-66973	Date format is changed after importing the environment	Either (a) use the GUI import feature and then review the imported date formats for correctness or (b) use EngineSync to export/import jobs, which will not alter the date format.

## Deprecated and end-of-life features

### Release 10.0.0.0

#### Deprecated features

- **ESXi 6.5 and 6.7**

VMware's end of technical guidance for ESXi 6.5 and 6.7 is on 11/15/2023. To align our support, Delphix will end support of ESXi 6.5 and 6.7 in version 15.0.0.0 (November 2023 release).

### Release 9.0.0.0

#### Deprecated features

- **Oracle**

Oracle `move-to-asm.sh` scripted procedure has been deprecated in favor of the new feature "**Export an Oracle virtual DB or virtual PDB to a physical Oracle ASM or Exadata database**". For more details on this new feature, refer to the [Export an Oracle VDB or vPDB to a Physical ASM or Exadata Database](#) section. The `move-to-asm.sh` scripted procedure is still supported in 9.0.0.0, but is discouraged by Delphix and will be eventually removed in future versions of the Delphix Continuous Data Engine.

### Release 6.0.17.0

#### End-of-life features

- **Oracle 11.1**

Details of the Oracle database EOL can be found in the [Oracle Lifetime Support Policy](#) PDF.

### Release 6.0.12.0

#### End-of-life features

- **Internet Explorer 11 support**

Internet Explorer 11 is no longer supported by Delphix. The users are requested to refer to the list of [supported browsers](#).

- **EBS 12.1 support**

Starting 6.0.12.0 and beyond, EBS 12.1 is no longer supported by Delphix. The users are requested to [upgrade](#) to EBS 12.2 and start using this plugin.

- **SAP HANA 1.0 support**

Starting 6.0.12.0 and beyond, SAP HANA 1.0 is no longer supported by Delphix. The users are requested to [upgrade](#) to HANA 2.0 and start using this plugin.

## Release 6.0.11.0

### Deprecated features

- **Oracle 11.1**  
Details of the Oracle database EOL can be found in the [Oracle Lifetime Support Policy](#) PDF.
- **TLS 1.0 and 1.1**  
These versions of TLS are known to be vulnerable, enterprise use is heavily discouraged.

### End-of-life features

- **Oracle 10g Support**
- **TLS 1.0 and 1.1**  
These versions of TLS are known to be vulnerable, enterprise use is heavily discouraged.

## Release 6.0.10.0

### End-of-life features

- **EBS12.1**  
EBS 12.1 remains deprecated with a planned EOL (and removal from the product) in December 2021. This is in line with Oracle's planned EOL for EBS 12.1 later this year. The users are encouraged to [upgrade](#) to Delphix's EBS 12.2.
- **Masking ruleset edit options**  
The Table Suffix, Add Column, Join Table, and List options were deprecated in the 6.0.3.0 release. These options have reached the EOL in the 6.0.10.0 release and have been completely removed from the product.
- **Internet Explorer 11 support**  
Internet Explorer 11 is planned for EOL in December 2021. This is in line with Microsoft's planned EOL for Internet Explorer 11 later this year.

## Release 6.0.9.0

### End-of-life features

- Delphix Reporting (Formerly, *Mission Control*) is EOL starting 6.0.9.0 (July 1st, 2021). The users interested in continuing their reporting workflows are recommended to discuss Data Control Tower with their account teams.
- Also, EBS 12.1 remains deprecated with a planned EOL (and removal from the product) in December 2021. This is in line with Oracle's planned EOL for EBS 12.1 later this year. The users are encouraged to [upgrade](#) to Delphix's EBS 12.2.

## Release 6.0.8.0

### End-of-life features

- SAP ASE 15.0.3
- Windows Server 2008 R2
- SQL Server 2008
- SQL Server 2008 R2

## Release 6.0.7.0

### Masking End-of-life features

- ESX 5.5 support will be end-of-life in 6.0.7
- Masking Connectors: Db2 LUW and zOS v9, Db2 LUW and zOS v10, SQL Server 2005, 2008, 2008 R2

## Release 6.0.5.0

The following list of OS and DB versions are now past their respective support windows. Delphix will deprecate these versions to stay in line with Microsoft, Oracle, and SAP lifecycle policies:

- Windows 2008 R2: Microsoft End of Extended Support (EoES) January 4th, 2020
- SQL Server 2008/2008 R2: Microsoft End of Extended Support (EoES) July 9th, 2019
- Oracle 10: Oracle End of Extended Support (EoES) July 2013
- SAP ASE 15.0.3: SAP End-of-Life (EoL) March 31st, 2015

## Release 6.0.4.0

### End-of-life features

- **Masking:**
  - Job Scheduler - As of this release, Delphix has removed the Job Scheduler feature. The introduction of Masking's REST API several releases ago allowed customers to schedule job executions using their preferred job scheduler. As a result, the integrated scheduler is seldom used.

### Deprecated features

- **Masking:**
  - FTP, SFTP, and mount upload for XML and Cobol formats - FTP/SFTP/Mount-based format import were the original modes for XML and Cobol files, since then, Delphix has added the ability to upload a format file, which is far simpler to set up. After the introduction of "upload", we've seen a dramatic shift away from the legacy import modes in favor of the simplicity of "upload".
  - Row Type Feature - Originally geared for limiting masking to subsets of rows within a column, this feature was seldomly used. Its functionality, if desired, can still be replicated via the Custom SQL feature.
  - Redundant Settings for 'Edit Table' under Rule Sets - Table Suffix, Add Column, Join Table, and List - These settings are redundant and can be replicated with the Custom SQL setting.
  - 'HAVING' clause from Masking API - Deprecating due to low use. This feature, if desired, can be replicated with Custom SQL.

## Release 6.0.2.0

### End-of-life features

- AWS i.3 (EOL) January 22, 2020
- Microsoft Azure GSx (EOL) May 7, 2020

## Release 6.0.0.0

### End-of-life features

- **Removed Virtualization Features:**

A few features will be removed with the 6.0 release. If these features are in use, the upgrade will not proceed.

  - Cross Platform Provisioning (XPP)
  - AIX 6.1 Technology Levels 0-6 and AIX 7.1 Technology Levels 0-2 for Environments
  - Windows Server 2008 for Environments

 Windows Server 2008 will not have an upgrade blocker.

- **Removed Masking Features:**

Please note that Excel files can still be masked by first converting them to one of Delphix's supported file types (CSV, etc). Also, XML CLOBs can be masked by extracting their values into a table (example - using `extractValue` in Oracle).

- Native XML CLOB masking: After upgrade, columns masked as XML CLOBs will have the NULL SL algorithm assigned.
- DB2 9.1, 9.5, and other 9.x versions of LUW & Z/OS
- "Create target" job option: After upgrade jobs using "create target" will be removed.
- "Bulk data" job option: After upgrade, jobs using "bulk data" will be turned into non-bulk data jobs.
- Native Microsoft Excel Masking: After upgrade, MS Excel connectors, rulesets and jobs will be removed.

## Db2 4.5.1 release notes

### What's new

The DB2 plugin 4.5.1 release consists of only bug fixes. For more information, see [Fixed Issues](#)

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

 • Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

#### Key:

Color	Supported?
Y	Yes
N	No

### Red Hat Enterprise Linux (RHEL)

 Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

 In the case of HADR, all source, staging, and target should be on the same fix pack version.

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 4.5.1.
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0.

<b>Your version</b>	<b>Recommended upgrade path to Db2 4.5.1.</b>
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1.
4.0.0 4.0.1	Upgrade directly to 4.1.0, 4.1.1, 4.1.2, 4.1.3, 4.2.0, 4.2.1, or 4.3.0, 4.3.1, 4.3.2, 4.4.0, 4.4.1, 4.4.2, 4.5.0, 4.5.1.
4.1.0 4.1.1 4.1.2 4.1.3	Upgrade directly to 4.2.0, 4.2.1, or 4.3.0, 4.3.1, 4.3.2, 4.4.0, 4.4.1, 4.4.2, 4.5.0, 4.5.1.
4.2.0 4.2.1	Upgrade directly to 4.3.0, or 4.3.1, 4.3.2, 4.4.0, 4.4.1, 4.4.2, 4.5.0, 4.5.1.
4.3.0 4.3.1 4.3.2	Upgrade directly to 4.4.0, 4.4.1, 4.4.2, 4.5.0, 4.5.1.
4.4.0 4.4.1 4.4.2	Upgrade directly to 4.5.0, 4.5.1.
4.5.0	Upgrade directly to 4.5.1.

## Fixed issues

<b>Key</b>	<b>Summary</b>
DB2-2112	DB2 pre-snapshot phase runs rollforward to EOL on RF pit configuration

## Known issues

<b>Key</b>	<b>Summary</b>	<b>Workaround</b>
DB2-2107	db2cckbcp fails for Backup paths with spaces	Remove blank spaces from backup paths

<b>Key</b>	<b>Summary</b>	<b>Workaround</b>
DB2-2124	The instance name at target and true prod cannot be the same if the storage paths are sub directories of another storage path.	Create instance name on target different than true production

#### Unsupported DB2 features

- V2P
- Migrating a DB2 Database

## Db2 4.5.0 release notes

### What's new

#### Support for multiple backup paths for dSource ingestion

The Db2 Plugin 4.5.0 version introduces the support for multiple backup paths instead of one for dSource ingestion. This allows you to provide single backup path for the dSource ingestion and add more backup paths with a dynamic UI to accommodate for the extra backup directories where the backup was split into.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

 • Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

#### Key:

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 4.4.2.
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0.
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1.
4.0.0 4.0.1	Upgrade directly to 4.1.0, 4.1.1, 4.1.2, 4.1.3, 4.2.0, 4.2.1, or 4.3.0, 4.3.1, 4.3.2, 4.4.0, 4.4.1, 4.4.2.
4.1.0 4.1.1 4.1.2 4.1.3	Upgrade directly to 4.2.0, 4.2.1, or 4.3.0, 4.3.1, 4.3.2, 4.4.0, 4.4.1, 4.4.2
4.2.0 4.2.1	Upgrade directly to 4.3.0, or 4.3.1, 4.3.2, 4.4.0, 4.4.1, 4.4.2.

<b>Your version</b>	<b>Recommended upgrade path to Db2 4.4.2.</b>
4.3.0 4.3.1 4.3.2	Upgrade directly to 4.4.0, 4.4.1,4.4.2.
4.4.0 4.4.1	Upgrade directly to 4.4.2

## Fixed issues

<b>Ticket number</b>	<b>Summary</b>
DB2-2004	Some DB2 VDB deletes/refresh when canceled leave database running on instance in strange state

## Unsupported DB2 features

- V2P
- Migrating a DB2 Database

## Db2 4.4.1 release notes

### What's new?

The DB2 plugin 4.4.1 release consists of only bug fixes.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

### Key:

Color	Supported?
Y	Yes
N	No

### Red Hat Enterprise Linux (RHEL)

Support for RHEL 8.x requires installing the `libcurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

### Db2 plugin support for below mentioned OS and Db2 versions

Supported OS version	Supported DBMS version		
	10.5	11.1	11.5
RHEL 6.9	Y	Y	N
RHEL 7.0	Y	Y	N
RHEL 7.1	Y	Y	N

6.0.17.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

 In the case of HADR, all source, staging, and target should be on the same fix pack version.

### Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 4.4.0
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0.
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1.
4.0.0 4.0.1	Upgrade directly to 4.1.0, 4.1.1, 4.1.2, 4.1.3, 4.2.0, 4.2.1, or 4.3.0, 4.3.1, 4.3.2, 4.4.0 and 4.4.1.
4.1.0 4.1.1 4.1.2 4.1.3	Upgrade directly to 4.2.0, 4.2.1, or 4.3.0, 4.3.1, 4.3.2, 4.4.0 and 4.4.1.
4.2.0 4.2.1	Upgrade directly to 4.3.0, or 4.3.1, 4.3.2, 4.4.0 and 4.4.1.
4.3.0 4.3.1 4.3.2 4.4.0	Upgrade directly to 4.4.1.

### Fixed issues

Ticket number	Summary
DB2-2044	Db2 plugin shouldn't implement Source sizing for VDB datasets
DB2-2045	VDB provisioning fails with SQL5153N due to LOGSECOND value
DB2-2053	Provisioning VDB failed during db2relocatedb due to multiple storage group paths

### Unsupported DB2 features

- V2P
- Migrating a DB2 Database

## Db2 4.4.0 release notes

### What's new?

#### DB2 pull performance optimization

The Db2 Plugin 4.4.0 version introduces the Pull Performance Optimization feature, which attempts to optimize the dSource workflows by allowing users to provide the degree of parallelisation to run the database restore operation. This feature allows users to ingest large databases in a faster way, provided that there are sufficient resources for Db2 plugin to implement this parallelisation in the operation.

#### Source sizing implementation on DSIL DB2 plugin

The source sizing feature aligns the data source experience with Delphix database standards that will improve your ingestion reporting experience on the per TB pricing model. This feature enables you to calculate the dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset.

For more details about this feature, see [Source Sizing Implementation for Datasets](#)

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

### Key:

 In the case of HADR, all source, staging, and target should be on the same fix pack version.

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

<b>Your version</b>	<b>Recommended upgrade path to Db2 4.3.1</b>
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0.
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1.
4.0.0 4.0.1	Upgrade directly to 4.1.0, 4.1.1, 4.1.2, 4.1.3, 4.2.0, 4.2.1, or 4.3.0, 4.3.1.
4.1.0 4.1.1 4.1.2 4.1.3	Upgrade directly to 4.2.0, 4.2.1, or 4.3.0, 4.3.1.
4.2.0 4.2.1	Upgrade directly to 4.3.0, or 4.3.1.

## Fixed issues

<b>Ticket number</b>	<b>Summary</b>
DB2-1973	Make sure the data paths are configured under "db_mount/DB_NAME" in staging push

## Db2 4.3.0 release notes

### New features

The DB2 plugin 4.3.0 introduces Staging push support for HADR dSources. You can now create and maintain dSources configured with HADR using the Staging push option.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

 • Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

#### Key:

Color	Supported?
<b>Y</b>	Yes
<b>N</b>	No

### Red Hat Enterprise Linux (RHEL)

Support for RHEL 8.x requires installing the `libcurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

<b>Your version</b>	<b>Recommended upgrade path to Db2 4.2.1</b>
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0, and follow the path below
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1, and follow the path below
4.0.0 4.0.1	Upgrade directly to 4.1.0, 4.1.1, 4.1.2, 4.1.3, or 4.2.0
4.1.0 4.1.1 4.1.2 4.1.3	Upgrade directly to 4.2.0, or 4.2.1

## Db2 4.2.0 release notes

### New features

#### Dsource snapshot with user-defined timestamp

The Db2 Plugin version 4.2.0 introduces the dsource snapshot with the user-defined timestamp feature. This feature enables the user to specify a timestamp during dSource snapshot so that staging will roll forward to the requested timestamp before performing the dSource snapshot. For more information, see [Linking a Db2 dSource](#)

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

 • Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

#### Key:

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions starting 2.1.0 till 2.7.3 are on extended support. Please contact Delphix Support for any queries.

Delphix Engine	3.0.0	3.0.1	3.0.2	3.1.0	3.1.1	4.0.0	4.0.1	4.1.0	4.1.1	4.1.2
6.0.0.x	Y	Y	Y	Y	Y	N	N	N	N	N

Delphix Engine	3.0.0	3.0.1	3.0.2	3.1.0	3.1.1	4.0.0	4.0.1	4.1.0	4.1.1	4.1.2
6.0.1.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.3.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.4.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.5.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.6.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.7.x	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.11.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.12.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 4.1.2
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0, and follow the path below
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1, and follow the path below

<b>Your version</b>	<b>Recommended upgrade path to Db2 4.1.2</b>
4.0.0 4.0.1	Upgrade directly to 4.1.0, 4.1.1, or 4.1.2

## Fixed issues

<b>Ticket number</b>	<b>Summary</b>
DB2-1826	Moved Staging Push redirect restore template out of the plugin and added contextual values to plugin logs
DB2-1796	Unable to get the complete content of redirect restore script in case the script size is more than 1MB
DB2-1824	DB2 VDB provisioning fails during relocateDB

## Db2 4.1.1 release notes

The Db2 Plugin version 4.1.1 does not include any new updates.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

#### Key:

Color	Supported?
Y	Yes
N	No

### Red Hat Enterprise Linux (RHEL)

Support for RHEL 8.x requires installing the `libcurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

#### Db2 plugin support for below mentioned OS and Db2 versions

Supported OS version	Supported DBMS version		
	10.5	11.1	11.5
RHEL 6.9	Y	Y	N
RHEL 7.0	Y	Y	N
RHEL 7.1	Y	Y	N
RHEL 7.2	Y	Y	N

	Supported DBMS version		
RHEL 7.3	Y	Y	N
RHEL 7.4	Y	Y	N
RHEL 7.5	Y	Y	N
RHEL 7.6	Y	Y	N
RHEL 7.7	N	Y	N
RHEL 7.8	N	Y	Y 6.0.5+
RHEL 8.2	N	N	Y
RHEL 8.6	N	N	Y 6.0.16+

Advanced interactive eExecutive (AIX)

Db2 plugin support for below mentioned OS and Db2 versions

6.0.11.x	Y	Y	Y	Y	Y	Y	Y	Y	Y

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 4.1.1
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0, and follow the path below
3.1.0 3.1.1	Upgrade to 4.0.0 or 4.0.1, and follow the path below
4.0.0 4.0.1	Upgrade directly to 4.1.0 or 4.1.1

## Db2 4.1.0 release notes

The Db2 Plugin version 4.1.0 includes the below improvements.

### Improvements

- **User-specified mount path For DB2 dSource**  
Users can specify the mount path of their choice on the target host to host the dSource dataset.
- **Staging push automation**  
A set of scripts is being provided that can be used to automate the steps related to the restore and rollforward operations on the dSource.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

 • Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

2.6.0 2.6.1	Upgrade to 2.7.0, and follow the paths below
2.7.0 2.7.1 2.7.2 2.7.3	Upgrade to 3.0.0, and follow the paths below
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0, and follow the path below
3.1.0 3.1.1	Upgrade directly to 4.0.0 or 4.0.1

#### Fixed issues

Db2 plugin version 4.0.1 contains the following fixed issue.

<b>Key</b>	<b>Summary</b>
DB2-1684	[Staging Push]Enable operation on dSource should generate the Restore and Rollforward template file if it is missing

## Db2 4.0.0 release notes

The Db2 Plugin version 4.0.0 includes the below improvements.

- Plugin generated log file will now be placed at <toolkit path>/<Delphix\_COMMON>/DB2\_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/logs/<instance name>.
- More user-friendly log statements will be printed.
- The logging.properties and advanceConf.config configuration files are now merged into the db2\_plugin.conf file.
- Dependency on redirect restore script to get the data path information is now removed.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition

3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0, and follow the path below
3.1.0 3.1.1	Upgrade directly to the latest version

## Db2 3.1.1 release notes

### New features

The Db2 Plugin version 3.1.1 introduces the support for full online backups, which are taken using the "exclude logs" syntax. This support is only applicable to the dSources created using the Backup and Logs ingestion mechanism on a single partition.

In Db2, users have the flexibility to exclude logs while taking the full online backups. The Db2 plugin will read the backup header from the user-provided backup file. The backup header is used to figure out whether the backup was taken using the "exclude logs" syntax or not. In case the plugin detects that it was taken using the "exclude logs" option, then the required changes will be made in the restore syntax.

### Migration and compatibility

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

3.0.0 3.0.1 3.0.2	Upgrade directly to the latest version
3.1.0	Upgrade directly to the latest version

## Db2 3.1.0 release notes

### New features

The Db2 Plugin version 3.1.0 introduces the **Staging Push** feature. This feature will allow users to control the restore of the staging database and they can also control the state of the restored staging database.

### Staging push

With the **Staging Push** feature, the restore and rollforward operations will be managed by the user from the CLI. During dSource creation (or RESYNC) the plugin will create an **empty mount point** and will provide a restore and rollforward template that will help the user to create the redirect restore script. Once the dSource will be ready then the user can perform restore and rollforward operations from CLI. The restore must be as per the plugin provided template. After the restore, the staging database should remain in rollforward pending state, and prior to the next snapshot, the user can do a rollforward to a specific Point-in-Time (by providing a timestamp to rollforward command) against the available archive logs.

### Migration and compatibility

#### Supported DBMS versions

- Db2 Enterprise Server Edition 10.5
- Db2 Advanced Enterprise Server Edition 10.5
- Db2 Enterprise Server Edition 11.1
- Db2 Advanced Enterprise Server Edition 11.1

#### Supported Operating Systems

#### Supported Db2 Database Editions

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions starting 2.1.0 till 2.7.3 are on extended support. Please contact Delphix Support for any queries.

Delphix Engine	3.0.0	3.0.1	3.0.2	3.1.0
6.0.0.x	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y
6.0.5.x	Y	Y	Y	Y

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 3.1.0
2.0.1	Upgrade to 2.1.0, and follow the paths below.
2.1.0	Upgrade to 2.2.1, and follow the paths below.
2.2.1	Upgrade to 2.3.0, and follow the paths below.
2.3.0	Upgrade to 2.4.0, and follow the paths below.

<b>Your version</b>	<b>Recommended upgrade path to Db2 3.1.0</b>
2.4.0 2.4.1 2.4.2	Upgrade to 2.5.1, and follow the paths below.
2.5.1	Upgrade to 2.6.0, and follow the paths below.
2.6.0 2.6.1	Upgrade to 2.7.0, and follow the paths below.
2.7.0 2.7.1 2.7.2 2.7.3	Upgrade to 3.0.0, and follow the paths below.
3.0.0 3.0.1 3.0.2	Upgrade to 3.1.0

## Db2 3.0.2 release notes

### New features

No new features. This release addresses a limitation in Db2 wherein the VDB can accept the connections when refresh, disable and delete Delphix operations are in process which eventually can corrupt the VDBs. This plugin version will reduce such occurrences by introducing maintenance window in these operations during which the VDB will not accept external connections.

### Migration and compatibility

#### Supported DBMS versions

- Db2 Enterprise Server Edition 10.5
- Db2 Advanced Enterprise Server Edition 10.5
- Db2 Enterprise Server Edition 11.1
- Db2 Advanced Enterprise Server Edition 11.1

#### Supported Operating Systems

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

### Key:

Color	Supported?
Y	Yes
N	No

### Red Hat Enterprise Linux (RHEL)

Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

Db2 plugin support for below mentioned OS and Db2 versions

Supported OS version	Supported DBMS version		
	10.5	11.1	11.5
RHEL 6.9	Y	Y	N
RHEL 7.0	Y	Y	N
RHEL 7.1	Y	Y	N
RHEL 7.2	Y	Y	N
RHEL 7.3	Y	Y	N
RHEL 7.4	Y	Y	N
RHEL 7.5	Y	Y	N
RHEL 7.6	Y	Y	N
RHEL 7.7	N	Y	N

AIX 7.2	Y	Y	Y

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions starting 2.1.0 till 2.7.3 are on extended support. Please contact Delphix Support for any queries.

Delphix Engine	3.0.0	3.0.1	3.0.2
6.0.0.x	Y	Y	Y
6.0.1.x	Y	Y	Y
6.0.1.x	Y	Y	Y
6.0.3.x	Y	Y	Y
6.0.4.x	Y	Y	Y

Plugin upgrade path

Use the table below to determine the most efficient upgrade path from your current version to the latest version of the Db2 Plugin.

Your version	Recommended upgrade path to Db2 3.0.2
2.0.1	Upgrade to 2.1.0, and follow the paths below.
2.1.0	Upgrade to 2.2.1, and follow the paths below.
2.2.1	Upgrade to 2.3.0, and follow the paths below.
2.3.0	Upgrade to 2.4.0, and follow the paths below.
2.4.0 2.4.1 2.4.2	Upgrade to 2.5.1, and follow the paths below.
2.5.1	Upgrade to 2.6.0, and follow the paths below.
2.6.0 2.6.1	Upgrade to 2.7.0, and follow the paths below.

<b>Your version</b>	<b>Recommended upgrade path to Db2 3.0.2</b>
2.7.0 2.7.1 2.7.2 2.7.3	Upgrade directly to the latest version
3.0.0 3.0.1	Upgrade directly to the latest version

## Db2 3.0.1 release notes

### New features

The Db2 Plugin version 3.0.1 fixes the bug wherein the jobs on UI hung intermittently due to a known IBM Db2 bug.

### Migration and compatibility

#### Supported DBMS versions

- Db2 Enterprise Server Edition 10.5
- Db2 Advanced Enterprise Server Edition 10.5
- Db2 Enterprise Server Edition 11.1
- Db2 Advanced Enterprise Server Edition 11.1

#### Supported Operating Systems

#### Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

#### Key:

Color	Supported?
Y	Yes
N	No

#### Red Hat Enterprise Linux (RHEL)

Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please reference [KBA 5622](#) for actionable steps.

2.7.0 2.7.1 2.7.2 2.7.3	Upgrade directly to the latest version
3.0.0	Upgrade directly to the latest version

## Db2 3.0.0 release notes

### New features

The Db2 Plugin version 3.0.0 introduces support to Db2 Database Partitioning Feature (DPF). This will help the customer to ingest the data to a staging dsources from a Db2 DPF enabled source.

### Database partitioning feature

Database Partitioning Feature (DPF) lets you partition your database across multiple servers. Since you can add new machines and spread your database across them, this allows users to scale their database. This means more CPUs, more memory, and more disks from each of the additional machines are available for your database. DPF can be used to manage large databases for a variety of use cases including data warehousing, data mining, online analytical processing (OLAP), or online transaction processing (OLTP) workloads.

DPF enables the user to divide a database into database partitions, a database partition is a part of a database that consists of its own data, indexes, configuration files, and transaction logs. Each database partition can be configured on the different physical server having its own set of computing resources, including CPU and storage. When a query is processed, the request is divided so each database partition processes the rows that it is responsible for. DPF can maintain consistent query performance as the table grows by providing the capability to add more processing power in the form of additional database partitions. This capability is often referred to as providing linear scalability using Db2's shared-nothing architecture.

DPF is an approach to sizing and configuring an entire database system. Please follow the recommended practices for optimal performance, reliability, and capacity growth. Please refer to IBM documentation of DPF for more details in [IBM knowledge center](#)

### Pipelining logic for implementing parallel restores

The plugin employs a parallel pipeline methodology so that the restore operation of non-catalog partitions can be performed in parallel in the Database Partitioning Feature (DPF). The number of parallel restores is determined by the value of "restorePipelineLimit" (default value is 10) in <Toolkit directory>/advanceConfFlag.conf. The parameter "restorePipelineLimit" is configurable by end-users. The plugin performs parallel restore for all non-catalog partitions. For e.g. If the total number of non-catalog partitions is 15, and the "restorePipelineLimit" parameter is set to 10, the first set of 10 restores will happen in parallel. The plugin will track the restore of each partition present in the pipe. Whenever a restore of a partition completes, it will move out from the pipe and a new partition will enter into that pipe. Thus, the plugin ensures that the pipe will always have the user-configured number of partitions being restored (default=10).

### Data synchronization

When "Customer Supplied Archive Logs" feature is used along with Db2 DPF feature, users will have to place the archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions then the user-provided log path will have folder names NODE0000 and NODE0001. Both the folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

### Advance configuration file

The advanced config file is created at <Toolkit directory>/advanceConfFlag.conf during discovery or environment refresh operation if the file does not pre-exist already. This file will have the following configurable parameters:

- **Common group (*notCommonGroupFlag*)**
  - This parameter sets the permission of "mnts", "logs" and "code" directories at <Toolkit dir>/DB2 location.
  - Set *notCommonGroupFlag* to *false*, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance users.

- Set *notCommonGroupFlag* to *true*, if you don't want to share any group between the primary environment user and the instance users.
- Once the necessary changes are made, refresh the environment in order to make the changes applicable.

By default, the *notCommonGroupFlag* parameter is not specified in the file. This means that the plugin implicitly assumes its value as false. The valid values for this parameter are true or false.

- **Allow source database on same instance (*allowSourceDBonSameInst*)**

By default, the DB2 Plugin restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database

For example:

- When provisioning a VDB from a VDB then source VDB is treated as the source database.
- When provisioning a VDB from a dSource then a staging database is treated as the source database.

Set *allowSourceDBonSameInst* to true, if the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database. The valid values for this parameter are true or false.

- **Restore pipeline limit (*restorePipelineLimit*)**

Db2 DPF Plugin performs restoration of all non-catalog partitions in parallel.

The parameter *restorePipelineLimit* allows the user to configure the number of partitions that should be restored in parallel. When the new *advanceConfFlag.conf* file is created during environment refresh or discovery operation, the default value of *restorePipelineLimit* is set to 10. If the *advanceConfFlag.conf* file is already present, the user will have to set the value of *restorePipelineLimit* parameter to the desired value. Valid value for this field is any positive integer.

A default config file created during discovery or environment refresh operation:

```
# If the user is not sharing a common group between primary environment user and
instance user.

# Then the user needs to set parameter notCommonGroupFlag as true.

# notCommonGroupFlag=true

# During provision operation check if instance contains a database name which is
identical to the source DB name used for provisioning operation.

# By default plugin will never allow creating a VDB on the instance where source
database (or other database which is identical in name with source DB) already
exists.

# If the user still wants to create a VDB on the instance which contains a database
name which is identical to the source DB name used for provisioning operation,

# then the user needs to set parameter allowSourceDBonSameInst as true.

# allowSourceDBonSameInst=true

# Limit for parallel restores

restorePipelineLimit=10
```

Migration and compatibility

Supported DBMS versions

- Db2 Enterprise Server Edition 10.5
- Db2 Advanced Enterprise Server Edition 10.5
- Db2 Enterprise Server Edition 11.1
- Db2 Advanced Enterprise Server Edition 11.1

Supported Operating Systems

Supported Db2 Database Editions

1. Enterprise Server Edition
2. Advanced Enterprise Server Edition
3. Advanced Edition
4. Standard Edition
5. For the supported Db2 versions, Delphix supports the corresponding Db2 Developer edition with Db2 plugin support

 • Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

- Db2 versions below 10.5 i.e (10.1, 9.8) are NOT supported by the plugin.
- Db2 supports only 64-bit OS

**Key:**

2.3.0	Upgrade to 2.4.0, and follow the paths below.
2.4.0 2.4.1 2.4.2	Upgrade to 2.5.1, and follow the paths below.
2.5.1	Upgrade to 2.6.0, and follow the paths below.
2.6.0 2.6.1	Upgrade to 2.7.0, and follow the paths below.
2.7.0 2.7.1 2.7.2 2.7.3	Upgrade to 3.0.0

## Known issues

Db2 plugin version 3.0.0 contains the following known issue:

<b>Key</b>	<b>Summary</b>	<b>Workaround / Comments</b>
DB2-1318	Jobs on UI might hang intermittently due to a known IBM Db2 bug	This issue will be only observed when multiple datasets jobs, within the same Db2 instance, will get executed at the same time.

## MySQL release notes

This section covers the following topics:

- [MySQL connector 4.0.0 release notes](#)
- [MySQL connector 3.0.0 release notes](#)
- [MySQL connector 2.1.0 release notes](#)
- [MySQL connector 2.0.26 release notes](#)
- [MySQL connector 1.0.0 release notes](#)

## MySQL connector 4.0.0 release notes

### What's new?

This connector version supports both the MySQL 8 Community Edition and Percona Server 8 along with MySQL 5.7 Community Edition and Percona Server 5.7 versions.

 To install the connector, refer to [MySQL Connector Installation](#)

### Fixed issues

Ticket number	Summary
MYSQL-138	The length of the MySQL Instance name has now been changed to support up to 255 characters.
MYSQL-81	Changed the command to change the root password which facilitates seamless working of the linking process.
MYSQL-72	Changed the commands to take backups as they were deprecated.

### Connector/Delphix engine compatibility

Delphix engine version	Connector version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0
6.0.4.0	Y	Y	N	N	N
6.0.5.0	Y	Y	N	N	N
6.0.6.0	Y	Y	N	N	N
6.0.7.0 to 6.0.16.0	N	N	Y	N	N
6.0.16 and above	N	N	Y	Y	Y

Supported DBMS version

Supported DBMS version	Connector version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0
MySQL Community 5.7.x	Y	Y	Y	Y	Y
Percona Server 5.7.x	N	N	N	Y	Y
MySQL Community 8.0.x	N	N	N	N	Y
Percona Server 8.0.x	N	N	N	N	Y

Supported operating system

Supported OS version	Connector version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0
RHEL 6.9 / 7.x	Y	Y	Y	Y	Y

 Future releases may add support for additional versions.

Connector upgrade path

To upgrade to the latest MySQL connector follow the recommended path below.

Your version	Recommended upgrade path to 4.0.0
2.0.26 2.0.33	Upgrade to 2.1.0 and follow the upgrade path below.
2.1.0	Upgrade to 3.0.0 and follow the upgrade path below.
3.0.0	Upgrade directly to 4.0.0.

Compatibility limitations

The following functionalities are not supported:

- Pull-based ingestion mechanism using Backup & Recovery.
- Pull-based ingestion mechanism using replication, except Binary Log ( binlog ).
- Pull-based ingestion mechanism using only backups is not supported.

- Partitioning of the databases.
- Selective replication of databases during dSource creation.
- Windows Operating System

Questions?

If you would like to see a new feature or supported platform reach out to us via the [Delphix Support](#) or the [Delphix Community Portal](#).

## MySQL connector 3.0.0 release notes

### What's new?

- The MySQL Connector version 3.0.0 has been enhanced for improved security and stability. We have added fixes for the following:
  - Dataset creation workflows can detect if the provided port number is already in use by an existing MySQL instance and notify the user.
  - Corrected the reported dSource and VDB statuses.
  - Fixed the **Snapshot with Parameters** functionality of the Manual Backup Ingestion to work smoothly and without errors.
  - Improved UI descriptions, UI and connector validations, and error messages.
- Added support for Percona Server for MySQL version 5.7 using Manual Backup Ingestion and Binary Log Replication ingestion models.
- Integrated support for MySQL and Percona Server for MySQL version 5.7 in a consolidated release stream. If you have installed divergent or custom branches of the MySQL connector you should look to migrate to this production stream. Future features and bugs will be resolved here.
- Implemented various security fixes.

 To install dxi, refer to [MySQL Connector Installation](#)

### Connector/Delphix engine compatibility

Delphix Engine version	Connector version			
	1.0.0	2.0.26	2.1.0	3.0.0
6.0.4.0	Y	Y	N	N
6.0.5.0	Y	Y	N	N
6.0.6.0	Y	Y	N	N
6.0.7.0 to 6.0.16	N	N	Y	N
6.0.16.0 and above	N	N	Y	Y

### Supported DBMS version

Supported DBMS version	Connector version			
	1.0.0	2.0.26	2.1.0	3.0.0
MySQL Community 5.7.x	Y	Y	Y	Y

Supported DBMS version	Connector version			
Percona Server 5.7.x	N	N	N	Y

Supported operating system

Supported OS version	Connector version			
	1.0.0	2.0.26	2.1.0	3.0.0
RHEL 6.9 / 7.x	Y	Y	Y	Y

 Future releases may add support for additional versions.

Connector upgrade path

To upgrade to the latest MySQL connector follow the recommended path below.

Your version	Recommended upgrade path to 3.0.0
2.0.26 2.0.33 2.1.0	Upgrade directly to 3.0.0.

Compatibility

- Pull ingestion mechanism using Backup & Recovery is not supported.
- Partitioning is not supported with this Connector release.
- Replication apart from binlog replication is not supported with Pull based ingestion mechanism of the connector.
- Selective replication of databases is not supported with this connector.

Questions?

If you have questions, bugs, or feature requests, contact us via [Delphix Support](#) or at [Delphix Community Portal](#).

## MySQL connector 2.1.0 release notes

### What's New?

The MySQL connector 2.1.0 release consists of security improvements.

 To install dxi, refer to [MySQL Connector Plugin Installation](#)

### Connector/Delphix engine compatibility

Delphix Engine version	Connector version		
	1.0.0	2.0.26	2.1.0
6.0.4	Y	Y	N
6.0.5	Y	Y	N
6.0.6	Y	Y	N
6.0.7 and above	N	N	Y

### Supported DBMS version

Supported DBMS version	Connector version		
	1.0.0	2.0.26	2.1.0
MySQL 5.7.x	Y	Y	Y

### Supported operating system

Supported OS version	Connector version		
	1.0.0	2.0.26	2.1.0
RHEL 6.9 / 7.x	Y	Y	Y

 Future releases may add support for additional versions.

### Connector upgrade path

To upgrade to the latest MySQL connector follow the recommended path below.

Your version	Recommended upgrade path to 2.1.0
2.0.26 2.0.33	Directly upgrade to 2.1.0

#### Compatibility

- Forward compatibility is not guaranteed between current version of MySQL connector and future versions of MySQL.
- MySQL connector may work with future RHEL/CentOS versions, but this is not guaranteed.

#### Questions?

If you have questions, bugs or feature requests reach out to us via the [MySQL Github](#) or at [Delphix Community Portal](#)

## MySQL connector 2.0.26 release notes

### What's new?

- **Selecting Databases:** Ability to select specific databases in the Source MySQL server when creating a dSource.
- **Delphix generated config file:** If a `my.cnf` file is not provided while creating a dSource, Delphix now creates one.
- **New Exit Return Codes:** MySQL connector 2.0.26 introduces more granular exit codes for errors.

 To install dxi, refer to [MySQL Connector Installation](#)

### Breaking changes

- **Removed Simple Tablespace Backup:** MySQL Plugin does not support the Simple Tablespace Backup option for Linking. This option may be supported in the future.

### Connector/Delphix engine compatibility

Delphix Engine version	Connector version	
	1.0.0	2.0.26
6.0.4 and above	Y	Y

### Supported DBMS version

Supported DBMS version	Connector version	
	1.0.0	2.0.26
MySQL 5.7.x	Y	Y

### Supported operating system

Supported OS version	Connector version	
	1.0.0	2.0.26
RHEL 6.9 / 7.x	Y	Y

 Future releases may add support for additional versions.

### Compatibility

- Forward compatibility is not guaranteed between current version of MySQL connector and future versions of MySQL.
- MySQL connector may work with future RHEL/CentOS versions, but this is not guaranteed.

### Questions?

If you have questions, bugs or feature requests reach out to us via the [MySQL Github](#) or at [Delphix Community Portal](#)

## MySQL connector 1.0.0 release notes

What's new?

MySQL Linux 1.0.0 release is the first release of the Delphix MySQL select connector.

 To install dxi, refer to [MySQL Connector Installation](#)

Connector/Delphix engine compatibility

<b>Delphix engine version</b>	<b>Connector version</b>
	<b>1.0.0</b>
6.0.4 and above	<b>Y</b>

## EBS 12.2 plugin 4.2.2 release notes

### What's new?

This is a patch release that contains fixes for a few bugs and enhancements.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

### Supported versions

- Oracle SI dbTechStack and Database

### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

#### Important notes

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

 For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#)

Plugin upgrade path for EBS 12.2 customers

 The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0/4.2.1/4.2.2 plugin for EBS 12.2 customers.

Existing EBS customers with different plugin version

Your version	Recommended upgrade path to 4.2.2
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.

Your version	Recommended upgrade path to 4.2.2
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.
4.2.0 4.2.1	Upgrade directly to version 4.2.2.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0 → 4.2.2.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0 → 4.2.2.

#### Fixed issues

Ticket number	Summary
EBS-1292, HF-1225	Plugin was using wrong Autoconfig script location if <code>`s_jdbc_connect_descriptor_generation`</code> was not true in <code>CONTEXT_FILE</code>
EBS-1280	Strong password check for WLS password as per EBS requirement
EBS-1169	Source apps password file removed from all remote hosts to improve security.
EBS-1285	Implementation of AppData Bundle Redaction parameters in EBS plugin
EBS-1256	Expect utility availability is checked on additional application nodes for smooth multi-node provisioning.

#### Unsupported EBS versions and features

- Custom SSL certificates enabled Environment
- V2P

## EBS 12.2 plugin 4.2.1 release notes

### What's new?

This is a patch release that contains fixes for a few bugs.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

### Supported versions

- Oracle SI dbTechStack and Database

### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

 For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#)

Plugin upgrade path for EBS 12.2 customers

The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0/4.2.1 plugin for EBS 12.2 customers.

## Existing EBS customers with different plugin version

Your version	Recommended upgrade Path to 4.2.1
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.
4.2.0	Upgrade directly to version 4.2.1.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0 → 4.2.1.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0 → 4.2.1.

## Fixed issues

Ticket number	Summary
EBS-1265	Hooks utility fails to get the short hostname if target server is SunOS SOLARIS
EBS-1278	Handling detach ORACLE HOME when inventory.xml has multiple HOMES
EBS-1259	If someone is upgrading from Lua(2.0.x) to vSDK version(4.x.x) and using oracle 11g, the end user will not be able to take snapshot in Delphix Engine
EBS-1275	Fix lsof issue in Solaris and Linux

#### Unsupported EBS versions and features

- Support SSL enabled Environment
- V2P

## EBS 12.2 plugin 4.2.0 release notes

### What's new?

The EBS Plugin version 4.2.0 introduces the EBS Database Port Customization feature.

### EBS database port customization

This feature supports the provisioning of VDBs in EBS dbTechStack & AppsTier plugins to run on a customized port. Using this feature you can provision database binaries(ORACLE\_HOME) cloning and listener process to run on a custom DB port and Application tier to connect to that port. The EBS Database Port Customization provide flexibility to choose the desired port for running the Delphix-created VDBs & listeners.

 This feature is supported only in Oracle 19c Database.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

- Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

 For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#)

## EBS 12.2 plugin 4.1.0 release notes

### What's new?

The EBS Plugin version 4.1.0 introduces the hooks utility feature and also addresses the handling of an additional prompt for ISG Datasource password during AppsTier provisioning operation for `adcfgclone` execution.

### Hooks utility feature

This feature provides flexibility to end-users where they can provide a command with configure/pre-snapshot as an option in configuring and pre-snapshot hooks during DB provisioning. This is a huge improvement in terms of user experience in comparison to the conventional approach where end-users had to add entire content (by copying it from the user documentation) into the various hooks. The hooks utility also manages the logs for hooks execution; it'll be helpful in scenarios where end users want to track the hook execution. We have not removed or restricted the existing approach of providing hooks content from user documentation, the hooks utility can be used as an alternative to the existing approach.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

Plugin upgrade path for EBS 12.2 customers

The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0 plugin for EBS 12.2 customers.

## Existing EBS customers with different plugin version

Your version	Recommended upgrade path to 4.2.0
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

## Unsupported EBS versions and features

- Support SSL enabled Environment
- V2P

## EBS 12.2 plugin 3.0.3 release notes

### What's new?

This is a patch release that aims to provide the bug fixes that are listed in the Fixed Issues section at the end of this page.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#)

Plugin upgrade path for EBS 12.2 customers

The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0 plugin for EBS 12.2 customers.

Existing EBS customers with different plugin version

Your version	Recommended upgrade path to 4.2.0
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

Unsupported EBS versions and features

- Support SSL enabled environment
- V2P

Fixed issues

Key	Summary
EBS-1027	EBS 12.2 Plugin will validate user-provided ORACLE_HOME during DbTier provisioning
EBS-1028	Enhancements identified in dbTechStack code
EBS-1038	Fix shellchecks warnings/errors in hooks and sudoers entry for target dbtier
EBS-1066	Make the check stricter for listener process in DBTechStack status module and fix shellchecks

## EBS 12.2 plugin 3.0.2 release notes

### What's new?

This is a patch release that aims to provide the following updates to EBS 12.2 plugin.

- Updated Hooks for 19c MT low and high privileged users.
- Fixed an issue where 19c DBTechStack provision fails during `adcfgclone` with java exception.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#)

Plugin upgrade path for EBS 12.2 customers

The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0 plugin for EBS 12.2 customers.

Existing EBS customers with different plugin version

Your version	Recommended upgrade path to 4.2.0
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

Unsupported EBS versions and features

- Support SSL enabled Environment
- V2P

Fixed issues

Key	Summary
EBS-890	19C DBTechStack provision fails during adcfgclone with java exception

## EBS 12.2 plugin 3.0.1 release notes

### What's new?

This is a patch release that aims to provide the following updates to EBS 12.2 plugin.

- Added support for RHEL 8.3
- Updated Hooks for 19c MT low and high privileged users.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

- Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.
- Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL)
- 64-bit OS support only

For specific plugin version release notes, see [EBS 12.2 Plugin Release Notes](#)

Plugin upgrade path for EBS 12.2 customers

The plugin versions for AppsTier and DB Tech Stack need to be the same, at installation and through the upgrade. Installation and usage of different versions of these plugins are not supported and may encounter operational issues.

New plugin installation for EBS customers

Upload 3.0.0/3.0.1/3.0.2/3.0.3/4.0.2/4.1.0/4.2.0 plugin for EBS 12.2 customers.

Existing EBS customers with different plugin version

Your version	Recommended upgrade path to 4.2.0
1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1 and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, 3.0.1, 3.0.2, or 3.0.3 the latest plugin version.

Your version	Recommended upgrade path to 4.2.0
3.0.0 3.0.1 3.0.2 3.0.3	Upgrade directly to version 4.0.2.
4.0.2	Upgrade directly to version 4.1.0.
4.1.0	Upgrade directly to version 4.2.0.

For example, upgrade path for EBS 12.2 customer with existing plugin version 1.8.2 who wants to upgrade to 3.0.0 plugin version : 1.8.2 or 1.8.3 or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2, or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

- Customers should skip a minor plugin 1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on plugin version 1.8.2, the plugin upgrade path will be : 1.8.2 → 2.0.0 or 2.0.1 → 3.0.0, 3.0.1, 3.0.2 or 3.0.3 → 4.0.2 → 4.1.0 → 4.2.0.

#### Unsupported EBS versions and features

- Support SSL enabled environment
- V2P

#### Known issues

Key	Summary
EBS-836	"ebs_<PDB_SID>" listener services are getting disappeared on VDB stop/start. As a workaround, a new <a href="#">Third Configure Clone Hook</a> has been added.

## EBS 12.2 plugin 3.0.0 release notes

### **vN**New features

EBS Plugin version 3.0.0 aims to support Oracle 19c MT architecture. Moreover, a new field has been added on the provisioning UI. This will provide the flexibility to the end-user to provide the maximum time allowed to virtualize the application tier.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)
- Oracle19c MT (Minimum DB version supported 19.3.0.0)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

#### Supported operating systems

- Linux – SLES 9, 10, 11; RHEL 5, 6, 7, OL 5, 6
- Solaris – SPARC 9, 10, 11

#### Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below. For plugin/engine compatibility of all the released plugin versions, see [EBS Matrix](#)

#### For EBS 12.2 customers:

Delphix engine	EBS_3.0.0
5.3.0.0	<b>N</b>
5.3.1.0	<b>N</b>
5.3.2.0	<b>N</b>

<b>Delphix engine</b>	<b>EBS_3.0.0</b>
5.3.3.0	<b>N</b>
5.3.4.0	<b>N</b>
5.3.5.0	<b>N</b>
5.3.6.0	<b>N</b>
5.3.7.0	<b>N</b>
5.3.8.0-5.3.8.1	<b>N</b>
5.3.9.0	<b>N</b>
6.0.0.0	<b>N</b>
6.0.1.0	<b>N</b>
6.0.2.0	<b>N</b>
6.0.3.0	<b>N</b>
6.0.4.0	<b>N</b>
6.0.5.0	<b>N</b>
6.0.6.0	<b>N</b>
6.0.7.0	<b>N</b>
6.0.8.0	<b>N</b>
6.0.9.0	<b>Y</b>

#### Plugin upgrade path

Path A - New plugin installation for EBS customers:

- Upload 3.0.0 plugin for EBS 12.2 customers

Path B - Existing EBS customers with different plugin version:

**For EBS 12.2 customers:**

Your version	Recommended upgrade path to 3.0.0
1.0.0	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0 1.3.1	Upgrade to 1.4.0 and follow the upgrade path below.
1.4.0	Upgrade to 1.5.0 and follow the upgrade path below.
1.5.0	Upgrade to 1.6.0 and follow the upgrade path below.
1.6.0	Upgrade to 1.7.0 and follow the upgrade path below.
1.7.0	Upgrade to 1.8.0, 1.8.1, 1.8.2, 1.8.3, or 1.8.4 and follow the upgrade path below.
1.8.0 1.8.1 1.8.2 1.8.3 1.8.4	Upgrade to 2.0.0 or 2.0.1, and follow the upgrade path below.
2.0.0 2.0.1	Upgrade to 3.0.0, the latest plugin version.

**Example :** Upgrade path for EBS 12.2 customer with existing Plugin version 1.1.0 who wants to upgrade to 3.0.0  
 Plugin version : 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0.

- Customers should skip a minor Plugin 1.3.1 and 1.8.1/1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on Plugin version 1.3.1, the plugin upgrade path will be : 1.3.1 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4 → 2.0.0 or 2.0.1 → 3.0.0

**Key points:**

- Customers can skip a patch plugin release upgrade if they intend to upgrade their plugin to a higher version. The Delphix Engine simply ignores patch versions when handling plugin upgrade logic. It only validates the major/minor plugin version during the plugin upgrade.

## Unsupported EBS versions and features

- SSL enabled environment
- V2P

## Known issues

Key	Summary
EBS-836	"ebs_<PDB_SID>" listener services are getting disappeared on VDB stop/start. As a workaround, a new <a href="#">configure clone hook</a> has been added.

## Fixed issues

EBS plugin version 3.0.0 contains the following bug fixes.

Key	Summary
EBS-767	EBS appsTier linking failed while identifying Delta patch level information from low-privilege OS user
EBS-779	Continued timeouts - toolkit.ebs122-app-1-8-2.errorTimeout {admanagedsvrctl}
EBS-787	Toolkit should perform prior dependency/pre-requisite check in target host before starting to provision dBtechStack and Appstier
EBS-788	Error not being shown to the customer
EBS-798	GUI shows vfiles ORACLE_HOME as stopped however it is not
EBS-778	Expect timeout set to 8 hours which is too short
EBS-798	GUI shows vfiles ORACLE_HOME as stopped however it is not
EBS-816	EBS 12.2 disable Appstier vdb failed with Delphix cannot stop all processes under /u01/oracle/VIS on host

## EBS 12.2 plugin 2.0.1 release notes

### New features

EBS Plugin version 2.0.1 aims to successfully stop application services while provisioning or refresh operation. Hence, creating successful snapshots.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

#### Supported operating systems

- Linux – SLES 9, 10, 11; RHEL 5, 6, 7, OL 5, 6
- Solaris – SPARC 9, 10, 11
- Advanced Interactive eXecutive (AIX) – See the matrix at the bottom of the [Oracle E-Business Suite Support Matrix](#)

#### Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below. For plugin/engine compatibility of all the released plugin versions, see [EBS Matrix](#)

#### For EBS 12.2 customers:

Delphix engine	EBS_2.0.1
5.3.0.0	N
5.3.1.0	Y
5.3.2.0	Y

Delphix engine	EBS_2.0.1
5.3.3.0	Y
5.3.4.0	Y
5.3.5.0	Y
5.3.6.0	Y
5.3.7.0	Y
5.3.8.0-5.3.8.1	Y
5.3.9.0	Y
6.0.0.0	Y
6.0.1.0	Y
6.0.2.0	Y
6.0.3.0	Y
6.0.4.0	Y
6.0.5.0	Y
6.0.6.0	Y
6.0.7.0	Y
6.0.8.0	Y

#### Plugin upgrade path

Path A - New plugin installation for EBS customers:

- Upload 2.0.1 plugin for EBS 12.2 customers

Path B - Existing EBS customers with different plugin version:

**For EBS 12.2 customers:**

<b>Your version</b>	<b>Recommended upgrade path to 2.0.1</b>
1.0.0	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0 1.3.1	Upgrade to 1.4.0 and follow the upgrade path below.
1.4.0	Upgrade to 1.5.0 and follow the upgrade path below.
1.5.0	Upgrade to 1.6.0 and follow the upgrade path below.
1.6.0	Upgrade to 1.7.0 and follow the upgrade path below.
1.7.0	Upgrade to 1.8.0, 1.8.1, 1.8.2, 1.8.3, or 1.8.4 and follow the upgrade path below.
1.8.0 to 1.8.4	Upgrade to 2.0.0 or 2.0.1, the latest plugin version.

**Example :** Upgrade path for EBS 12.2 customer with existing Plugin version 1.1.0 who wants to upgrade to 2.0.0 or 2.0.1 Plugin version : 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4 → 2.0.0 or 2.0.1.

- Customers should skip a minor Plugin 1.3.1 and 1.8.1/1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on Plugin version 1.3.1, the plugin upgrade path will be : 1.3.1 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4 → 2.0.0 or 2.0.1.

#### Key points:

- Customers can skip a patch plugin release upgrade if they intend to upgrade their plugin to a higher version. The Delphix Engine simply ignores patch versions when handling plugin upgrade logic. It only validates the major/minor plugin version during the plugin upgrade.

#### Unsupported EBS versions and features

- SSL enabled environment
- V2P

#### Known issues

N/A

#### Fixed issues

EBS plugin version 2.0.1 contains the following features and bug fixes:

<b>Key</b>	<b>Summary</b>
EBS-783	Provisioning VDB from Appstier dSource fails with adpreclone connection with Oracle WebLogic Administration Server

## EBS 12.2 plugin 2.0.0 release notes

### New features

EBS Plugin version 2.0.0 aims to implement Sudo Privileges feature for both EBS 12.2 Database Tier and Application Tier.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

#### Supported operating systems

- Linux – SLES 9, 10, 11; RHEL 5, 6, 7, OL 5, 6
- Solaris – SPARC 9, 10, 11
- Advanced Interactive eXecutive (AIX) – See the matrix at the bottom of the [Oracle E-Business Suite Support Matrix](#)

#### Plugin/Delphix engine compatibility

The Plugin should be installed on compatible Delphix Engines per the table below. For plugin/engine compatibility of all the released plugin versions, see [EBS Matrix](#)

#### For EBS 12.2 customers:

Delphix engine	EBS_2.0.0
5.3.0.0	N
5.3.1.0	Y
5.3.2.0	Y

Delphix engine	EBS_2.0.0
5.3.3.0	Y
5.3.4.0	Y
5.3.5.0	Y
5.3.6.0	Y
5.3.7.0	Y
5.3.8.0-5.3.8.1	Y
5.3.9.0	Y
6.0.0.0	Y
6.0.1.0	Y
6.0.2.0	Y
6.0.3.0	Y
6.0.4.0	Y
6.0.5.0	Y
6.0.6.0	Y
6.0.7.0	Y
6.0.8.0	Y

#### Plugin upgrade path

Path A - New plugin installation for EBS customers:

- Upload 2.0.0 plugin for EBS 12.2 customers

Path B - Existing EBS customers with different plugin version:

**For EBS 12.2 customers:**

<b>Your version</b>	<b>Recommended upgrade path to 2.0.0</b>
1.0.0	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0 1.3.1	Upgrade to 1.4.0 and follow the upgrade path below.
1.4.0	Upgrade to 1.5.0 and follow the upgrade path below.
1.5.0	Upgrade to 1.6.0 and follow the upgrade path below.
1.6.0	Upgrade to 1.7.0 and follow the upgrade path below.
1.7.0	Upgrade to 1.8.0, 1.8.1, 1.8.2, 1.8.3, or 1.8.4 and follow the upgrade path below.
1.8.0 to 1.8.4	Upgrade to 2.0.0, the latest plugin version.

**Example :** Upgrade path for EBS 12.2 customer with existing Plugin version 1.1.0 who wants to upgrade to 2.0.0  
 Plugin version : 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4 → 2.0.0.

- Customers should skip a minor Plugin 1.3.1 and 1.8.1/1.8.2/1.8.3/1.8.4 version upgrade.
- If EBS 12.2 customers are on Plugin version 1.3.1, the plugin upgrade path will be : 1.3.1 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4 → 2.0.0.

#### Key points:

- Plugin 2.0.0 supports IDEA-1072: Delphix OS account ("delphix\_os") on source/target servers should obtain privileges only through "sudo".
- Customers can skip a patch plugin release upgrade if they intend to upgrade their plugin to a higher version. The Delphix Engine simply ignores patch versions when handling plugin upgrade logic. It only validates the major/minor plugin version during the plugin upgrade.

#### Unsupported EBS versions and features

- SSL enabled environment
- V2P

#### Known issues

N/A

#### Fixed issues

EBS plugin version 1.8.4 contains the following features and bug fixes:

<b>Key</b>	<b>Summary</b>
EBS-757	EBS plugin should check for data accessibility during status check

## EBS 12.2 plugin 1.8.4 release notes

### New features

EBS Plugin version 1.8.4 aims to implement Weblogic password complexity validation as per the Oracle standards.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)

 Oracle does not yet support the multi-tenant option for E-Business Suites, so Delphix cannot support this either.

### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

### Supported operating systems

- Linux – SLES 9, 10, 11; RHEL 5, 6, 7, OL 5, 6
- Solaris – SPARC 9, 10, 11
- Advanced Interactive eXecutive (AIX) – See the matrix at the bottom of the [Oracle E-Business Suite Support Matrix](#)

### Plugin/Delphix engine compatibility

The Plugin should be installed on compatible Delphix Engines per the table below. For plugin/engine compatibility of all the released plugin versions, see [EBS Matrix](#)

#### For EBS 12.2 customers:

Delphix engine	EBS_1.8.4
5.3.0.0	<b>N</b>

<b>Delphix engine</b>	<b>EBS_1.8.4</b>
5.3.1.0	Y
5.3.2.0	Y
5.3.3.0	Y
5.3.4.0	Y
5.3.5.0	Y
5.3.6.0	Y
5.3.7.0	Y
5.3.8.0-5.3.8.1	Y
5.3.9.0	Y
6.0.0.0	Y
6.0.1.0	Y
6.0.2.0	Y
6.0.3.0	Y
6.0.4.0	Y
6.0.5.0	Y
6.0.6.0	Y
6.0.7.0	Y
6.0.8.0	Y

Plugin upgrade path

Path A - New plugin installation for EBS customers:

- Upload 1.8.4 plugin for EBS 12.2 customers

Path B - Existing EBS customers with different plugin version:

**For EBS 12.2 customers:**

<i><b>Your version</b></i>	<i><b>Recommended upgrade path to 1.8.3</b></i>
1.0.0	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0 1.3.1	Upgrade to 1.4.0 and follow the upgrade path below.
1.4.0	Upgrade to 1.5.0 and follow the upgrade path below.
1.5.0	Upgrade to 1.6.0 and follow the upgrade path below.
1.6.0	Upgrade to 1.7.0 and follow the upgrade path below.
1.7.0	Upgrade to 1.8.0, 1.8.1, 1.8.2, 1.8.3, or 1.8.4 and follow the upgrade path below.

Example : Upgrade path for EBS 12.2 customer with existing Plugin version 1.1.0 who wants to upgrade to 1.8.x  
 Plugin version : 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4

- Customers should skip a minor Plugin 1.3.1 version upgrade.
- If EBS 12.2 customers are on Plugin version 1.3.1, the plugin upgrade path will be : 1.3.1 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, 1.8.3. or 1.8.4

Key points:

- Plugin 1.8.4 is a patch release
- Customers can skip a patch plugin release upgrade if they intend to upgrade their plugin to a higher version. The Delphix Engine simply ignores patch versions when handling plugin upgrade logic. It only validates the major/minor plugin version during the plugin upgrade.

Unsupported EBS versions and features

- Sudo Privilege Plugin for EBS 12.2 release
- Support SSL enabled Environment
- V2P

Known issues

N/A

Fixed Issues

EBS plugin version 1.8.4 contains the following features and bug fixes:

<b>Key</b>	<b>Summary</b>
EBS-712	WLS Password Complexity Issue - Merge ESCL_2983 into EBS 12.2 Plugin.
EBS-713	Multi-line support for SQL query O/P - merge ESCL-2988 into EBS 12.2 Plugin.

## EBS 12.2 plugin 1.8.3 release notes

### New features

EBS Plugin version 1.8.3 introduces a new feature while refreshing EBS appsTier where a Pre Refresh hook will help in aborting concurrent manager services and reduce the time taken to gracefully stop the EBS application.. The password required to execute the same will be pulled from a text file present on the target appsTier host which will be created automatically during appsTier provisioning.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)

 Oracle does not yet support the multi-tenant option for E-Business Suites, so Delphix cannot support this either.

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

#### Supported operating systems

- Linux – SLES 9, 10, 11; RHEL 5, 6, 7, OL 5, 6
- Solaris – SPARC 9, 10, 11
- Advanced Interactive eXecutive (AIX) – See the matrix at the bottom of the [Oracle E-Business Suite Support Matrix](#)

#### Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below. For plugin/engine compatibility of all the released plugin versions, see [EBS Matrix](#)

#### **For EBS 12.2 customers:**

<b>Delphix engine</b>	<b>EBS_1.8.3</b>
5.3.0.0	<b>N</b>
5.3.1.0	<b>Y</b>
5.3.2.0	<b>Y</b>
5.3.3.0	<b>Y</b>
5.3.4.0	<b>Y</b>
5.3.5.0	<b>Y</b>
5.3.6.0	<b>Y</b>
5.3.7.0	<b>Y</b>
5.3.8.0-5.3.8.1	<b>Y</b>
5.3.9.0	<b>Y</b>
6.0.0.0	<b>Y</b>
6.0.1.0	<b>Y</b>
6.0.2.0	<b>Y</b>
6.0.3.0	<b>Y</b>
6.0.4.0	<b>Y</b>
6.0.5.0	<b>Y</b>
6.0.6.0	<b>Y</b>
6.0.7.0	<b>Y</b>
6.0.8.0	<b>Y</b>

Plugin upgrade path

Path A - New plugin installation for EBS customers:

- Upload 1.8.3 plugin for EBS 12.2 customers

Path B - Existing EBS customers with different plugin version:

**For EBS 12.2 customers:**

<i><b>Your version</b></i>	<i><b>Recommended upgrade path to 1.8.3</b></i>
1.0.0	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0 1.3.1	Upgrade to 1.4.0 and follow the upgrade path below.
1.4.0	Upgrade to 1.5.0 and follow the upgrade path below.
1.5.0	Upgrade to 1.6.0 and follow the upgrade path below.
1.6.0	Upgrade to 1.7.0 and follow the upgrade path below.
1.7.0	Upgrade to 1.8.0, 1.8.1, 1.8.2, or 1.8.3 and follow the upgrade path below.

Example : Upgrade path for EBS 12.2 customer with existing Plugin version 1.1.0 who wants to upgrade to 1.8.x  
 Plugin version : 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, or 1.8.3.

- Customers should skip a minor Plugin 1.3.1 version upgrade.
- If EBS 12.2 customers are on Plugin version 1.3.1, the plugin upgrade path will be : 1.3.1 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1, 1.8.2, or 1.8.3.

Key points:

- Plugin 1.8.3 is a patch release
- Customers can skip a patch plugin release upgrade if they intend to upgrade their plugin to a higher version. The Delphix Engine simply ignores patch versions when handling plugin upgrade logic. It only validates the major/minor plugin version during the plugin upgrade.

Unsupported EBS versions and features

- Sudo Privilege Plugin for EBS 12.2 release
- Support SSL enabled Environment
- V2P
- BYOOJ

## Known issues

EBS plugin version 1.8.3 contains the following known issues :

<b>Key</b>	<b>Summary</b>
Key	Summary
EBS-692	EBS link operation fails when source EBS environment is linked with BYOOJ
DLPX-69617	OperationRunnerImpl incorrectly assumes toolkit JDK always exists

## Fixed issues

EBS plugin version 1.8.3 contains the following features and bug fixes:

<b>Key</b>	<b>Summary</b>
EBS-663	Abort EBS ConcMgr services before stopping EBS appsTier services during refresh.

## EBS 12.2 plugin 1.8.2 release notes

### New features

EBS Plugin version 1.8.2 introduces a new feature where the user will not need to specify the source apps schema password in EBS DB hooks provision wizard. This password can now be pulled from a text file present on the target DB host which will be created automatically during DBTechStack provisioning.

### Plugin installation

Plugins to support EBS virtualization are not automatically included in the Virtualization Engine deployment and can be installed by the end-user after uploading the plugin through the Manage > Plugin screen.

### Migration and compatibility

#### Supported versions

Oracle SI dbTechStack and Database

#### EBS 12.2

- Oracle11gR2 (Minimum DB version supported 11.2.0.4)
- Oracle12cR1 (Minimum DB version supported 12.1.0.2)

 Oracle does not yet support the multi-tenant option for E-Business Suites, so Delphix cannot support this either.

#### Oracle EBS appsTier

- Single-node appsTier
- Multi-node appsTier with shared APPL\_TOP

 The Delphix Engine does not provide support for provisioning a multi-node appsTier where the APPL\_TOP is not shared between nodes.

#### Supported operating systems

- Linux – SLES 9, 10, 11; RHEL 5, 6, 7, OL 5, 6
- Solaris – SPARC 9, 10, 11
- Advanced Interactive eXecutive (AIX) – See the matrix at the bottom of [Oracle E-Business Suite Support Matrix](#)

#### Plugin/Delphix engine compatibility

The Plugin should be installed on compatible Delphix Engines per the table below. For plugin/engine compatibility of all the released plugin versions, see [EBS Matrix](#)

#### For EBS 12.2 customers:

Delphix engine	EBS_1.8.2
5.3.0.0	<b>N</b>

<b>Delphix engine</b>	<b>EBS_1.8.2</b>
5.3.1.0	Y
5.3.2.0	Y
5.3.3.0	Y
5.3.4.0	Y
5.3.5.0	Y
5.3.6.0	Y
5.3.7.0	Y
5.3.8.0-5.3.8.1	Y

6.0.3.0	Y
6.0.4.0	Y
6.0.5.0	Y
6.0.6.0	Y
6.0.7.0	Y
6.0.8.0	Y

Plugin upgrade path

Path A - New plugin installation for EBS customers:

- Upload 1.8.2 plugin for EBS 12.2 customers

Path B - Existing EBS customers with different plugin version:

**For EBS 12.2 customers:**

<i>Your version</i>	<i>Recommended Upgrade Path to 1.8.2</i>
1.0.0	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0 1.3.1	Upgrade to 1.4.0 and follow the upgrade path below.
1.4.0	Upgrade to 1.5.0 and follow the upgrade path below.
1.5.0	Upgrade to 1.6.0 and follow the upgrade path below.
1.6.0	Upgrade to 1.7.0 and follow the upgrade path below.
1.7.0	Upgrade to 1.8.0, 1.8.1, or 1.8.2 and follow the upgrade path below.

Example : Upgrade path for EBS 12.2 customer with existing Plugin version 1.1.0 who wants to upgrade to 1.8.1  
 Plugin version : 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1 or 1.8.2

- Customers should skip a minor Plugin 1.3.1 version upgrade.
- If EBS 12.2 customers are on Plugin version 1.3.1, the plugin upgrade path will be : 1.3.1 → 1.4.0 → 1.5.0 → 1.6.0 → 1.7.0 → 1.8.0 or 1.8.1 or 1.8.2

Key points:

- Plugin 1.8.2 is a patch release that will support EBS-597 Delphix Hooks Password-Storing Apps password to file for EBS appsTier.
- Customers can skip a patch plugin release upgrade if they intend to upgrade their plugin to a higher version. The Delphix Engine simply ignores patch versions when handling plugin upgrade logic. It only validates the major/minor plugin version during the plugin upgrade.

Unsupported EBS versions and features

- Sudo Privilege Plugin for EBS 12.2 release
- Support SSL enabled Environment
- V2P
- BYOOJ

## Fixed issues

EBS plugin version 1.8.2 contains the following features and bug fixes:

<b>Key</b>	<b>Summary</b>
EBS_566	Display port pool number in the error toolkit.ebs122-app-1-7-0.portPoolNotFreeError.
EBS-597	Delphix Hooks Password-Storing Apps password to file for EBS appsTier

## Known issues

<b>Key</b>	<b>Summary</b>
EBS-692	EBS link operation fails when source EBS environment is linked with BYOOJ
DLPX-69617	OperationRunnerImpl incorrectly assumes toolkit JDK always exists

## PostgreSQL release notes

- [PostgreSQL 1.4.2 release notes](#)
- [PostgreSQL 1.4.1 release notes](#)
- [PostgreSQL 1.4.0 release notes](#)

## PostgreSQL 3.2.0 release notes

What's new?

Enhancement to external backup mechanism

With the 3.2.0 release, while using External Backup Mechanism it is now **not** mandatory for you to provide the backups as ZIP files. This enhancement thus removes the mandatory requirement of `pg_basebackup` to be encapsulated in `PostgreSQL_T<YYYYMMDD>.zip` format. You can now store the backups (as tars) on the staging server directly, without providing the backups as ZIP files (reducing the time spent on creating ZIP files) using the following additional ways:

- Within folders (named `PostgreSQL_T<YYYYMMDDhhmmss>`) created inside the provided backup path.
- Within the provided backup path - `PostgreSQL Backup File Path`

Switching to the new mechanism is easy, just store the full backup within the same backup path and run a resync operation.

Note

The plugin still supports the usage of zip files.

For more information, see [Creating a dSource with External Backups using WAL Logs](#)

Introducing a LOG\_LEVEL parameter in the PostgreSQL plugin configuration

PostgreSQL plugin supports remote side logging, with all plugin logs available within the scratch path on the remote host (`<tookit_path>/Delphix_COMMON_*/plugin/postgres-vsdk_*`). You can tweak the log parameters related to log rotation within the plugin configuration file called `dlpx_postgres_config.ini`. The 3.2.0 version, introduces a new parameter called **LOG\_LEVEL**, with the capability of handling the amount of logs being generated on the remote host. Accepted values are **DEBUG, INFO, WARNING, and ERROR**, with **INFO** being the default value.

**Key:**

Color	Supported?

where **x** represents the minor version.

- ⚠️ All the available PostgreSQL Database minor versions will be supported for the above-mentioned major versions.
- SUSE 15SP3 is supported on Power 8 hardware.
- Make sure to install libncurses.5 or libncurses.6 in the host, for supporting RHEL and SUSE. You can refer [KBA 5622](#) for actionable steps.

Cloud vendors

Supported cloud vendors	PostgreSQL 11	PostgreSQL 12	PostgreSQL 13
Amazon RDS PostgreSQL	Y	Y	Y
Amazon Aurora PostgreSQL	Y	Y	Y

For this release, only a single DB ingestion feature is supported for the Amazon RDS/Aurora PostgreSQL through the pg\_dump/pg\_restore method.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

- ⚠️ The plugin versions from 1.0.1 till 1.3.2 are currently in extended support. Please reach out to Delphix customer support for any queries.

- ⚠️ Currently, PostgreSQL Plugin 1.4.1 is not supported on SUSE 12.x.

Delphix Engine Version	Plugin Version												
	1.4.0	1.4.1	1.4.2	1.4.3	1.4.4	1.5.0	1.5.1	2.0.0	2.1.0	2.1.1	3.0.0	3.1.0	3.2.0

9.0.0.x	N	N	N	N	N	N	N	Y	Y	Y	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

## Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 3.2.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 3.2.0
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.
1.5.0 1.5.1	Upgrade directly to 2.0.0 and follow the upgrade path below.
2.0.0 2.1.0	Upgrade directly to 3.0.0.
3.0.0 3.1.0	Upgrade directly to the latest version 3.2.0.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0 → 3.2.0

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0 → 3.2.0

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0 → 3.2.0

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0 → 3.2.0

For PostgreSQL customer with plugin version 2.0.0

Plugin upgrade path: 2.0.0/2.1.0 → 3.0.0 → 3.1.0 → 3.2.0

### Upgrading existing objects

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 3.2.0 contains the following bug fixes and enhancements:

Ticket number	Summary
POST-293	Compressed backup and backup timestamp
POST-470	Pg_vSDK >> Plugin should add a parameter to control debug log ON/OFF in `dlpx_pg_logrotate.conf`
POST-497	Ingestion from backup should be more efficient
POST-699	Removing source sizing for VDB

## PostgreSQL 3.1.0 release notes

### New features

#### Source sizing implementation on PostgreSQL plugin

This feature enables you to check the size of PostgreSQL cluster or database being virtualized from the Delphix Engine. The calculation of the dataset size is based on the ingestion method used. For staging pull methods, if the whole cluster is ingested then the size of the cluster will be calculated or else the size of the ingested single database will be calculated. Source sizing cannot be implemented when staging push method is used.

**⚠** This feature requires the plugin to run SQL queries on the datasets. If the plugin cannot login to the dataset for any reason, then source sizing cannot be implemented. For more details about this feature, see [Source Sizing Implementation for dSource](#) and [Source Sizing Implementation for VDB](#)

If you are using privilege elevation and upgrading to PostgreSQL 3.1.0 version, then you will have to change the sudoers entry. For more details see, [Prerequisites for Privilege Elevation using DLPX\\_DB\\_EXEC Script](#)

**⚠** Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

RHEL 8.6	N	N	N	N	N	Y	Y	Y
SUSE 11	Y	N	N	N	N	N	N	N
SUSE 12	Y	Y	Y	Y	Y	N	N	N
SUSE 15	N	N	N	N	N	N	Y	N
Ubuntu 16.04	N	N	N	Y	N	N	N	N
SUSE 15SP3	N	N	N	N	N	N	Y	N

where **x** represents the minor version.

#### Cloud vendors

- All the available PostgreSQL Database minor versions will be supported for the above-mentioned major versions.
- SUSE 15SP3 is supported on Power 8 hardware.
- Make sure to install libncurses.5 or libncurses.6 in the host, for supporting RHEL and SUSE. You can refer [KBA 5622](#) for actionable steps.

Supported Cloud Vendors	PostgreSQL 11	PostgreSQL 12	PostgreSQL 13
Amazon RDS PostgreSQL	Y	Y	Y
Amazon Aurora PostgreSQL	Y	Y	Y

For this release, only a single DB ingestion feature is supported for the Amazon RDS/Aurora PostgreSQL through the pg\_dump/pg\_restore method.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions from 1.0.1 till 1.3.2 are currently in extended support. Please reach out to Delphix customer support for any queries.

 Currently, PostgreSQL Plugin 1.4.1 is not supported on SUSE 12.x.

Delphix Engine Version	Plugin Version											
	1.4.0	1.4.1	1.4.2	1.4.3	1.4.4	1.5.0	1.5.1	2.0.0	2.1.0	2.1.1	3.0.0	3.1.0
6.0.0.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.2.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.3.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.4.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.5.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.6.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.7.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N

	Plugin Version											
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.11.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.12.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.13.x	Y	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.14.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.15.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.16.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.17.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 3.1.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 3.1.0
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.

Your version	Recommended upgrade path to 3.1.0
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.
1.5.0 1.5.1	Upgrade directly to 2.0.0 and follow the upgrade path below.
2.0.0 2.1.0	Upgrade directly to 3.0.0.
3.0.0	Upgrade directly to the latest version 3.1.0.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0 → 3.1.0

For PostgreSQL customer with plugin version 2.0.0

Plugin upgrade path: 2.0.0/2.1.0 → 3.0.0 → 3.1.0

### Upgrading existing objects

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 3.1.0 contains the following bug fixes and enhancements:

Ticket number	Summary
POST-596	New mechanism of creating files to remove wildcard entry for `echo` in sudoers file.
POST-611	Ubuntu Certification >> Linking is failing when pg_hba.conf and pg_ident.conf files are not at data directory
POST-642	dSource Single DB Ingestion >> User should not be allowed to change database name parameter, unless it's a RESYNC operation
POST-668	Staging Push >> Failure to provision a VDB using privilege elevation from Staging Push snapshot with provisioning allowed

## PostgreSQL 3.0.0 release notes

### New features

#### Staging push

The PostgreSQL Plugin 3.0.0 release introduces a new data ingestion mechanism i.e. Staging Push that enables you to push data into the Delphix-provided mount point on your own. It is an alternative Delphix dSource data ingestion approach that enables you to push the data in Delphix, which is different from the conventional pull model where Delphix pulls the data.

Delphix relinquishes the responsibility to prepare the data (ie: recover to a specific state) on the staging push. It is different from conventional staging where Delphix controls the state of recovery of the staging database.

There are two mechanisms to create dSource on the staging server.

- Pull architecture: The Postgres plugin pulls the data into the Delphix-provided mount location.
- Staging Push architecture: You push the data into the Delphix-provided mount point on your own.

For more details, see [Staging Push Implementation](#)

#### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

#### Migration and compatibility

Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

#### Key:

Color	Supported?
Y	Yes
N	No

#### RHEL/CentOS/SUSE/Ubuntu

Support ed OS Version	9.4.x (Open Source & EDB)	9.5.x (Open Source & EDB)	9.6.x (Open-source & EDB)	10.x (Open-source & EDB)	11.x (Open-source & EDB)	12.x (Open-source & EDB)	13.x (Open-source & EDB)	EnterpriseDB (Open-source & EDB)

6.0.15.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 3.0.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 3.0.0
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.
1.5.0 1.5.1	Upgrade directly to 2.0.0 and follow the upgrade path below.
2.0.0 2.1.0	Upgrade directly to the latest version 3.0.0.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 3.0.0

For PostgreSQL customer with plugin version 2.0.0

Plugin upgrade path: 2.0.0/2.1.0 → 3.0.0

**Upgrading existing objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

#### Fixed issues

PostgreSQL version 3.0.0 contains the following bug fixes and enhancements:

<b>Ticket number</b>	<b>Summary</b>
POST-537	<code>postgresql.auto.conf</code> and <code>recovery.signal</code> config files needs to be handled in VDB creation
POST-546	<code>`logging_collector`</code> should be enabled for the dSource
POST-563	SP >> Snapshot operation is failing if the port value is quoted with the strings in config file
POST-565	PG 2.1.1 >> Variable value is missing in error
POST-566	Time difference issue between Delphix Engine and Staging Environment Host
POST-571	Environment variables between low-privileged user & high-privileged user are not translated

## PostgreSQL 2.1.1 release notes

The PostgreSQL plugin version 2.1.1 release consists of only bug fixes.

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 2.1.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 2.1.1
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.
1.5.0 1.5.1	Upgrade directly to 2.0.0, 2.1.0, or 2.1.1 and follow the upgrade path below.
2.0.0 2.1.0	Upgrade directly to the latest version 2.1.1.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 2.1.1

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 2.1.1

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 2.1.1

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0/2.1.0 → 2.1.1

For PostgreSQL customer with plugin version 2.0.0

Plugin upgrade path: 2.0.0/2.1.0 → 2.1.1

### Upgrading existing objects

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 2.1.1 contains the following bug fixes and enhancements:

Ticket number	Summary
POST-555	Logging of large content is failing at staging/target side
POST-562	Echo command in .bash_profile of the user blocks several Plugin operations

## PostgreSQL 2.1.0 release notes

The PostgreSQL Plugin version 2.1.0 includes the following improvements and features:

### New features

#### Privilege elevation

The Privilege Elevation feature allows you to use a low privileged OS user to create a dSource or VDB. To use this feature, you must provide a username in the **Privileged OS account (optional)** field on the dSource creation page. The plugin will then use the `d\lpx_db_exec` script to perform the privilege elevation. The script has to be updated via the engine API before the creation/discovery of an environment.

#### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

#### Migration and compatibility

Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

#### Key:

Color	Supported?
Y	Yes
N	No

#### RHEL/CentOS/SUSE/Ubuntu

SUSE 15SP3	N	N	N	N	N	N	Y	N

where **x** represents the minor version.

Cloud Vendors

- All the available PostgreSQL Database minor versions will be supported for the above-mentioned major versions.
- SUSE 15SP3 is supported on Power 8 hardware.
- Make sure to install libncurses.5 or libncurses.6 in the host, for supporting RHEL and SUSE. You can refer [KBA 5622](#) for actionable steps.

Supported cloud vendors	PostgreSQL 11	PostgreSQL 12	PostgreSQL 13
Amazon RDS PostgreSQL	Y	Y	Y
Amazon Aurora PostgreSQL	Y	Y	Y

**⚠** For this release, only a single DB ingestion feature is supported for the Amazon RDS/Aurora PostgreSQL through the pg\_dump/pg\_restore method.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

**⚠** The plugin versions from 1.0.1 till 1.3.2 are currently in extended support. Please reach out to Delphix customer support for any queries.

**⚠** Currently, PostgreSQL Plugin 1.4.1 is not supported on SUSE 12.x.

Delphix Engine Version	Plugin Version								
	1.4.0	1.4.1	1.4.2	1.4.3	1.4.4	1.5.0	1.5.1	2.0.0	2.1.0
6.0.0.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.2.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.3.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.4.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.5.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.6.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.7.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.11.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.12.x	Y	Y	Y	Y	Y	Y	Y	N	N

	Plugin Version								
6.0.13.x	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.14.x	Y	Y	Y	Y	Y	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 2.1.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 2.1.0
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.
1.5.0 1.5.1	Upgrade directly to 2.0.0 and follow the upgrade path below.
2.0.0	Upgrade directly to the latest version 2.1.0.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0 → 2.1.0

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0 → 2.1.0

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0 → 2.1.0

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0 → 2.1.0

For PostgreSQL customer with plugin version 2.0.0

Plugin upgrade path: 2.0.0 → 2.1.0

### Upgrading existing objects

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 2.0.0 contains the following bug fixes and enhancements:

Ticket number	Summary
POST-494	Using dlpx_db_exec for privilege elevation
POST-511	`max_connections` parameter on staging should be set according to the source
POST-518	`netstat` utility is not available in SuSE 15

## PostgreSQL 2.0.0 release notes

The PostgreSQL Plugin version 2.0.0 includes the following improvements and features:

- Plugin generated log file will now be placed at <toolkit path>/Delphix\_COMMON\_<long id>/plugin/postgres-vsdk\_12c9a11f-fab6-4792-a5da-49d726c004df/<os user> instead of <toolkit path>/postgres/logs.
- Improved logging
- The plugin logs will be part of the support bundle.
- The plugin logs will be available on the target host as well as on the Delphix Engine host.
- Introduction of a new generic config ini file dlpx\_postgres\_config.ini which will be present at the scratch path. The previous log configure file dlpx\_pg\_logrotate.conf will no longer be available and the contents of this file will be moved to the generic config ini file-dlpx\_postgres\_config.ini.
- The PostgreSQL plugin will now have one more ingestion mechanism - Single Database Ingestion that allows you to virtualize a single database.

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Key:

6.0.13.x	Y	Y	Y	Y	Y	Y	Y	N
6.0.14.x	Y	Y	Y	Y	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 2.0.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 2.0.0
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.

Your version	Recommended upgrade path to 2.0.0
1.5.0 1.5.1	Upgrade directly to the latest version 2.0.0.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2 interested in the external backups feature:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

For PostgreSQL customer with plugin version 2.0.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1 → 2.0.0

### Upgrading existing objects

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 2.0.0 contains the following bug fixes and enhancements:

Ticket number	Summary
<a href="#">POST-300</a>	pg_basebackup failure not captured
<a href="#">POST-303</a>	Default value for PostgreSQL Mount Path is wrong
<a href="#">POST-306</a>	Delphix GUI allows PostgreSQL VDB port to be changed while the VDB is running
<a href="#">POST-422</a>	Snapshots created for dSource despite failure to start staging database
<a href="#">POST-428</a>	Instance failure reason not captured

Ticket number	Summary
<a href="#">POST-431</a>	Unable to provision PostgreSQL VDB with parameters that use the strftime specification formatting
<a href="#">POST-441</a>	Postgres dsource creation with existing backup fails due to missing wal file

## PostgreSQL 1.5.1 release notes

This release includes the Streaming Replication Monitoring feature that monitors the streaming replication by reading the Postgres database logs every minute.

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.

- b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 1.5.1 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 1.5.1
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to 1.5.0 or the latest version 1.5.1.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2 interested in the external backups feature:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0/1.5.1

**Upgrading existing objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

## Fixed issues

PostgreSQL version 1.5.1 contains the following bug fixes and enhancements:

<b>Ticket number</b>	<b>Summary</b>
POST-418	Replication monitoring - Lua plugin

## PostgreSQL 1.5.0 release notes

This release includes some bug fixes and enhancements (listed in this document towards the end).

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

Amazon Aurora PostgreSQL	Y	Y	Y

For this release, only a single DB ingestion feature is supported for the Amazon RDS/Aurora PostgreSQL through the `pg_dump/pg_restore` method.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions from 1.0.1 till 1.3.2 are currently in extended support. Please reach out to Delphix customer support for any queries.

 Currently, PostgreSQL Plugin 1.4.1 is not supported on SUSE 12.x.

	Plugin Version					
Delphix Engine Version	1.4.0	1.4.1	1.4.2	1.4.3	1.4.4	1.5.0
6.0.0.x	Y	Y	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y	Y	Y
6.0.5.x	Y	Y	Y	Y	Y	Y
6.0.6.x	Y	Y	Y	Y	Y	Y
6.0.7.x	Y	Y	Y	Y	Y	Y
6.0.8.x	Y	Y	Y	Y	Y	Y
6.0.9.x	Y	Y	Y	Y	Y	Y
6.0.10.x	Y	Y	Y	Y	Y	Y
6.0.11.x	Y	Y	Y	Y	Y	Y
6.0.12.x	Y	Y	Y	Y	Y	Y

**Unsupported PostgreSQL versions and features**

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 1.5.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x, 10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 1.5.0
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, 1.4.2, 1.4.3, or 1.4.4 and follow the path below.
1.4.1 1.4.2 1.4.3	Upgrade directly to the latest version, 1.5.0.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2 interested in the external backups feature:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4 → 1.5.0

**Upgrading existing objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 1.5.0 contains the following bug fixes and enhancements:

Ticket number	Summary
POST-202	If the port is not present in postgresql.conf on the source, it's not provided in staging and VDBs
POST-283	Security enhancement - Plugin overrides listen_addresses parameter in postgresql.conf to "localhost" on staging & target server
POST-292	dSource configuration parameters don't accept empty values
POST-295	The staging server is created using a copy of the production parameters file
POST-297	Postgres Plugin Should check if the toolkit directory is accessible by the OS user
POST-298	primary_conninfo' parameter is not getting commented out in vdb flow
POST-302	Allow users to set empty values for a parameter in a configuration file
POST-312	delphix_postgres_debug.log is too large to manage
POST-316	Propagation of Hotfix 1112 code changes to plugin 1.5.0 release

## PostgreSQL 1.4.4 release notes

Welcome to the latest release of the Delphix Engine database virtualization system.

### New features

No new features are included in PostgreSQL plugin version 1.4.4. This release includes a bug fix (listed in this document towards the end).

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Key:

Color	Supported?
Y	Yes
N	No

### RHEL/CentOS/SUSE/Ubuntu

Supported OS Version	9.4.x (Open Source & EDB)	9.5.x (Open Source & EDB)	9.6.x (Open-source & EDB)	10.x (Open-source & EDB)	11.x (Open-source & EDB)	12.x (Open-source & EDB)	13.x (Open-source & EDB)	EnterpriseDB (Open-source & EDB)
<b>Supported DBMS Version</b>								
RHEL/CentOS 7.3	Y	Y	Y	Y	Y	Y	N	N
RHEL/CentOS 7.4	Y	Y	Y	Y	Y	Y	N	N
RHEL/CentOS 7.5	Y	Y	Y	Y	Y	Y	N	N

RHEL/CentOS 7.6	Y	Y	Y	Y	Y	Y	N	N
RHEL/CentOS 7.7	Y	Y	Y	Y	Y	Y	N	N
RHEL/CentOS 7.8	N	N	Y	N	N	Y	N	N
RHEL/CentOS 7.9	N	N	Y	Y	N	Y	Y	Y
RHEL/CentOS 8.3	N	N	N	N	N	Y	Y	Y
SUSE 11	Y	N	N	N	N	N	N	N
SUSE 12	Y	Y	Y	Y	Y	N	N	N
SUSE 15	N	N	N	N	N	N	Y	N
Ubuntu 16.04	N	N	N	Y	N	N	N	N
SUSE 15SP3	N	N	N	N	N	N	Y	N

where **x** represents the minor version.

 • All the available PostgreSQL Database minor versions will be supported for the above-mentioned major versions.

• SUSE 15SP3 is supported on Power 8 hardware.

• Make sure to install libncurses.5 or libncurses.6 in the host, for supporting RHEL 8.x and SUSE15. You can refer [KBA 5622](#) for actionable steps.

Cloud vendors

Supported cloud vendors	PostgreSQL 11	PostgreSQL 12	PostgreSQL 13
Amazon RDS PostgreSQL	Y	Y	Y
Amazon Aurora PostgreSQL	Y	Y	Y

 For this release, only a single DB ingestion feature is supported for the Amazon RDS/Aurora PostgreSQL through the pg\_dump/pg\_restore method.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions from 1.0.1 till 1.3.2 are currently in extended support. Please reach out to Delphix customer support for any queries.

 Currently, PostgreSQL Plugin 1.4.1 is not supported on SUSE 12.x.

	Plugin Version				
Delphix Engine Version	1.4.0	1.4.1	1.4.2	1.4.3	1.4.4
6.0.0.x	Y	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y	Y
6.0.5.x	Y	Y	Y	Y	Y
6.0.6.x	Y	Y	Y	Y	Y
6.0.7.x	Y	Y	Y	Y	Y
6.0.8.x	Y	Y	Y	Y	Y
6.0.9.x	Y	Y	Y	Y	Y
6.0.10.x	Y	Y	Y	Y	Y
6.0.11.x	Y	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.

- b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 1.4.4 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 1.4.4
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1 or 1.4.2, 1.4.3, or 1.4.4 the latest plugin for PostgreSQL.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2 interested in the external backups feature:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3/1.4.4

**Upgrading existing objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolved on the status tab of dSource.

Fixed issues

PostgreSQL version 1.4.4 contains the following bug fix:

Key	Summary
POST-291	Error Handling for Authentication Failure in <code>pg_basebackup</code> command

## PostgreSQL 1.4.3 release notes

Welcome to the latest release of the Delphix Engine database virtualization system.

### New features

No new features are included in PostgreSQL plugin version 1.4.3. This release includes a bug fix (listed in this document towards the end).

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Key:

Color	Supported?
Y	Yes
N	No

### RHEL/CentOS/SUSE/Ubuntu

Supported OS Version	9.4.x (Open Source & EDB)	9.5.x (Open Source & EDB)	9.6.x (Open-source & EDB)	10.x (Open-source & EDB)	11.x (Open-source & EDB)	12.x (Open-source & EDB)	13.x (Open-source & EDB)	EnterpriseDB (Open-source & EDB)
<b>Supported DBMS Version</b>								
RHEL/CentOS 7.3	Y	Y	Y	Y	Y	Y	N	N
RHEL/CentOS 7.4	Y	Y	Y	Y	Y	Y	N	N

Ubuntu 16.04	N	N	N	Y	N	N	N	N
SUSE 15SP3	N	N	N	N	N	N	Y	N

where **x** represents the minor version.

 • All the available PostgreSQL Database minor versions will be supported for the above-mentioned major versions.

• SUSE 15SP3 is supported on Power 8 hardware.

• Make sure to install libncurses.5 or libncurses.6 in the host, for supporting RHEL 8.x and SUSE15. You can refer [KBA 5622](#) for actionable steps.

Cloud vendors

Supported cloud vendors	PostgreSQL 11	PostgreSQL 12	PostgreSQL 13
Amazon RDS PostgreSQL	Y	Y	Y
Amazon Aurora PostgreSQL	Y	Y	Y

 For this release, only a single DB ingestion feature is supported for the Amazon RDS/Aurora PostgreSQL through the pg\_dump/pg\_restore method.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

 The plugin versions from 1.0.1 till 1.3.2 are currently in extended support. Please reach out to Delphix customer support for any queries.

 Currently, PostgreSQL Plugin 1.4.1 is not supported on SUSE 12.x.

Delphix Engine Version	Plugin Version			
	1.4.0	1.4.1	1.4.2	1.4.3
6.0.0.x	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y
6.0.5.x	Y	Y	Y	Y
6.0.6.x	Y	Y	Y	Y
6.0.7.x	Y	Y	Y	Y
6.0.8.x	Y	Y	Y	Y
6.0.9.x	Y	Y	Y	Y
6.0.10.x	Y	Y	Y	Y

Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e (9.2, 9.3) are NOT supported by the plugin.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - a. Unlogged Tables: All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - b. Point In Time recovery: Currently, the Plugin doesn't support Point in Time recovery of the PostgreSQL database.

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 1.4.3 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, 12.x, and 13.x customers

**Path B - Existing PostgreSQL customers with different plugin versions:**

Your version	Recommended upgrade path to 1.4.3
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1 or 1.4.2 or 1.4.3 the latest plugin for PostgreSQL.

For PostgreSQL customers with plugin version 1.0.1 or 1.0.2 interested in the external backups feature:

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3

For PostgreSQL customers with plugin version 1.1.0

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3

For PostgreSQL customer with plugin version 1.2.0

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2/1.4.3

**Upgrading existing objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolve on the status tab of dSource.

Fixed issues

PostgreSQL version 1.4.3 contains the following bug fix:

Key	Summary
POST-284	The plugin doesn't check if the staging Postgres database is in a stable state or not

## PostgreSQL 1.4.2 release notes

Welcome to the latest release of the Delphix Engine database virtualization system.

### New features

No new features included in PostgreSQL plugin version 1.4.2. This release consists of only bug fixes (listed in this document towards the end).

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#).

### Migration and compatibility

#### Supported versions

PostgreSQL Standard Versions:

- PostgreSQL 9.4.x
- PostgreSQL 9.5.x
- PostgreSQL 9.6.x
- PostgreSQL 10.x
- PostgreSQL 11.x
- PostgreSQL 12.x

PostgreSQL EDB Versions:

- PostgreSQL 9.4.x
- PostgreSQL 9.5.x
- PostgreSQL 9.6.x
- PostgreSQL 10.x
- PostgreSQL 11.x
- PostgreSQL 12.x

### Supported operating systems

#### RHEL/CentOS/SLES - PostgreSQL open source & EDB

	Supported DBMS Version					
Supported OS Version	PostgreSQL 9.4.x (Open Source & EDB)	PostgreSQL 9.5.x (Open Source & EDB)	PostgreSQL 9.6.x (Open Source & EDB)	PostgreSQL 10.x (Open Source & EDB)	PostgreSQL 11.x (Open Source & EDB)	PostgreSQL 12.x (Open Source & EDB)
RHEL/CentOS 7.3	Y	Y	Y	Y	Y	Y

	Supported DBMS Version					
RHEL/ CentOS 7.4	Y	Y	Y	Y	Y	Y
RHEL/ CentOS 7.5	Y	Y	Y	Y	Y	Y
RHEL/ CentOS 7.6	Y	Y	Y	Y	Y	Y
RHEL/ CentOS 7.8	N	N	N	N	N	Y
SLES 11	Y	N	N	N	N	N
SLES 12	Y	Y	Y	Y	Y	N

where x is the minor version of the PostgreSQL Database.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

Delphi x Engine	Postgr eSQL 1.0.1	Postgr eSQL 1.0.2	Postgr eSQL 1.1.0	Postgr eSQL 1.2.0	Postgr eSQL 1.3.0	Postgr eSQL 1.3.1	Postgr eSQL 1.3.2	Postgr eSQL 1.4.0	Postgr eSQL 1.4.1	Postgr eSQL 1.4.2
6.0.0.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.1.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.2.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.3.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.4.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.5.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.6.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.7.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y

Delphi x Engine	PostgreSQL 1.0.1	PostgreSQL 1.0.2	PostgreSQL 1.1.0	PostgreSQL 1.2.0	PostgreSQL 1.3.0	PostgreSQL 1.3.1	PostgreSQL 1.3.2	PostgreSQL 1.4.0	PostgreSQL 1.4.1	PostgreSQL 1.4.2
6.0.8.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y
6.0.9.x	N	N	Y	Y	Y	Y	Y	Y	Y	Y

Plugin upgrade path

**Path A - New plugin installation for PostgreSQL customers:**

- Upload 1.4.2 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, and 12.x customers

**Path B - Existing PostgreSQL customers with different Plugin version:**

Your Version	Recommended Upgrade Path to 1.4.2
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1 or 1.4.2 the latest plugin for PostgreSQL.

**For PostgreSQL customers with plugin version 1.0.1 or 1.0.2 interested in the External Backups feature:**

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2

**For PostgreSQL customers with Plugin version 1.1.0**

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1/1.4.2

**For PostgreSQL customer with Plugin version 1.2.0**

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1/1.4.2

**Upgrading existing objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using the "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolve on the status tab of dSource.

### Unsupported PostgreSQL versions and features

- PostgreSQL versions below 9.4 i.e 9.2, 9.3 (including the minor versions) are not supported.
- It is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - **Unlogged tables:** All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - **Point In time recovery:** Currently, the plugin doesn't support Point in Time recovery of the PostgreSQL database.

### Fixed issues

PostgreSQL version 1.4.2 contains the following bug fixes:

Key	Summary
POST-274	`data_directory` parameter in the postgresql.conf file is causing failure in dSource and VDB flow
POST-275	Linking Fails if the parameter which needs to be configured is commented through multiple `#`
POST-276	Linking Fails if the mandatory parameter required to setup replication is commented in config file

## PostgreSQL 1.4.1 release notes

Welcome to the latest release of the Delphix Engine database virtualization system.

### New features

No new features are included in PostgreSQL Plugin version 1.4.1. This release consists of only bug fixes (listed in this document towards the end).

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#).

### Migration and compatibility

#### Supported versions

PostgreSQL Standard versions:

- PostgreSQL 9.4.x
- PostgreSQL 9.5.x
- PostgreSQL 9.6.x
- PostgreSQL 10.x
- PostgreSQL 11.x
- PostgreSQL 12.x

PostgreSQL EDB versions:

- PostgreSQL 9.4.x
- PostgreSQL 9.5.x
- PostgreSQL 9.6.x
- PostgreSQL 10.x
- PostgreSQL 11.x
- PostgreSQL 12.x

### Supported operating Systems

#### RHEL/centoS/SLES - PostgreSQL open Source & EDB

Supported DBMS version	PostgreSQL 9.4.x (open Source & EDB)	PostgreSQL 9.5.x (open Source & EDB)	PostgreSQL 9.6.x (open Source & EDB)	PostgreSQL 10.x (open Source & EDB)	PostgreSQL 11.x (open Source & EDB)	PostgreSQL 12.x (open Source & EDB)
Supported oS version						
RHEL/centoS 7.3	Y	Y	Y	Y	Y	Y

RHEL/ centoS 7.4	Y	Y	Y	Y	Y	Y
RHEL/ centoS 7.5	Y	Y	Y	Y	Y	Y
RHEL/ centoS 7.6	Y	Y	Y	Y	Y	Y
SLES 11	Y	N	N	N	N	N
SLES 12	Y	Y	Y	Y	Y	N

where **x** is the minor version of the PostgreSQL Database.

Plugin/Delphix Engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

Delphix Engine	Postgre SQL 1.0.1	Postgre SQL 1.0.2	Postgre SQL 1.1.0	Postgre SQL 1.2.0	Postgre SQL 1.3.0	Postgre SQL 1.3.1	Postgre SQL 1.3.2	Postgre SQL 1.4.0	Postgre SQL 1.4.1
6.0.0.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.1.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.2.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.3.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.4.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.5.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.6.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.7.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.8.x	N	N	Y	Y	Y	Y	Y	Y	Y
6.0.9.x	N	N	Y	Y	Y	Y	Y	Y	Y

Plugin upgrade path

**Path A - new plugin installation for postgresSQL customers:**

- Upload 1.4.1 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x, and 12.x customers

**Path B - existing postgresSQL customers with different plugin version:**

<i>Your version</i>	<i>Recommended Upgrade Path to 1.4.1</i>
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.1, the latest plugin for PostgreSQL.

**for PostgreSQL customers with Plugin version 1.0.1 or 1.0.2 interested in External Backups feature:**

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1

**for PostgreSQL customers with Plugin version 1.1.0**

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.1

**for PostgreSQL customers with Plugin version 1.2.0**

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.1

**Upgrading Existing objects**

in order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using "custom configuration" option on the Ui :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. it is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolve on the status tab of dSource.

**Unsupported postgresSQL versions and features**

- PostgreSQL versions below 9.4 i.e 9.2, 9.3 (including the minor versions) are not supported.
- it is not possible to access the staging server with PostgreSQL 9.4 and PostgreSQL 9.5 versions.
- Broadly there are two features that are not supported by the plugin:
  - **Unlogged Tables:** All the tables which are not logged (unlogged) will not be supported by the Plugin.
  - **Point in Time recovery:** currently, the Plugin doesn't support Point in Time recovery of PostgreSQL database

fixed issues

PostgreSQL version 1.4.1 contains the following bug fixes:

<b>Key</b>	<b>Summary</b>
PoST-269	Postgres DB_SYNC fails - ESCL-3179
PoST-270	Plugin should handle postgresql.auto.conf entries during dsource creation

## PostgreSQL 1.4.0 release notes

Welcome to the latest release of the Delphix Engine database virtualization system.

### New features

PostgreSQL Plugin version 1.4.0 contains the following certifications :

Operating System - RHEL/CentOS 7.8 version Support with PostgreSQL 12.x.

### Plugin installation

Plugins to support PostgreSQL virtualization are not automatically included in the virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A Support case can be opened requesting installation by following this [link](#).

### Migration and compatibility

#### Supported versions

PostgreSQL Standard versions:

- PostgreSQL 9.4.x
- PostgreSQL 9.5.x
- PostgreSQL 9.6.x
- PostgreSQL 10.x
- PostgreSQL 11.x
- PostgreSQL 12.x

PostgreSQL EDB versions:

- PostgreSQL 9.4.x
- PostgreSQL 9.5.x
- PostgreSQL 9.6.x
- PostgreSQL 10.x
- PostgreSQL 11.x
- PostgreSQL 12.x

### Supported operating systems

#### RHEL/CentOS/SLES - PostgreSQL open source & EDB

Supported DBMS version	PostgreSQL 9.4.x (Open Source & EDB)	PostgreSQL 9.5.x (Open Source & EDB)	PostgreSQL 9.6.x (Open Source & EDB)	PostgreSQL 10.x (Open Source & EDB)	PostgreSQL 11.x (Open Source & EDB)	PostgreSQL 12.x (Open Source & EDB)
Supported OS version						
RHEL/CentOS 7.3	N	Y	Y	Y	Y	Y

RHEL/CentOS 7.4	Y	Y	Y	Y	Y	Y
RHEL/CentOS 7.5	Y	Y	Y	Y	Y	Y
RHEL/CentOS 7.6	Y	Y	Y	Y	Y	Y
SLES 11	Y	N	N	N	N	N
SLES 12	Y	Y	Y	Y	Y	N

where **x** is the minor version of the PostgreSQL Database.

Plugin/Delphix engine compatibility

Plugins should be installed on compatible Delphix Engines per the table below:

Delphix Engine	PostgreSQL 1.0.1	PostgreSQL 1.0.2	PostgreSQL 1.1.0	PostgreSQL 1.2.0	PostgreSQL 1.3.0	PostgreSQL 1.3.1	PostgreSQL 1.3.2	PostgreSQL 1.4.0
6.0.0.x	N	N	Y	Y	Y	Y	Y	Y
6.0.1.x	N	N	Y	Y	Y	Y	Y	Y
6.0.2.x	N	N	Y	Y	Y	Y	Y	Y
6.0.3.x	N	N	Y	Y	Y	Y	Y	Y
6.0.4.x	N	N	Y	Y	Y	Y	Y	Y
6.0.5.x	N	N	Y	Y	Y	Y	Y	Y
6.0.6.x	N	N	Y	Y	Y	Y	Y	Y
6.0.7.x	N	N	Y	Y	Y	Y	Y	Y
6.0.8.x	N	N	Y	Y	Y	Y	Y	Y
6.0.9.x	N	N	Y	Y	Y	Y	Y	Y

Plugin upgrade path

**Path A - New plugin installation for postgresQL customers:**

- Upload 1.4.0 Plugin for PostgreSQL 9.4.x, 9.5.x, 9.6.x,10.x, 11.x and 12.x customers

**Path B - Existing PostgreSQL customers with different plugin version:**

<i>Your version</i>	<i>Recommended Upgrade Path to 1.4.0</i>
1.0.1 1.0.2	Upgrade to 1.1.0 and follow the upgrade path below.
1.1.0	Upgrade to 1.2.0 and follow the upgrade path below.
1.2.0	Upgrade to 1.3.0 and follow the upgrade path below.
1.3.0	Upgrade to 1.4.0, the latest plugin for PostgreSQL.

**For PostgreSQL customers with Plugin version 1.0.1 or 1.0.2 interested in External Backups feature:**

Plugin upgrade path: 1.0.1 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0

Plugin upgrade path 1.0.2 → 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0

**For PostgreSQL customers with Plugin version 1.1.0**

Plugin upgrade path: 1.1.0 → 1.2.0 → 1.3.0 → 1.4.0

**For PostgreSQL customer with Plugin version 1.2.0**

Plugin upgrade path: 1.2.0 → 1.3.0 → 1.4.0

**Upgrading Existing Objects**

In order to upgrade the existing objects with 1.1.0 (i.e 1.0.1 → 1.1.0 or 1.0.2 → 1.1.0), just after the upgrade, it is mandatory to update below two parameters of dSource using "custom Configuration" option on the UI :

- Source IP Address
- Source Port

A critical fault will show up on dSource just after the upgrade. It is because the engine is not able to find the source config from which dSource was created. As we have moved to manual discovery in this release, we need to mark this fault as resolve on the status tab of dSource.

Unsupported postgresQL versions and features

PostgreSQL versions below 9.4 i.e 9.2, 9.3 (including the minor versions) are not supported.

**Unlogged Tables:** All the tables which are not logged (unlogged) will not be supported by the Plugin.

**Point In Time recovery:** Currently, the Plugin doesn't support Point in Time recovery of PostgreSQL database

## SAP HANA release notes

This section covers the following topics:

- [SAP HANA 2.0 plugin version 6.3.1 release notes](#)
- [SAP HANA 2.0 plugin version 6.3.0 release notes](#)
- [SAP HANA 2.0 plugin version 6.2.1 release notes](#)
- [SAP HANA 2.0 plugin version 6.2.0 release notes](#)
- [SAP HANA 2.0 plugin version 6.1.1 release notes](#)
- [SAP HANA 2.0 plugin version 6.1.0 release notes](#)
- [SAP HANA 2.0 plugin version 6.0.1 release notes](#)
- [SAP HANA 2.0 plugin version 6.0.0 release notes](#)
- [SAP HANA 2.0 plugin version 4.3.2 release notes](#)
- [SAP HANA 2.0 plugin version 4.3.1 release notes](#)
- [SAP HANA 2.0 plugin version 4.3.0 release notes](#)
- [SAP HANA 2.0 plugin version 4.2.0 release notes](#)

- [SAP HANA 2.0 plugin version 4.1.1 release notes](#)

## SAP HANA 2.0 plugin version 6.3.1 release notes

### What's new

The SAP HANA 2.0 plugin 6.3.1 release consists of a single bug fix. For more information, see [Fixed Issues](#)

### Plugin installation

Plugins to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#).

### Migration and compatibility

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Supported DBMS version

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

A target may have a higher SPS release than a source; the reverse is not supported.

### Key:

Color	Supported?
Y	Yes
N	No

### Supported operating system

	Supported DBMS version	
Supported OS version	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)

	Supported DBMS version	
RHEL 7.9	Y	Y
RHEL 8.1	Y	Y
RHEL 7.3/7.4/7.5	Y	N
RHEL 7.6	Y	Y
SUSE 12 SP 03	Y	N
SUSE 15 SP 02	N	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	Lua-based plugin						vSDK-based Plugin							
	4.1.1	4.1.2	4.2.0	4.3.0	4.3.1	4.3.2	6.0.0	6.0.1	6.1.0	6.1.1	6.2.0	6.2.1	6.3.0	6.3.1
6.0.0.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.3.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.4.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.5.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.6.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.7.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N	N
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N	N

	Lua-based plugin						vSDK-based Plugin							
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N	N
6.0.11.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N	N
6.0.12.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.13.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.14.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.15.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.16.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
6.0.17.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
7.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
8.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
9.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
10.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

To upgrade from the existing SAP HANA Staged (VSDK-based) plugin follow the recommended path below.

<b>Your version</b>	<b>Recommended upgrade path to 6.3.1</b>
6.0.0 6.0.1	Upgrade to 6.1.0 and follow the path below
6.1.0 6.1.1	Upgrade to 6.2.0 and follow the path below
6.2.0 6.2.1	Upgrade directly to 6.3.1
6.3.0	Upgrade directly to 6.3.1

#### Fixed issues

The following issues are fixed in this release:

<b>Delphix ticket number</b>	<b>Summary</b>
CTCHANA-1914	Refining the plugin discovery logic to search for HANA instances.

#### Known issues

The following issues are known to exist in this release:

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/ files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

## SAP HANA 2.0 plugin version 6.3.0 release notes

### What's new

#### Source sizing implementation on HANA plugin

The SAP HANA 2.0 Plugin version 6.3.0 introduces the source sizing feature, that aligns the data source experience with Delphix database standards which will improve your ingestion reporting experience on the per TB pricing model. This feature enables you to calculate the dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset. Source sizing is not implemented for VDB.

This 6.3.0 plugin version also contains fixes for a few bugs, see the [Fixed Issues](#) for more information.

#### Plugin installation

Plugins to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#).

#### Migration and compatibility

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

#### Supported DBMS versions

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

A target may have a higher SPS release than a source; the reverse is not supported.

#### Key:

Color	Supported?
Y	Yes
N	No

Supported operating system

Supported OS version	Supported DBMS version	
	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
RHEL 7.9	Y	Y
RHEL 8.1	Y	Y
RHEL 7.3/7.4/7.5	Y	N
RHEL 7.6	Y	Y
SUSE 12 SP 03	Y	N
SUSE 15 SP 02	N	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	Lua-based plugin						vSDK-based Plugin						
	4.1.1	4.1.2	4.2.0	4.3.0	4.3.1	4.3.2	6.0.0	6.0.1	6.1.0	6.1.1	6.2.0	6.2.1	6.3.0
6.0.0.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.3.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.4.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.5.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.6.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N

	Lua-based plugin						vSDK-based Plugin						
6.0.7.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N
6.0.11.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N	N
6.0.12.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.13.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.14.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.15.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.16.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.17.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
7.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
8.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

### Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

To upgrade from the existing SAP HANA Staged (VSDK-based) plugin follow the recommended path below.

Your version	Recommended upgrade path to 6.3.0
6.0.0 6.0.1	Upgrade to 6.1.0 and follow the path below
6.1.0 6.1.1	Upgrade to 6.2.0 and follow the path below
6.2.0 6.2.1	Upgrade directly to 6.3.0.

### Fixed issues

The following issues are fixed in this release:

Delphix ticket number	summary
CTCHANA-1906	Changing the plugin's environment discovery logic to refer "HDB --version" instead of "landscapeDescription.xml"
CTCHANA-1900	Removal of tenant parameters from UI and plugin
CTCHANA-1891	Incorrect execution time for VDB

### Known issues

The following issues are known to exist in this release:

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

## SAP HANA 2.0 plugin version 6.2.1 release notes

### New features

The SAP HANA 2.0 Plugin version 6.2.1 validates the SAP HANA’s Staging Push solution with third party backup vendors.

### Plugin installation

Plugins to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Supported DBMS versions

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

A target may have a higher SPS release than a source; the reverse is not supported.

6.0.13.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

To upgrade from the existing SAP HANA Staged (VSDK-based) plugin follow the recommended path below.

Your version	Recommended upgrade path to 6.2.1
6.0.0 6.0.1	Upgrade to 6.1.0 and follow the path below
6.1.0 6.1.1	Upgrade directly to 6.2.0, 6.2.1

## Known issues

The following issues are known to exist in this release:

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

## SAP HANA 2.0 plugin version 6.2.0 release notes

### New features

The SAP HANA 2.0 Plugin version 6.2.0 introduces the **Staging Push** feature. This feature provides a new data ingestion mechanism that helps users to push data into the Delphix provided mount point on their own.

### Plugin installation

Plugins to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Supported DBMS versions

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

A target may have a higher SPS release than a source; the reverse is not supported.

### Key:

Color	Supported?
Y	Yes
N	No

### Supported operating system

	Supported DBMS version	
Supported OS version	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)

	Supported DBMS version	
RHEL 7.9	Y	Y
RHEL 8.1	Y	Y
RHEL 7.3/7.4/7.5	Y	N
RHEL 7.6	Y	Y
SUSE 12 SP 03	Y	N
SUSE 15 SP 02	N	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	Lua-based plugin						vSDK-based Plugin				
	4.1.1	4.1.2	4.2.0	4.3.0	4.3.1	4.3.2	6.0.0	6.0.1	6.1.0	6.1.1	6.2.0
6.0.0.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.1.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.3.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.4.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.5.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.6.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.7.x	Y	Y	Y	Y	Y	Y	N	N	N	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N

	Lua-based plugin						vSDK-based Plugin				
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.11.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
6.0.12.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

### Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

### Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

To upgrade from the existing SAP HANA Staged (VSDK-based) plugin follow the recommended path below.

Your version	Recommended upgrade path to 6.2.0
6.0.0 6.0.1	Upgrade to 6.1.0 and follow the path below
6.1.0 6.1.1	Upgrade directly to 6.2.0

### Known issues

The following issues are known to exist in this release:

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

## SAP HANA 2.0 plugin version 6.1.1 release notes

This patch release contains an enhancement that allows the `create_backup_metadata.sh` script to be executed in a non-interactive mode as well.

### Plugin installation

Plugins to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

### Supported DBMS versions

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

A target may have a higher SPS release than a source; the reverse is not supported.

### Key:

Color	Supported?
Y	Yes
N	No

### Supported operating system

Supported OS version	Supported DBMS version	
	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)

	Supported DBMS version	
RHEL 7.9	Y	Y
RHEL 8.1	Y	Y
RHEL 7.3/7.4/7.5	Y	N
RHEL 7.6	Y	Y
SUSE 12 SP 03	Y	N
SUSE 15 SP 02	N	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	Lua-based plugin						vSDK-based Plugin			
	4.1.1	4.1.2	4.2.0	4.3.0	4.3.1	4.3.2	6.0.0	6.0.1	6.1.0	6.1.1

6.0.7.x	Y	Y	Y	Y	Y	Y	N	N	N	N
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

	Lua-based plugin						vSDK-based Plugin			
6.0.10.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

To upgrade from the existing SAP HANA Staged (VSDK-based) plugin follow the recommended path below.

Your version	Recommended upgrade path to 6.1.1
6.0.0 6.0.1	Upgrade to 6.1.0 and follow the path below
6.1.0	Upgrade directly to 6.1.0 or 6.1.1

Known issues

The following issues are known to exist in this release:

Delphix ticket number	Summary	Workaround/Comments
DLPX-75383	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
DLPX-75385	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
DLPX-67911	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
CTCHANA-1599	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
CTCHANA-1598	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/files on the VM
CTCHANA-1586	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
CTCHANA-1565	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
CTCHANA-1514	dSource tenant database can be accessed and written onto	None
CTCHANA-1610	'test_force_disable_enable_vdb' fails across multiple images	None

#### Fixed issues

The following issues are fixed in this release:

<b>Delphix ticket number</b>	<b>Summary</b>
CTCHANA-1661	v6.0.0.0 create_backup_metadata.sh needs ability to run non-interactively
CTCHANA-1667	HANA Recovery failure on staging host yields difficult to decipher error

## SAP HANA 2.0 plugin version 6.1.0 release notes

### Features

#### SAP HANA port control

With this release, a solution has been introduced that keeps the port numbers consistent throughout the VDB life cycle so that the connections made to the VDBs are not disrupted during their life cycle.

#### Plugin installation

Plugins to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

#### Migration and compatibility

This section describes the SAP HANA (DBMS) versions that are supported by the SAP HANA 2.0 Plugin, as well as the compatible operating systems (OS), for use on the source and target environments.

 Delphix Support Policies specifically list Major and Minor release coverage. If a minor release is listed as covered, then all patch releases under that minor release are certified.

#### Supported DBMS versions

SAP HANA version (Standard and enterprise editions)	Support package stack (SPS)
2.0	04
2.0	05

A target may have a higher SPS release than a source; the reverse is not supported.

#### Key:

Color	Supported?
Y	Yes
N	No

Supported operating system

	Supported DBMS version	
Supported OS version	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
RHEL 7.9	Y	Y
RHEL 8.1	Y	Y
RHEL 7.3/7.4/7.5	Y	N
RHEL 7.6	Y	Y
SUSE 12 SP 03	Y	N
SUSE 15 SP 02	N	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	Lua-based plugin						vSDK-based Plugin		
	4.1.1	4.1.2	4.2.0	4.3.0	4.3.1	4.3.2	6.0.0	6.0.1	6.1.0
6.0.0.x	Y	Y	Y	Y	Y	Y	N	N	N

#### Fixed issues

The following issue is fixed in this release:

Delphix ticket number	Summary
<a href="#">CTCHANA-821</a>	HANA SQL Port value should remain consistent for the life of VDB.

## SAP HANA 2.0 plugin version 6.0.1 release notes

This is a bug-fix release of the SAP HANA plugin version 6.0.1.

### Plugin installation

Plugin to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

#### Supported DBMS versions

- SAP HANA Standard and Enterprise Edition 2.0 SPS04
- SAP HANA Standard and Enterprise Edition 2.0 SPS05

#### Supported operating systems

- Red Hat Enterprise Linux (RHEL)
- SUSE Linux

#### Red Hat Enterprise Linux (RHEL)

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 05 (Standard and enterprise editions)</b>
<b>Supported OS version</b>		
RHEL 7.3	Y	N
RHEL 7.4	Y	N
RHEL 7.5	Y	N
RHEL 7.6	Y	Y
RHEL 8.1	Y	Y

#### SUSE Linux

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise Editions)</b>	<b>SAP HANA 2.0 SPS 05 (Standard and enterprise Editions)</b>
<b>Supported OS version</b>		
SUSE 12 SP3	Y	N
SUSE 15 SP2	N	Y

### Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix engine	SAP HANA 6.0.0	SAP HANA 6.0.1
6.0.0.x	N	N
6.0.1.x	N	N
6.0.2.x	N	N
6.0.3.x	N	N
6.0.4.x	N	N
6.0.5.x	N	N
6.0.6.x	N	N
6.0.7.x	N	N
6.0.8.x	Y	Y
6.0.9.x	Y	Y

### Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

### Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

**Known issues**

The following issues are known to exist in this release:

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
<a href="#">DLPX-75383</a>	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
<a href="#">DLPX-75385</a>	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
<a href="#">DLPX-67911</a>	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
<a href="#">CTCHANA-1599</a>	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
<a href="#">CTCHANA-1598</a>	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/ files on the VM
<a href="#">CTCHANA-1586</a>	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
<a href="#">CTCHANA-1565</a>	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
<a href="#">CTCHANA-1514</a>	Dsource tenant database can be accessed and written onto	None
<a href="#">CTCHANA-821</a>	HANA SQL Port value should remain consistent for the life of VDB.	None
<a href="#">CTCHANA-1610</a>	'test_force_disable_enable_vdb' fails across multiple images	None

## SAP HANA 2.0 plugin version 6.0.0 release notes

This is the release of the SAP HANA plugin version 6.0.0.

### New features

This is a conversion from SAP HANA direct plugin to vSDK-based, staged plugin. This plugin will support only customer-provided/External backups ingestion mechanism.

### Plugin installation

Plugin to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

#### Supported DBMS versions

- SAP HANA Standard and Enterprise Edition 2.0 SPS04
- SAP HANA Standard and Enterprise Edition 2.0 SPS05

#### Supported operating systems

- Red Hat Enterprise Linux (RHEL)
- SUSE Linux

#### Red Hat Enterprise Linux (RHEL)

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 05 (Standard and enterprise editions)</b>
<b>Supported OS version</b>		
RHEL 7.3	Y	N
RHEL 7.4	Y	N
RHEL 7.5	Y	N
RHEL 7.6	Y	Y
RHEL 8.1	Y	Y

#### SUSE Linux

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 05 (Standard and enterprise editions)</b>
<b>Supported OS version</b>		

SUSE 12 SP3	Y	N
SUSE 15 SP2	N	Y

#### Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix engine	SAP HANA 6.0.0
6.0.0.x	N
6.0.1.x	N
6.0.2.x	N
6.0.3.x	N
6.0.4.x	N
6.0.5.x	N
6.0.6.x	N
6.0.7.x	N
6.0.8.x	Y
6.0.9.x	Y

#### Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

## Plugin upgrade path

Upgrade from SAP HANA Direct (Lua-based) plugin to SAP HANA Staged (VSDK-based) plugin is not supported.

## Known issues

The following issues are known to exist in this release:

Delphix ticket number	Summary	Workaround/Comments
<a href="#">DLPX-75383</a>	Refresh/Disable not working after failed delete operation	Force delete the VDB. Manually remove the mount point
<a href="#">DLPX-75385</a>	Undo Refresh operation after a failed Refresh job leads to 502 Bad gateway and management stack restart	None
<a href="#">DLPX-67911</a>	Failed enable operation leaving a mount point and next delete operation creating a stale file handle	Manually remove the mount point
<a href="#">CTCHANA-1599</a>	Mount Point change not detected by the plugin may lead to multiple mounts	Mount point not in use can be removed manually
<a href="#">CTCHANA-1598</a>	Plugin loses control in case of user cancel operation.	Manual cleanup can be done in case the plugin leaves any tenant database/ files on the VM
<a href="#">CTCHANA-1586</a>	Refresh after a Force disable on a VDB fails with 'mount not empty' error	Manually remove the mount before proceeding with the Refresh
<a href="#">CTCHANA-1565</a>	Stop/Start operation on a VDB post failed post_refresh hook fails with inappropriate error	None
<a href="#">CTCHANA-1514</a>	Dsource tenant database can be accessed and written onto	None
<a href="#">CTCHANA-821</a>	HANA SQL Port value should remain consistent for the life of VDB.	None

## SAP HANA 2.0 plugin version 4.3.2 release notes

This is a patch release of the SAP HANA plugin version 4.3.2.

### New features

No new features.

### Plugin installation

Plugin to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

#### Supported DBMS versions

- SAP HANA Standard and Enterprise Edition 2.0 SPS04
- SAP HANA Standard and Enterprise Edition 2.0 SPS05

#### Supported operating systems

- Red Hat Enterprise Linux (RHEL)
- S.u.S.E Linux

#### Red Hat Enterprise Linux (RHEL)

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 05 (Standard and enterprise editions)</b>
<b>Supported OS version</b>		
RHEL 7.3	Y	N
RHEL 7.4	Y	N
RHEL 7.5	Y	N
RHEL 7.6	Y	Y
RHEL 8.1	N	Y

SUSE Linux

Supported DBMS version	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
Supported OS version		
SUSE 12 SP3	Y	N
SUSE 15 SP2	N	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	HANA 3.4.5	HANA 3.5.0	HANA 3.5.1	HANA 4.0.0	HANA 4.1.0	HANA 4.1.1	HANA 4.1.2	HANA 4.2.0	HANA 4.3.0	HANA 4.3.1	HANA 4.3.2
6.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.5.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.6.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.7.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.9.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.

- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

#### Plugin upgrade path

Your version	Recommended upgrade path to 4.3.2
3.4.5	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
3.5.0	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
3.5.1	Upgrade to version 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
4.0.0	Upgrade to version 4.1.1 and then to 4.1.2 and then to 4.2.0
4.1.1	Upgrade directly to version 4.1.2 and then to 4.2.0
4.1.2	Upgrade directly to version 4.2.0
4.2.0	Upgrade directly to versions 4.3.1 and 4.3.2

#### Known issues

The following issues are known to exist in this release:

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None
DLPX-44359	Job cancellation may fail.	None
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

## Fixed issues

The following issues are fixed in this release:

<b>Delphix ticket number</b>	<b>Summary</b>
CTCHANA-1666	Backporting the password change through hooks issue to the master branch
CTCHANA-1660	remove dependency on /etc/SuSE-release for suse o/s platforms

## SAP HANA 2.0 plugin version 4.3.1 release notes

This is the release of the SAP HANA plugin version 4.3.1.

### New features

No new features.

### Plugin installation

Plugin to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

#### Supported DBMS versions

- SAP HANA Standard and Enterprise Edition 2.0 SPS03
- SAP HANA Standard and Enterprise Edition 2.0 SPS04
- SAP HANA Standard and Enterprise Edition 2.0 SPS05

#### Supported operating systems

- Red Hat Enterprise Linux (RHEL)
- S.u.S.E Linux

#### Red Hat Enterprise Linux (RHEL)

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 03 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 05 (Standard and enterprise editions)</b>
<b>Supported OS version</b>			
RHEL 7.3	Y	Y	N
RHEL 7.4	Y	Y	N
RHEL 7.5	Y	Y	N
RHEL 7.6	Y	Y	N
RHEL 8.1	N	N	Y

SUSE Linux

Supported DBMS version	SAP HANA 2.0 SPS 03 (Standard and enterprise editions)	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
Supported OS version			
SUSE 12 SP3	Y	Y	N
SUSE 12 SP4	Y	Y	N

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	HANA 3.4.5	HANA 3.5.0	HANA 3.5.1	HANA 4.0.0	HANA 4.1.0	HANA 4.1.1	HANA 4.1.2	HANA 4.2.0	HANA 4.3.0	HANA 4.3.1
6.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.5.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.6.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.7.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.8.x	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.

- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

#### Plugin upgrade path

Your version	Recommended upgrade path to 4.3.1
3.4.5	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
3.5.0	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
3.5.1	Upgrade to version 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
4.0.0	Upgrade to version 4.1.1 and then to 4.1.2 and then to 4.2.0
4.1.1	Upgrade directly to version 4.1.2 and then to 4.2.0
4.1.2	Upgrade directly to version 4.2.0
4.2.0	Upgrade directly to version 4.3.1

#### Known issues

The following issues are known to exist in this release:

Delphix Ticket Number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

## SAP HANA 2.0 plugin version 4.3.0 release notes

This is the release of the SAP HANA plugin version 4.3.0.

### New features

Below features are being provided:-

1. **Non-ingestion of backups into Delphix:** This means that database backups will not be transferred into the Delphix Engine during any of the operation. This will be driven on the basis of a checkbox that can be selected by the customer during dSource creation.
2. Support provided for log backups along with the data backups (only when non-ingestion has been chosen during dSource creation).
3. Ability to use Delphix provided storage for all virtualized tenant services. This is valid even for the user-created services outside the plugin.
4. Multiple HANA installations on the same VM will also be supported.
5. Support for Self-Service (Jetstream) has been certified with this release.
6. Certification of plugin support with HANA Standard and Enterprise Edition 2.0 SP05 on RHEL 8.1.

### Plugin installation

Plugin to support SAP HANA virtualization are not automatically included in the Virtualization Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

#### Supported DBMS versions

- SAP HANA Standard and Enterprise Edition 2.0 SPS03
- SAP HANA Standard and Enterprise Edition 2.0 SPS04
- SAP HANA Standard and Enterprise Edition 2.0 SPS05

#### Supported operating systems

- Red Hat Enterprise Linux (RHEL)
- S.u.S.E Linux

#### Red Hat Enterprise Linux (RHEL)

Supported DBMS version	SAP HANA 2.0 SPS 03 (Standard and enterprise editions)	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
Supported OS version			
RHEL 7.3	Y	Y	N
RHEL 7.4	Y	Y	N
RHEL 7.5	Y	Y	N

RHEL 7.6	Y	Y	N
RHEL 8.1	N	N	Y

SUSE Linux

Supported DBMS version	SAP HANA 2.0 SPS 03 (Standard and enterprise editions)	SAP HANA 2.0 SPS 04 (Standard and enterprise editions)	SAP HANA 2.0 SPS 05 (Standard and enterprise editions)
Supported OS version			
SUSE 12 SP3	Y	Y	N
SUSE 12 SP4	Y	Y	N

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	HANA 3.4.5	HANA 3.5.0	HANA 3.5.1	HANA 4.0.0	HANA 4.1.0	HANA 4.1.1	HANA 4.1.2	HANA 4.2.0	HANA 4.3.0
6.0.0.x	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y	Y	Y	Y	Y	Y
6.0.5.0	Y	Y	Y	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).

- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

#### Plugin upgrade path

Your version	Recommended upgrade path to 4.1.2
3.4.5	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
3.5.0	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
3.5.1	Upgrade to version 4.0.0 and then to 4.1.1 and then to 4.1.2 and then to 4.2.0
4.0.0	Upgrade to version 4.1.1 and then to 4.1.2 and then to 4.2.0
4.1.1	Upgrade directly to version 4.1.2 and then to 4.2.0
4.1.2	Upgrade directly to version 4.2.0
4.2.0	Upgrade directly to version 4.3.0

#### Known issues

The following issues are known to exist in this release:

Delphix ticket number	Summary	Workaround/Comments
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1/4.1.2/4.2.0 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

## SAP HANA 2.0 plugin version 4.2.0 release notes

This is the release of the SAP HANA plugin version 4.2.0.

### New features

With this release, we are including the support for `basepath_databackup` parameter. Backups created via plugin will now be created on the PATH specified by this parameter. This parameter can be defined at the system and at the tenant level. If this parameter has not been specified then default location will be used for creating the backups.

### Plugin installation

Plugin to support SAP HANA virtualization are not automatically included in the Virtualisation Engine deployment and are installed by Delphix Professional Services or Technical Support. A support case can be opened requesting installation by following this [link](#)

### Migration and compatibility

#### Supported DBMS versions

- SAP HANA Standard and Enterprise Edition 2.0 SPS03
- SAP HANA Standard and Enterprise Edition 2.0 SPS04

#### Supported operating systems

- Red Hat Enterprise Linux (RHEL)
- S.u.S.E Linux

#### Red Hat Enterprise Linux (RHEL)

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 03 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>

RHEL 7.6	Y	Y

#### SUSE Linux

<b>Supported DBMS version</b>	<b>SAP HANA 2.0 SPS 03 (Standard and enterprise editions)</b>	<b>SAP HANA 2.0 SPS 04 (Standard and enterprise editions)</b>
<b>Supported OS version</b>		
SUSE 12 SP3	Y	Y

Plugin/Delphix engine compatibility

The plugin should be installed on compatible Delphix Engines per the table below:

Delphix Engine	HANA 3.4.5	HANA 3.5.0	HANA 3.5.1	HANA 4.0.0	HANA 4.1.0	HANA 4.1.1
6.0.0.x	Y	Y	Y	Y	Y	Y
6.0.1.x	Y	Y	Y	Y	Y	Y
6.0.2.x	Y	Y	Y	Y	Y	Y
6.0.3.x	Y	Y	Y	Y	Y	Y
6.0.4.x	Y	Y	Y	Y	Y	Y

Compatibility limitations

The following functionalities, users are **not** supported:

- Multiple duplicate services.
- Point-in-Time (PiT) recovery.
- Scale-out source and target environments.
- High isolation level.
- Partitioning.
- Virtual to Physical (V2P).
- We have not validated SAP HANA Stream Replication (HSR), but it should work for the Staging Push ingestion mechanism.
- Pull-based ingestion mechanism using third-party backups tools.
- More than one instance of the same SAP HANA service.
- Switching between the Staging Push to Pull model.
- Non-database users/Low Privileged users/Users for which privileges need to be elevated.

Plugin upgrade path

Your version	Recommended upgrade path to 4.1.1
3.4.5	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1
3.5.0	Upgrade to version 3.5.1 and then upgrade to 4.0.0 and then to 4.1.1
3.5.1	Upgrade to version 4.0.0 and then to 4.1.1
4.0.0	Upgrade directly to version 4.1.1

**Known issues**

The following issues are known to exist in this release:

<b>Delphix ticket number</b>	<b>Summary</b>	<b>Workaround/Comments</b>
HANA-821	HANA SQL Port value should remain consistent for the life of VDB.	None.
DLPX-44359	Job cancellation may fail.	None.
CTCHANA-930	Upgrade from 3.4.5 to 3.5.0/3.5.1/4.0.0/4.1.1 needs a manual deletion of the existing tenant databases for disable/enable to work.	Drop the tenant database manually before enabling the VDB.

# Overview

## Overview Of Continuous Data

Learn the fundamentals of our data management platform. If you're new to Delphix, this section will help you understand and use our platform. Here, we will describe the core capabilities of Delphix, which include the following:

- **Delphix Engines:** what is a Delphix Engine and how do they work?
- **Database Linking:** what does linking a database mean and what is the impact?
- **Virtual Databases:** what are virtual databases and what is their architecture?

While using our platform, you will encounter new terminology and concepts that are important to understand. View our glossary as a reference for all concepts that are part of our product experience.

This section covers the following topics:

- [Delphix engine overview](#)
- [Getting started with data sources](#)
- [Delphix product Information](#)
- [Glossary of major Delphix concepts](#)
- [Product icon reference](#)

## Delphix engine overview

### What is Delphix?

Delphix is a data management platform that provides the ability to securely copy and share datasets. Using virtualization, you will ingest your data sources and create virtual data copies, which are full read-write capable database instances that use a small fraction of the resources a normal database copy would require.

### Overview

The Delphix Engine links to source physical databases via standard APIs and asks the source databases to send copies of their entire file and log blocks to it. The copy of the source database stored in the Delphix Engine, along with all incremental updates, is referred to as the dSource in Delphix terminology.

After the initial loading, the Delphix Engine maintains synchronization with source databases based on a user-defined policy. Once linked, Delphix maintains a Timeflow of the source database - a record of snapshots and log changes. From any time within that Timeflow, a virtual database (referred to in Delphix terminology as a VDB) can be instantly provisioned from the Delphix Engine. VDBs are served from the shared storage footprint of the dSource database Timeflow, so no additional storage is required.

Multiple VDBs can be provisioned from any point in time in a Timeflow, down to the second. Once provisioned, a VDB is an independent, read-write database, and changes made to the VDB by users or applications are written to new, compressed blocks in Delphix storage. VDBs can be provisioned from other VDBs, and the data within VDBs refreshed from its parent VDB or dSource.

## Getting started with data sources

Delphix enables agile data management, but our users first need to learn how to use our platform. Learn more about what data management looks like and how Delphix fits into the bigger picture. The following sections link to the Getting Started section of our Datasets category. This category also has explanations of other components of the Delphix platform, such as environments and policies.

## Managing data sources and syncing data

This section explains how to manage your data sources and create dSources. It hopes to answer questions such as: when you link a database, what happens? How does Delphix stay in sync with changes to a data source, and is there any impact to that source?

Learn about how we link to your data sources to enable fast and secure data management.

## Provisioning and managing virtual databases

This section details the virtual database (VDB) functionality and explains how you can create, manage, and utilize these data objects. This section will address questions such as: what is a virtual database, what makes them virtual? What does it mean to provision?

Learn all about the objects we create and refer to as virtual databases or VDBs.

## Delphix product Information

### Product overview

The Delphix Engine is delivered and maintained as a closed virtual software appliance. Like all virtual appliances, the Delphix Engine is a tightly integrated combination of a special-purpose operating system and business logic. A single engine can be configured for data virtualization or data masking.

The product is delivered as a closed appliance because there are dependencies between software components within the virtual appliance, which require end-to-end testing. As such, we do not provide administrative access to the operating system for any reason, including installing software, making customizations, or performing security scans. More details about the administrative model will be provided in later sections of this document.

### Product packaging

The DevOps Data Platform is delivered and maintained as a virtual software appliance. The mode of product delivery is dependent on the hosting hypervisor platform described in the table below:

Hypervisor Platform	Delivery Vehicle	Notes
VMware ESXi	OVA image	
Amazon AWS EC2	AMI image	Manual deployment to EC2
Amazon AWS EC2	Guest Machine Appliance	Amazon Marketplace
Microsoft Azure	Guest Machine Appliance	Azure Marketplace
Google Cloud Platform	Guest Machine Appliance	
Hyper V	Hyper image	

### Product updates, upgrades, and versions

Regardless of the initial packaging used to deploy the Delphix Engine, updates are supplied as a single upgrade image of the new release, and the same image can be used for any prior release from which an upgrade is supported. This upgrade image delivers a completely new appliance, including both the operating system and business logic components.

The upgrade process retains prior configuration and customer data such that no data or configuration is lost during the upgrade process. The upgrade process retains a copy of the previous version of the components for automatic recovery in case an upgrade fails. Installed versions older than the prior version are automatically deleted during the upgrade.

Delphix characterizes software as Major Release, Minor Release, and Maintenance Release in the Delphix Support Policies. These release types indicate the level of feature addition and change. For example, a Major Release may introduce significant new features, interface changes, and many bug fixes. A Maintenance Release or Patch Release

may deliver only a small number of bug fixes and no feature additions. In any case, each release delivers a complete upgrade image of the appliance.

There is no component patching of the Delphix Engine; fixes are delivered in new versions of the software as a new software appliance. There is no management of patches involved, and each Delphix Engine version is a consistent, tested virtual appliance.

## Product administration

Administration of the Delphix Engine is effected through product interfaces only. These interfaces provide for the proper configuration and testing of customer infrastructure components, such as network addresses, storage, Domain Name Service (DNS) servers, authentication servers (LDAP), etc. The interfaces also control the business logic and control of the overall platform, including how customer data is used and provisioned by the system.

Although the special-purpose operating system may be accessed by Delphix Support and Engineering personnel for the purpose of diagnostics and problem remediation, there are no customer-accessible interfaces at the operating system level. Customers are not provided access to the underlying operating system nor can any custom software be installed on the appliance.

## Product customization

The product has several endpoints allowing customization for improved integration with customer environments, local business workflow requirements, and alternative data sources.

Interface	Functional Area	Description
Data Plugins	Data Virtualization	Delivered by Delphix Services or Integration partners. These plugins allow for supporting additional data types including both structured and unstructured data.
Privilege Elevation Profiles	Data Virtualization	Delivered by Delphix Services or Integration Partners. These customizations allow for the use of privilege mechanisms other than sudo on Linux and Unix target environments. Sudo is the product default.
Hook Scripts	Data Virtualization	These customer-managed scripts allow for custom business logic to be applied to Oracle and SQL Server data sources and virtual databases. The scripts are not integrated into the appliance but are referenced and invoked by the product during data operations.

<b>Interface</b>	<b>Functional Area</b>	<b>Description</b>
Custom Algorithms	Data Masking	Delivered by Delphix Services or Integration Partners. Custom algorithms provide specialized data transformations to secure or anonymize sensitive data.

In addition to these endpoints, Delphix provides a robust set of application programming interfaces (APIs) that enable business automation and fully integrated data operations into client workflows.

## Glossary of major Delphix concepts

This glossary is your guide to exploring Delphix terms and definitions.

### Products

Term	Explanation
Delphix Virtualization	The Delphix product to deliver data on-demand to application developers and testers.
Continuous Compliance	The Delphix product to identify sensitive data and replace it with realistic but fictitious data.

### Functional product components

Term	Explanation
Delphix Management	The user interface for Delphix administrators to configure the product
Delphix Self-Service	The user interface designed specifically for project teams, application developers and testers.

### Delphix virtualization engine terms

#### Delphix virtualization concepts

Term	Explanation
Blocks or data blocks	Relational Database Management System (RDBMS) databases are based on files containing data blocks on disk. These are then backed up and restored with traditional database tools or virtualized with Delphix.
Dataset	A generic term for data in Delphix Virtualization. This can refer to sources or copies of data across any file/database.

Term	Explanation
Data source	<p>The set of data, typically a database, that you would like to create copies of. Data sources serve as the base from which you will create virtual copies. The source may be a database, a cluster of databases, or a file system.</p> <p>Not to be confused with a dSource, which is a virtualized, compressed duplicate of this database. (See below.)</p>
dSource	<p>A database that the Delphix Virtualization Engine uses to create and update virtual copies of your database. As a virtualized representation of your source data, it cannot be managed, manipulated, or examined by database tools. Because dSources are simply sourced data, you must provision a VDB in order to distribute/clone/test the data being pulled in. VDBs can also later be refreshed from the same or other points in time synced from the dSource.</p>
Delphix Connector	<p>A service that runs on a Windows host and enables the communication between the Delphix Virtualization Engine and the Windows Target Environment where it is installed.</p>
Environment	<p>The server and software required to run a data set. For example, a Linux system running Postgres. This may either be an individual instance, or a cluster like Oracle RAC.</p> <p>Environments can either be a source (where data comes from), staging (where data are prepared/masked) or target (where data are delivered and used by developers and testers).</p>
Hooks	<p>Mechanisms by which Delphix can run scripts or call external processes during common Delphix operations. For example, running a particular script during every VDB provision.</p>

Term	Explanation
HostChecker	<p>A standalone program that validates that environments are configured correctly before the Delphix Virtualization Engine uses them for syncing from data sources or provisioning VDBs.</p> <p>HostChecker should run before adding any Environment to your Delphix Virtualization Engine. It is available to download from the HostChecker subfolder at <a href="https://download.delphix.com">download.delphix.com</a>.</p>
Replication	<p>Replication enables creating a copy of specific data sets on a second Delphix Virtualization Engine. This is used both for disaster recovery purposes as well as scale-out. Replication is configured on a source engine and the data are moved to a secondary engine. The source engine then sends incremental updates manually or according to a schedule.</p>
Snapshots	<p>Snapshots represent the state of a dataset at a specific moment in time. Snapshots are created from policies or are generated by manual creation. Snapshots allow you to choose a point in time from which to provision, refresh, or rollback.</p> <p>If you have LogSync enabled, you can provision refresh or rollback from a point in time between the snapshots endpoints.</p> <p>Note: Point in time provisioning is also dependent on log retention.</p>
SnapSync	<p>The standard process for importing data from a source into the Delphix Virtualization Engine. An initial SnapSync is performed to create a dSource on the Delphix Virtualization Engine. Incremental SnapSyncs are performed to provide additional points in time to the dSource on the Delphix Virtualization Engine.</p>
LogSync	<p>This feature enables the ingestion and retention of more granular (log-based) source change data. This more granular change data allows for VDB point-in-time provision, refresh, or rollback.</p>

<b>Term</b>	<b>Explanation</b>
Validated Sync	The process that runs on a staging database within a Staging Environment executes database cleanup and preparation. This is recommended and results in faster and more predictable provisions and refreshes, and which executes either before a snapshot is taken (SQL Server) or after a snapshot is taken (Oracle).
Timeflow	The collection of snapshots for a particular data set. Virtual databases can be provisioned from any snapshots in a Timeflow.
Unstructured files	Data stored in a filesystem that is not part of a database. Unstructured files can consist of anything from a simple directory to the root of a complex application like Oracle E-Business Suite. Like with other data types, you can configure a dSource to sync periodically with a set of unstructured files external to the Delphix Virtualization Engine.
Virtual Database (VDB)	A database provisioned from either a dSource or another VDB which is a full read/write copy of the source data. A VDB is created and managed by the Delphix Virtualization Engine.
Virtual dataset	A comprehensive term that includes VDBs and virtualized files.
V2P	Shorthand for “Virtual-to-Physical Provisioning”. This refers to the process of moving a dataset from Delphix back to a full-size database. This can be used in DR purposes or as part of a final performance test, matching the production systems.

## TDE definitions

The following terms are used by Delphix and are summarized here for clarity.

<b>Term</b>	<b>Definition</b>
Artifact directory	Directory on the target system (not on Delphix storage) which stores keys needed to support Delphix workflows on TDE-enabled vPDBs. It is located under the toolkit directory.

Term	Definition
Auxiliary container database (CDB)	Provisioning an Oracle vPDB requires running recovery to bring the snapshotted datafiles into a consistent state. This needs to be done in the context of a container database, which is created on the target system. After the recovery is complete, the vPDB is unplugged and plugged into the target container, and the auxiliary container is deleted.
Exported keyfile	File located on the target Oracle host which contains keys that have been exported from the Keystore. It is encrypted with a secret that is specified when it is exported. The exported keyfile itself cannot be used as a Keystore, but its contents can be imported into a new Keystore.
Key rotation	Process for changing the master encryption key in the keystore via ADMINISTER KEY MANAGEMENT SET KEY. This does not remove the original key, rather it adds a new key to the wallet and future data will be encrypted with the new key.
Keystore/wallet	File found on the Oracle host which stores the keys used to encrypt and decrypt the internal table keys in a database. Every keystore has a password that is set when it is first created and must be supplied for operations on it.
Parent Keystore	Keystore with the keys used to encrypt the dSource PDB files.
Target Keystore	Keystore for the target CDB into which the TDE-encrypted vPDB is plugged.

## Dataset operations

The terms below describe actions you can perform on a Delphix Virtualization Engine.

Term	Explanation
Link	The process of establishing a relationship between a data source and the Delphix Virtualization Engine. After linking a data source, the Delphix Virtualization Engine can import data periodically and manage it as it evolves over time. In the user interface, this accomplished via "Add dSource."
Mask	Masking replaces sensitive data with fictitious data in non-prod environments (such as VDBs). It provides realistic data with which to work while reducing security risks. For more details about masking, see <a href="#">Masking Terms</a> below.
Migrating a VDB	Moving a VDB to a new Target Environment.
Provision	Create a new VDB from a dSource or VDB.
Refresh	Refreshing a VDB will re-provision it from the dSource. As with the normal provisioning process, you can choose to refresh the VDB from a Snapshot or a specific point in time. Refreshing a VDB will delete any changes that have been made to the VDB prior to the refresh operation; you are essentially resetting it to the state you select during the refresh process.
Rewind	Rewinding a VDB rolls it back to a previous point in its Timeflow. The VDB will no longer contain changes that occurred after the rewind point.
Staging Push	Allow users to control the staging database restore and the state of the restored staging database.
Disable	Remove all evidence of a specific VDB from a target environment. This action deletes the database and network pathway(s) on the target host. But it leaves the current VDB filesystem and snapshot(s) intact in Delphix Virtualization Engine so that VDB can later be enabled on a chosen target environment.
Enable	Establish the network pathway for the VDB between Delphix Virtualization Engine and the appropriate target environment, then start the specific VDB database.

Term	Explanation
Stop	Leave network pathway (e.g., NFS or iSCSI) in place on the target environment for VDB, but stop the specific VDB database on the target environment.
Start	Start a specific VDB database on the target environment. This will result in no action for the network pathway and is assumed to be in place already.
Delete	Remove all evidence of specific VDB from the target environment and the Delphix Virtualization Engine. This operation is intentionally destructive.

### Delphix virtualization users and privileges

Object	User Privileges	Group Privileges
Reader	Access statistics on the dSource, VDB, or Snapshot such as usage, history, and space consumption	Access statistics on all dSources, VDBs, or Snapshots in the group such as usage, history, and space consumption
Provisioner	<ul style="list-style-type: none"> <li>• Access statistics on the dSource, VDB, or Snapshot such as usage, history, and space consumption</li> <li>• Provision VDBs from owned dSources and VDBs</li> </ul>	<ul style="list-style-type: none"> <li>• Access statistics on all dSources, VDBs, or Snapshots in the group such as usage, history, and space consumption</li> <li>• Provision VDBs from all dSources and VDBs in the group</li> </ul>

Object	User Privileges	Group Privileges
Owner	<ul style="list-style-type: none"> <li>• Provision VDBs from owned dSources and VDBs</li> <li>• Perform Virtual to Physical (V2P) from owned dSources</li> <li>• Access the same statistics as a Reader</li> <li>• Refresh or Rollback VDBs</li> <li>• Take Snapshots of dSources and VDBs</li> </ul>	<ul style="list-style-type: none"> <li>• Provision VDBs from all dSources and VDBs in the group</li> <li>• Refresh or Rollback all VDBs in the group</li> <li>• Snapshot all dSources and VDBs in the group</li> <li>• Perform Virtual to Physical (V2P) from owned dSources</li> <li>• Apply custom policies to dSources and VDBs</li> <li>• Create template policies for the group</li> <li>• Assign Owner privileges for dSources and VDBs</li> <li>• Access the same statistics as a Provisioner, Data Operator, or Reader</li> </ul>
Data operator	<ul style="list-style-type: none"> <li>• Access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption</li> <li>• Refresh or rollback VDBs</li> </ul>	<ul style="list-style-type: none"> <li>• Access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption</li> <li>• Refresh or rollback all VDBs in the group</li> </ul>
Administrator	<p>Manage all data objects: dSources, virtual databases (VDBs), users, groups, and related policies and resources." The `admin` user manages the Delphix Virtualization Engine using either the browser-based Delphix Management application or the Command Line Interface (CLI).</p>	<p>Has privileges over all objects and users.</p>

Object	User Privileges	Group Privileges
sysadmin	Can perform typical system administration duties such as: modifying NTP, SNMP, SMTP settings; managing storage; downloading support logs for the Delphix Virtualization Engine, and performing upgrades and patches. The sysadmin user launches the initial Delphix Setup configuration application and has access to the Command Line Interface (CLI).	Has privileges for storage, upgrades, network, etc.

### Types of notification

Type	Notification
Event	Completion of some action in the Delphix Virtualization Engine. Examples include user-initiated tasks such as snapshots or VDB provisioning, policy-based tasks, and background monitoring and maintenance tasks.
Alert	<p>Caused by a single event on a Delphix Virtualization Engine. Also known as a System Event, and viewable through the System Event Viewer. Examples include warnings on source/target environment settings, recoverable errors, or incorrect connection settings.</p> <p>Alert Levels: Informational, Warning, Critical</p>
Fault	<p>A persistent event on a Delphix Virtualization Engine that remains until the issue is resolved. The fault may be marked resolved automatically or require that it be resolved manually. Selecting to Ignore a fault will also ignore future faults of that exact type against the same object.</p> <p>System faults describe states and configurations that may negatively impact the functionality of the Delphix Virtualization Engine and which can only be resolved through active user intervention.</p> <p>Examples: Delphix Virtualization Engine storage failure, communication failures between the Delphix Virtualization Engine and a source or target environment/host</p> <p>Fault Levels: Warning, Critical</p>

## Delphix self-service terms

Term	Explanation
Administrator	<p>Has full access to all report data and can configure and administer Delphix Self-Service. Additionally, can use the Delphix Virtualization Engine to:</p> <ul style="list-style-type: none"> <li>• add/delete reports</li> <li>• add/delete users</li> <li>• change tunable settings</li> <li>• add/delete tags</li> <li>• create and assign data templates and containers</li> </ul>
Bookmark	<p>A logical reference to a point in time on a branch. You can use it as a point from which to fork new branches. It can also be the target of policies – for example, you can arrange to keep this bookmark for two years.</p> <p>Bookmarks are a way to mark and name a particular moment of data on a timeline. You can restore the active branch's timeline to the moment of data marked with a bookmark. You can also share bookmarks with other Delphix Self-Service users, which allows them to restore their own active branches to the moment of data in your container. The data represented by a bookmark is protected and will not be deleted until the bookmark is deleted.</p>
Branches	<p>Branches are task-specific groupings you can create within a data container. A branch is used to track a logical task and contains a timeline of the historical data for that task. As you work within your data container, you can create more branches overtime to run or complete separate tasks.</p> <p>Branches represent a logical sequence of activity, separate from the underlying data lineage. This is the main concept introduced in the core engine and forms the basis of many higher-level primitives. Branches:</p> <ul style="list-style-type: none"> <li>• Can have only one timeline active at any time</li> <li>• Can be user-visible (e.g. exported to a user target) or implementation (e.g. just a staging source to run a series of transformations)</li> </ul>
Branch group/target group	<p>A collection of multiple Branches that are treated as a single entity. The system can determine compatibility automatically, or a template can be used to create more complex orchestration.</p>

Term	Explanation
Branch timeline	A dynamic point-in-time interface for user actions within the Branch. Common activities include re-setting Data Sources to run a test, refreshing the Data Container with the most current source data, and bookmarking data to share or track interesting moments of time along the branch timeline.
Data container	<p>Consists of one or more Data Sources, such as databases, application binaries, or other application data. Allows users to:</p> <ul style="list-style-type: none"> <li>• Undo any changes to their application data in seconds or minutes</li> <li>• Have immediate access to any version of their data over the course of their project</li> <li>• Share their data with other people on their team, without needing to relinquish control of their own container</li> <li>• Refresh their data from production data without waiting for an overworked DBA</li> </ul>
Data template	Created by the Delphix Administrator, data templates consist of the data sources users need in order to manage their data playground and their testing and/ or development environments. Data templates serve as the parent for a set of data containers that the administrator assigns to Delphix Self-Service users. Additionally, data templates enforce the boundaries for how data is shared. Data can only be shared directly with other users whose containers were created from the same parent data template.
Data User	Delphix Self-Service data users have access to production data provided in a data container. The data container provides these users with a playground in which to work with data using the Self-Service Toolbar.

## Product icon reference

This topic illustrates the icons that appear on dSources and virtual databases (VDBs) in the Delphix Engine graphic user interface and describes the meaning of each, along with tips for clearing those that represent errors.

Icon	Description
	Environment
	Host
	Cluster
	dSource
	VDB
	Masked VDB
	vFiles
	Live Source
	Universal control for adding, creating users and objects
	Provision a Virtual Database (VDB)
	Refresh a VDB
	Take a snapshot
	Rewind or roll back a VDB to a point in time
	Copy Virtual Database to a physical database (V2P)
	Open Log Sync to create a dataset from a point in time
	Filter control to narrow the results in a list view
	Toggle to expand the current state

Icon	Description
<input type="checkbox"/>	Toggle to collapse current state
<input type="checkbox"/>	Timeflow view selector
<input type="checkbox"/>	There is a warning fault associated with the dataset
<input type="checkbox"/>	There is a critical fault associated with the dataset

# Deployment

This section covers the necessary requirements to deploy the Delphix Engine across multiple different environments. Specific technical requirements for both on-premise and cloud deployments can be found under each platform topic (VMware, AWS, Azure, Google Cloud, etc.). This section covers the following topics:

- [Standard deployment architecture](#)
- [Checklist of information required for installation and configuration](#)
- [Network connectivity requirements](#)
- [Installation and initial system configurations](#)
- [Validating host deployment with host Checker](#)
- [Deployment for VMware](#)
- [Deployment for KVM](#)
- [Deployment for Hyper-V](#)
- [Deployment for AWS EC2](#)
- [Deployment for Microsoft Azure](#)
- [Deployment for Google cloud platform](#)
- [Deployment for OCI](#)
- [Deployment for IBM cloud](#)
- [Hotfix information](#)

## Standard deployment architecture

### Overview

At a high level, Continuous Data functions to efficiently ingest data off of a source host by creating a compressed copy of that data, called a dSource, on the Delphix Engine. From there, the Delphix Engine can easily create multiple virtual databases (VDBs) on a target host with a marginal increase in storage. From an architecture perspective, the diagram below details how an engine interacts with an organizations infrastructure.

### Delphix Architecture - Infrastructure Level

Architectural diagram of a common Delphix deployment (configurations vary depending on RDBMS platforms).

On an infrastructure level, Continuous Data relies on a Source, Staging, and Target Hosts, in addition to the Delphix Engine needing specific compute requirements (outlined in the platform-specific requirements section). Storage Requirements, like compute, vary by host type and are outlined in subsequent sections. Staging and Target host storage is provided from the Delphix Engine, which is mounted over the network similar to any Target host (NFS/iSCSI).

## Checklist of information required for installation and configuration

### Overview

This article describes the information required for the initial installation and configuration of the Delphix Engine.

The **InstallWorkbooks** articles list all the values that need to be captured, as well as sample values. Choose the workbook for the corresponding hypervisor. In addition to required values, the InstallWorkbooks also lists useful data to document as part of the installation.

- [InstallWorkbook AWS](#)
- [InstallWorkbook VMware](#)
- [InstallWorkbook Azure](#)

### Hypervisor specific options

As a virtual appliance, Delphix supports a number of different hypervisors and configurations. The choice of hypervisor and network configuration will determine what configurations are needed for the first step in the installation of Delphix.

Attribute	Sample data	Used with the following hypervisor options			
		VMware with Static IP	VMware with DHCP	AWS	Azure
Name	mydelphix1	*	*	*	*
Gateway IP	192.168.0.1	*	*	*	*
Root Volume Size	127G	*	*	*	*
ESX Hostname	thx1138	*	*		
Domain	mydomain.com	*		*	*
DNS server IP(s), comma-separated	10.80.1.1, 10.80.1.2	*		*	*
Static IP and Subnet Mask in CIDR Notation	172.16.180.130/24	*			
Number of vSCSI Controllers	4	*			

Attribute	Sample data	Used with the following hypervisor options			
VMDK/RDMs and Sizes	SAN 03- 3 TB, SAN04-3 TB, SAN05-3 TB & SAN06-3 TB	*			
Virtual Private Cloud (VPC) Name	vpc-673822a23			*	
Subnet	subnet-748391e26			*	
Auto-assign Public IP	disable			*	
EC2 instance type	r3.8xlarge			*	
Security Groups	sg-78sdg99879, sg-8798s77009			*	
Root Volume Type	Magnetic			*	
Number of EBS volumes	4			*	
Size of EBS volumes	500G			*	
Type of EBS volumes	Provisioned IOPS SSD			*	
IOPS set on each volume	5,000			*	
Encryption on EBS volumes	TRUE			*	
Virtual Network (vnet)					*
Subnet					*
Network Interface w/ Static Public IP					*

Attribute	Sample data	Used with the following hypervisor options			
VM Size	Example: D8s_v3				*
Network Security Group					*
OS Disk	127 GB - Premium SSD				*
Data Disks	Premium SSDs				*

### Optional information required for initial configuration

Class	Attribute	Sample data
Time	NTP Servers (Highly Recommended)	172.16.180.10, 172.16.180.11
	Timezone	US/Pacific
Serviceability (Highly Recommended)	Enable Phone Home? (Highly Recommended)	Yes
	Web Proxy Server IP Address	192.168.1.200
	Web Proxy Server Port	8080
	Web Proxy Server Username (If Required)	user
	Web Proxy Server Password (If Required)	***
	Enable SMTP Server (Highly Recommended)	Yes
	SMTP Server IP Address	192.168.22.22

Class	Attribute	Sample data
	SMTP Server Port Number	25
	SMTP Server From Email Address	<a href="mailto:delphix@hostname.mydomain.com">delphix@hostname.mydomain.com</a>
	SMTP Server User (Optional)	user
	SMTP Server Password (Optional)	***
	SMTP Use TLS Authentication? (Optional, Default=No)	No
	SMTP Send Timeout (Optional, Default=60)	60
Authentication (Highly Recommended)		
	LDAP Server IP Address	192.168.7.7
	LDAP Server Port	389 (636 for SSL)
	Protect LDAP traffic with SSL/TLS (true   false)	false
	LDAP SSL Authentication (SIMPLE   DIGEST_MD5)	SIMPLE
SNMP Integration		
	SNMP Server IP Address	192.168.77.156
	SNMP Server Port	162
	SNMP Community	mycommunity
	SNMP Use INFORM Instead of TRAP	false

Class	Attribute	Sample data
	SNMP Severity Level (INFORMATIONAL, WARNING, CRITICAL)	CRITICAL
Splunk integration (Highly recommended)		
	Splunk Server IP address	192.168.8.8
	Splunk Server HEC Port Number	8088
	Splunk HEC Token	12345678-1234-1234-1234-1234567890AB
	Index Name for Events	delphix_events
	Index Name for Metrics	delphix_metrics
ADMIN		
	Email Address	<a href="mailto:u12345@mydomain.com">u12345@mydomain.com</a>
SYSADMIN		
	Email Address	<a href="mailto:u12345@mydomain.com">u12345@mydomain.com</a>

## Network connectivity requirements

### Overview

This topic covers the general network and connectivity requirements for the Delphix Engine, including connection requirements, port allocation, and firewall and Intrusion Detection System (IDS) considerations. For platform-specific network and connectivity requirements, see relevant topics under the **Requirements** article for each platform.

### General outbound from the Delphix engine port allocation

Protocol	Port Numbers	Use
TCP	25	Connection to a local SMTP server for sending email
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
UDP	162	Sending SNMP TRAP messages to an SNMP Manager
TCP	443	HTTPS connections from the Delphix Engine to the Delphix Support upload server
TCP/UDP	636	Secure connections to an LDAP server
TCP	8415	Connections to a Delphix replication target (see <a href="#">Configuring Replication</a> )
TCP	50001	Connections to source and target environments for network performance tests

## General inbound to the Delphix Engine port allocation

Protocol	Port Number	Use
TCP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
UDP	161	Messages from an SNMP Manager to the Delphix Engine
TCP	443	HTTPS connections to the Delphix Management Application
TCP	8415	Delphix Session Protocol connections from all DSP-based network services including Replication, SnapSync for Oracle, V2P, and the Delphix Connector.
TCP	50001	Connections from source and target environments for network performance tests via the Delphix CLI

## Firewalls and intrusion detection systems (IDS)

Production databases on source environments (for dSources) are often separated from the non-production environment by firewalls. Firewalls can add milliseconds to the latency between servers. Accordingly, for best performance, there should be no firewalls between the Delphix Engine and the virtual database (VDB) target environments. If the Delphix Engine is separated from a source environment by a firewall, the firewall must be configured to permit network connections between the Delphix Engine and the source environments for the application protocols (ports) listed above.

Intrusion detection systems (IDSs) should also be made permissive to the Delphix Engine deployment. IDSs should be made aware of the anticipated high volumes of data transfer between dSources and the Delphix Engine.

## Setting up network access to the Delphix engine

### Overview

This article outlines the procedure for setting up network access to the Delphix Engine. Follow the initial installation instructions in [Installing the Delphix engine](#) before addressing this procedure.

### Procedure

1. Power on the Delphix Engine and open the Console.
2. Wait for the Delphix Management Service and Delphix Boot Service to come online. This might take up to 10 minutes during the first boot. Wait for the large orange box to turn green.
3. Press any key to access the sysadmin console.
4. Enter `sysadmin` for the username and the password.
5. A description of available network settings and instructions for editing will be shown.

#### Delphix Engine Network Setup

To access the system setup through the browser, the system must first be configured **for** networking in your environment. From here, you can configure the primary **interface**, DNS, hostname, and **default** route. When DHCP is configured, all other properties are derived from DHCP settings.

To see the current settings, run `"get."` To change a property, run `"set <property>=<value>."` To commit your changes, run `"commit."` To exit **this** setup and **return** to the standard CLI, run `"discard."`

`defaultRoute` IP address of the gateway **for** the **default** route -- **for** example, `"1.2.3.4."`

`dhcp` Boolean value indicating whether DHCP should be used **for** the primary **interface**. Setting **this** value to `"true"` will cause all other properties (address, hostname, and DNS) to be derived from the DHCP response

`dnsDomain` DNS Domain -- **for** example, `"delphix.com"`

`dnsServers` DNS server(s) as a list of IP addresses -- **for** example, `"1.2.3.4,5.6.7.8."`

`hostname` Canonical system hostname, used in alert and other logs -- **for** example, `"myserver"`

`primaryAddress` Static address **for** the primary **interface** in CIDR notation -- **for** example, `"1.2.3.4/22"`

Current settings:

```
defaultRoute: 192.168.1.1
dhcp: false
dnsDomain: example.com
dnsServers: 192.168.1.1
hostname: Delphix
primaryAddress: 192.168.1.100/24
```

6. Configure the `hostname` . If using DHCP, this step can be skipped.

```
delphix network setup update *> set hostname=<hostname>
```

Use the same hostname entered during the server installation.

7. Configure DNS. If using DHCP, this step can be skipped.

```
delphix network setup update *> set dnsDomain=<domain>
delphix network setup update *> set dnsServers=<server1-ip>[,<server2-ip>,...]
```

8. Configure either a static or DHCP address:  
DHCP configuration

```
delphix network setup update *> set dhcp=true
```

Static configuration

```
delphix network setup update *> set dhcp=false
delphix network setup update *> set primaryAddress=<address>/<prefix-len>
```

 The static IP address must be specified in CIDR notation (for example, `192.168.1.2/24` ).

9. Configure a default gateway. If using DHCP, this step can be skipped.

```
delphix network setup update *> set defaultRoute=<gateway-ip>
```

10. Commit the changes. Use the `get` command prior to committing to verify the desired configuration.

```
delphix network setup update *> commit
Successfully committed network settings. Further setup can be done through the
browser at:
```

```
http://<address>
```

Type `'exit'` to disconnect, or any other commands to `continue` using the CLI.

11. Check that the Delphix Engine can now be accessed through a Web browser by navigating to the displayed IP address, or hostname if using DNS.

12. Exit setup.

1. `delphix> exit`

## Installation and initial system configurations

This section covers the following topics:

- [Initial setup](#)
- [Customizing the Delphix engine system settings](#)
- [Installing an OVA or AMI](#)

## Initial setup

### Overview

Delphix runs as a virtual appliance deployed in various types of platforms, as outlined in these **Deployment** articles. When first logging into an instance, the setup wizard will help with initial configurations for network, storage, authentication, and more. This article describes each step in the setup process and will outline and the various options available.

When first connecting to the Delphix Engine via any supported browser, enter the default sysadmin login; the credentials for username/password are sysadmin/sysadmin. On the first login, there will be a prompt to change the initial default password for security purposes.

**i** A login failure issue could occur if the Delphix Engine clock is not in sync with the IDP clock. To resolve the issue, either use the NTP clock or set up the skew time property in SSO (Single Sign-On) configuration.

### Welcome

The Welcome tab asks users to select the engine type for setup, and choose from Virtualization or Masking. This document explains the setup for Virtualization engines. For Masking engines, please visit the [Masking documentation](#).

### Administrators

Each Delphix Virtualization engine has two default accounts:

- System Administrator: 'sysadmin' with a password that users can define. This will be the system administrator for the instance.
- Engine Administrator: 'admin' with a password that users can define. This is typically a DBA who will administer all the data managed by the instance.

Provide an email address and password for both users at the administrator's step of the setup.

Each Delphix Masking engine has the following default account:

- Masking Administrator - "admin" with a user-defined password. This will be the Masking administrator responsible for setting up users and other administrative actions in Masking. This is only applicable if Masking was selected.

### Time

The Delphix Engine leverages its time setting to determine policies and actions that take place within the application. Manually set the time or choose from an NTP server, an explanation of these options are shown below.

Option	Notes
Set NTP Server (recommended)	After selecting this option, select an NTP server from the list, or click Add NTP Server to manually enter one or more server(s).  When configuring a Delphix Engine on VMware, be sure to configure the NTP client on the host to use the same servers that are entered here.
Manually Select Time and Date	Click <b>Use browser time and date</b> option to set the system time, or select the date and time by using the calendar and clock icons.  If this option is selected, the date and time will persist as the local time, even if time zones are changed.

### Network

The initial network configuration will be pre-populated based on the deployment platform used for Delphix. For VMware deployments, Delphix defaults to the VMXNET3 network adapter.

Select 'Settings' for each Network Interface to manage the following options:

Option	Notes
DHCP or Static network addressing	For Static addressing, enter an IP Address and Subnet Mask. The static IP address must be specified in CIDR notation (for example, 192.168.1.2/24).
Jumbo Frames	This setting is highly recommended. VMXNET3 supports Ethernet jumbo frames, which can be used to maximize throughput and minimize CPU utilization.
Routing	A default gateway will be specified in this section.
DNS Services	Enter a DNS Domain Name and DNS Server to be used for this engine.

## Network security

Delphix installs certificates signed by the engine’s Certificate Authority. Users have the ability to manage their own certificates for HTTPS and DSP (Delphix Session Protocol) connections to and from the Delphix Engine. You can add or modify certificates and certificate signing requests (CSRs) via the ‘...’ option.

When you update the Certificate Authority certificate, your HTTPS and DSP certificates will be automatically updated.

For more information please refer to [Certificate management](#) in the Security section of this documentation.

## Storage

### Storage for engines backed by block devices

The Delphix Engine automatically discovers and displays storage devices. For each device, confirm that Usage Assignment is set to Data.

You can associate additional storage devices with the Delphix Engine after initial configuration, as described in [Adding, expanding, and removing storage devices](#).

There are two options for storage disk usage assignment:

1. **Enabled:** Once you set the storage unit assignment for a disk and save the configuration, you cannot change it again.
2. **Unassigned:** These are disks being held for later use.

Configure at least four disks for the storage of user data. This makes the Delphix Engine storage manager function more efficient since duplicated metadata can be distributed across multiple disks.

### Delphix cloud engines (AWS S3 and Azure-Blob storage)

- Select one of the three options from the drop-down menu: **Block**, **S3 Object**, and **Azure Blob** Storage. Block storage usage is covered in the previous section, Cloud Engines should select the corresponding storage type. We only support the Standard Performance tier for Azure-Blob.

- Once one of these options is selected, enter the corresponding information with the fields that appear.

- Enter the amount of data that you would like to store on the engine. The size would be similar to the total storage on a traditional engine. Delphix Cloud engines provide the following advantages
  - S3 only charges for the amount of storage used (In traditional EBS-backed engines, AWS charges based on provisioned storage) . Eg: if the size here was 10TB but the engine only uses 1TB, then AWS charges only for the 1TB of storage used.
  - Increasing or reducing this number is simple post setup. It involves editing this number from the sysadmin login (Size cannot be reduced to a number lesser than what the Delphix engine is already using)
  - This number acts as a quota in case you do not want s3 storage and costs to grow beyond a certain number.
- Enter the Base URL, Region, and Bucket that you want to use for the engine. For Azure-Blob, there is no region to configure. In addition, “endpoint” is an optional field (hidden in the Advanced tab).
- For S3, select whether the engine should access the storage bucket via Role ([Instance profile](#)) or via [Access Key](#). For Azure-Blob, select whether the engine should access the storage bucket via [Managed Identities](#) or via [Access Key](#).
- Make sure to **Test** the connection to confirm that the EC2 instance can access the bucket.

### Block storage for cache

- EBS as cache is used to reduce latencies for frequently read data and as temporary storage for synchronous writes before the writes are sent to s3.
- **Sizing:** If you already know the size of the frequently accessed data, then size the cache equal to (size of frequently accessed data + Extra 10% for bookkeeping purposes), If not, you can start off with sizing the cache to 50% of the size of all dsources that will be added to the engine.
- [Refer to section "Storage for Engines backed by EBS" for the steps to set up EBS as cache devices.](#)

### Outbound connectivity

#### Web proxy

If a Web Proxy Server is necessary for your environment, select ‘Configure web proxy’ and enter the hostname and credentials for that server.

## Phone home

The support and phone home bundles contain metadata from the Delphix Engine, but do not include the customer data that has been ingested into the engine. Redaction of known PII data (e.g. names and email addresses for Delphix users) is done on-engine before bundles are uploaded, and again after bundles are uploaded to Delphix to ensure that the latest redaction rules are applied to each bundle without requiring the engine to be continually upgraded. There may be some limited environment data in the bundle (e.g., IP addresses and database names) that are needed for debugging purposes. Support bundles are automatically deleted within 30 days after the support case is closed, or 30 days after upload, whichever comes later.

## Enabling/Disabling phone home

Enabling this option sends information to Delphix periodically over HTTPS (SSL). This data is securely managed by the internal team for product analysis and improvements. This feature requires a connection to the internet and will use the Web Proxy Server configuration.

Perform the following steps to enable/disable phonehome.

1. Login to the Delphix Virtualization engine setup using the sysadmin credentials.
2. From the Outbound Connectivity widget, click **Modify**.
3. To enable phonehome, select the checkbox before the **Enable phone home service** option. If enabled, this service will automatically send a stream of anonymous, non-personal metadata describing user interaction with the product's user interface.
4. To disable, deselect the checkbox before the **Enable phone home service** option.
5. Click **Save** to save for the settings.

## User-click analytics

User-click Analytics is a lightweight method to capture how users interact with Delphix product UIs, allowing Delphix to collect browser-based, user-click data. Delphix does not collect, transmit, or store any personally identifiable information (PII) such as email addresses, IP addresses, usernames, etc.

## SMTP server

Select **Use an SMTP Server** and enter the server name or IP address to enable email notifications for events and alerts. When a critical fault occurs with the Delphix Engine, it will automatically send an email alert to the admin user. Make sure to configure the SMTP server so that alert emails can be sent to this user. See **System Faults** for more information.

## Authentication

On the Authentication page, configure authentication protocols such as LDAP and SAML/SSO. See [User and authentication management](#) for further details.

### LDAP

To avoid configuration issues, consult with the lightweight directory access protocol (LDAP) administrator before attempting to set up LDAP authentication of users for the Delphix Engine. When configuring LDAP, provide an LDAP Server. Two authentication methods are currently supported: **SIMPLE** and **DIGEST\_MD5**.

Select to Protect LDAP traffic with SSL/TLS if desired. This option requires to import the server certificate. If LDAP has been set up as an authentication service for the Delphix Engine, add new users with LDAP as their authentication mechanism. For more information, see the [User groups](#) article.

### SAML/SSO

To enable SAML/SSO, there are two properties to set:

1. Audience Restriction: The audience restriction must be set to the entity id configured in the Delphix Server via the Delphix Setup. Its default value is **https://<Delphix Server ID>**, where <Delphix Server ID> is a 36-character hexadecimal string of the form xxxxxxxx-xxxx-xxxx-xxxxxxxxxxx. See [Determining the Delphix server ID and host name](#) for more on the Delphix Server ID. If the Delphix Engine does not exist or is unreachable, enter a temporary value (such as delphix-sp-id) which must later be replaced by the actual Delphix Server ID.
2. IdP Metadata: an XML document that must be exported from the application created in the IdP. Paste its contents into the provided field.

## Kerberos

The Kerberos page allows for Kerberos authentication to communicate between hosts connected with Delphix. Enabling this option will allow Kerberos key-based authentication when adding new environments to Delphix.

1. **Realm:** the domain over which a Kerberos authentication server has the authority to authenticate a user, host, or service.
2. **Principal:** a unique identity to which Kerberos can assign tickets.
3. **Keytab:** a file containing pairs of Kerberos principals and encrypted keys (which are derived from the Kerberos password).

## Registration

As described in [Registration management](#), registration allows Delphix Support to access the engine, properly diagnose, and identify any issues during support cases. If the Delphix Engine has access to the internet, auto-register the Delphix Engine with Delphix Support credentials in the 'Online Registration' section.

If external connectivity is not immediately available, perform the manual registration.

1. Copy the Delphix Engine registration code displayed.
2. Transfer the Delphix Engine's registration code to a workstation with access to the external network Internet. For example, e-mail the registration code to an externally accessible email account.
3. On a machine with access to the internet, use a browser to navigate to the **Delphix Registration Portal** at <http://register.delphix.com>.
4. Log in with Delphix support credentials.
5. Paste the Registration Code.
6. Click **Register**.

 The Delphix Engine will work without registration, but it is recommended to register each engine as part of the setup. Failing to register the Delphix Engine will impact its supportability.

## Summary

The final summary tab will enable a review of the configurations for each page in the setup tutorial. Confirm that everything looks correct, and click submit to complete the setup.

## After Setup

- After the configuration is complete, the Delphix Engine will restart and launch the browser-based Delphix Management application.
- After the Delphix Management application launches, the admin can log in using the initial default username admin and the initial default password Delphix. On the first login, there will be a prompt to change the initial password.

## Customizing the Delphix engine system settings

### Overview

This article describes how to customize the initial system setup requirements for memory, number of CPUs, storage disks, and network configuration. The OVA file used to install the Delphix Engine is configured for the minimum system requirements. These can be customized to match the capabilities of a specific system.

### Procedure

1. Shut down the guest operating system and power off the Delphix Engine.
2. Under **Getting Started**, select **Edit Virtual Machine Settings**.
3. The system settings can now be customized.

Setting	Options
Memory Size	Set to 64GB or larger based on sizing analysis. In the <b>Resource Allocation</b> panel, ensure that <b>Reserve all guest memory</b> is checked. To adjust the resource allocation of a VM without rebooting it, Delphix supports "hot-plugging" CPUs and memory to ZFS. Please note that this is only available on ESX. For more information, refer to the Enabling hot-adding section on this page.
Number of CPUs	Allocate 8 vCPUs or more based on Delphix licensing. vCPUs should be fully reserved to ensure that the Delphix Engine does not compete for CPU cycles on an overcommitted host.
Supported Controllers	Delphix supports Paravirtual SCSI (PVSCSI) controllers or LSI Parallel controllers. A mix of different types of SCSI controllers is not supported within the engine.  It is recommended to use PVSCSI controllers by default. Although PVSCSI supports high throughput with minimal processing cost, the performance improvements on Delphix Engine may vary from case to case.
Disks for Data Storage	Add virtual disks to provide storage for user data such as dSources and VDBs. The underlying storage must be redundant. Add a minimum of 150GB per storage disk. All virtual disks should be the same size and have the same performance characteristics. If using VMFS, use thick provisioned, lazy zeroed disks. To alleviate IO bottlenecks at the virtual controller layer, spread the virtual disks across all four virtual SCSI controllers.

Setting	Options
Data Storage Multipathing Policy	<p>For EMC storage, the multipathing policy should always be set to round-robin (default for 5.x). Additionally, change the IO Operation Limit from the default of 1000 to 1. This should be strongly considered for other storage platforms as well.</p> <p>See VMware KB article <a href="#">EMC VMAX and DMX symmetrix storage array recommendations for optimal performance on VMware ESXi/ESX</a>.</p>
Network	<p>The network configuration is set to have a VMXNET3 network adapter. VMXNET3 is a tuned network interface that is included with the VMtools provided in the OVA file. It will be assigned to VM Network.</p> <p><b>JUMBO Frames</b> VMXNET3 supports Ethernet jumbo frames, this can be used to maximize throughput and minimize CPU utilization.</p> <p><b>Adding Link Aggregation via VMware NIC Teaming</b> To increase throughput or for failover, add multiple physical NICs to the vSwitch that is connected to the Delphix Engine. To increase throughput, NIC Teaming must use the Route Based on IP Hash protocol for load balancing.</p> <p><b>Dedicate Physical NICs to the Delphix Engine</b> For best performance, assign the Delphix Engine to network adapters that are used exclusively by Delphix.</p>

## Enabling hot-adding

To manually enable hot-adding in the VCenter console, use the following steps.

1. Select the Delphix Engine.
2. Right-click on the engine and select **Edit settings**.
3. Edit settings:
  - a. To enable CPU hot-add, navigate to the CPU section and select the **CPU Hot Plug** checkbox.
  - b. To enable memory hot-add, navigate to the memory section and select the **Memory Hot Plug** checkbox.
4. Modify the appropriate setting to the new value; note that only expansion of CPU and memory is supported, and attempts to reduce the values available to the Delphix Engine will fail.
5. Click **OK** to confirm the changes.

Newly-added memory is not automatically reflected in system information APIs nor in the UI. Restarting the management service is needed to refresh this information.

For customers migrating from versions before 6.0, an extra step is required to enable CPU/memory hot-plug.

1. After migrating, turn off the VM.
2. Open **VM Settings**.

3. Select **VM Options**.
4. Under **General**, update the guest OS to Ubuntu (64-bit).
5. Under **Advanced**, select **Edit Configuration**.
6. Set **disk.EnableUUID** to TRUE.
7. Follow normal hot-plug enable steps.

 For customers that are upgrading their existing engines from versions below 6.0.6.0, two vSphere properties need to be enabled manually after the upgrade from vSphere in order to use this feature. The properties are **cpuidHotAddEnabled** and **memoryHotAddEnabled**. When upgrading to 6.0 from 5.3, the guest OS and version in vSphere also needs to be updated to Ubuntu, in addition to the above two properties. Without this, it has been noticed that hot-adding memory is not allowed from vSphere, even if memoryHotAddEnabled is enabled.

### Post-requisites

- After making any changes to the system settings, power on the Delphix Engine again and proceed with the initial system configuration as described in [Setting up network access to the Delphix engine](#).

## Installing an OVA or AMI

### Overview

This article outlines how to install the Delphix Engine using an OVA or AMI file.

### Procedure to install an OVA

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

1. Download the OVA file from <https://download.delphix.com>. A support login is needed from the Delphix representative or welcome letter.
  - a. Navigate to the Delphix Product Releases/<Current Version>/Appliance Images page.
2. Login using the vSphere client to the vSphere server (or vCenter Server) where the Delphix Engine will be installed.
3. In the vSphere Client, click **File**.
4. Select **Deploy OVA Template**.
5. Browse to the OVA file.
6. Click **Next**.
7. Select a **hostname** for the Delphix Engine. This hostname will also be used in configuring the Delphix Engine network.
8. Select the **data center** where the Delphix Engine will be located.
9. Select the **cluster** and the **ESX host**.
10. Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
11. Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
12. Select the **virtual network** to be used. If using multiple physical NICs for link aggregation, vSphere NIC teaming must be used. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal Network Architecture for the Delphix Engine](#).
13. Click **Finish**. The installation will begin and the Delphix Engine will be created in the location specified.
14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting Up Network Access to the Delphix Engine](#).

### Procedure to install an AMI

Use the Delphix-supplied AMI file to install the Delphix Engine.

1. On the Delphix download site, click the AMI to be shared and accept the Delphix License agreement. Alternatively, follow a link given by the Delphix solutions architect.
2. On the **Amazon Web Services Account Details** form presented:
  - a. Enter the **AWS Account Identifier**, which can be found here: <https://console.aws.amazon.com/billing/home?#/account>. To use the **Gov Cloud AWS Region**, be sure to enter the ID for the AWS Account which has Gov Cloud enabled.
  - b. Select which **AWS Region** the AMI should be shared in. To have the AMI shared in a different region, contact the Delphix account representative for the proper arrangements.
3. Click **Share**. The Delphix Engine will appear in the list of AMIs in AWS momentarily.

# Validating host deployment with host Checker

## Overview

Delphix has developed a hostchecker script that contains standardized checks for source and target hosts - these checks generally fall into three buckets:

- OS and Host permissions/access
- Network Port Checks
- DB-specific functionality

OS and Host permissions/access and network port checks can (and should) be performed prior to Delphix installation to ensure a smooth deployment.

Each DB should have a specifically associated hostchecker, there is detailed documentation on the DB-specific hostchecker page.

## Procedure

1. Download the appropriate **HostChecker tarball** for the engine from <https://download.delphix.com/>. Tarballs follow the naming convention "hostchecker\_<OS>\_<processor>.tar". For example, if validating a linux x86 host, download the hostchecker\_linux\_x86.tar tarball.
2. Create a working directory and extract the **HostChecker files** from the **HostChecker tarball**

```
mkdir dlp-host-checker
cd dlp-host-checker/
tar -xf hostchecker_linux_x86.tar
```

3. Run the `sh` script contained within:

```
sh hostchecker.sh
```

This will extract the JDK included in the tarball (if necessary) and invoke the HostChecker.

```
ora10205@bbdhcp: /home/ora10205/hostchecker- > sh hostchecker.sh
Extracting the JDK from the tarball jdk-6u45-linux-i586.tar.gz.
```

Do not run the HostChecker as root; this will cause misleading or incorrect results from many of the checks.

4. Select which **checks** to run. Note that it is possible to run checks without spawning the interface. Enter `--help` to get a list of arguments that can pass to the HostChecker.
5. As the checks are made, enter the requested **arguments**.
6. Read the output of the check. The general format is that severity increases farther down the output. First comes informational output, then warnings, then errors. If you see a message that starts with `Internal Error`, forward it to Delphix Support immediately. This represents a potential bug in the HostChecker, and not necessarily a problem with your environment.
7. Error or warning messages will explain any possible problems and how to address them. Resolve the issues that the HostChecker describes. Do not be surprised or undo your work if more errors appear the next time you run HostChecker, because the error you just fixed may have been masking other problems.
8. Repeat steps 3 - 7 until all the checks return no errors or warnings.

## Deployment for VMware

### Overview

This article outlines the requirements for deploying the Delphix Engine on VMware (including supported versions and instance configurations), as well as recommended configuration parameters for optimal performance.

The Delphix Engine is an intensive platform, both from a network and a storage perspective. If the Delphix Engine competes with other virtual machines on the same host for resources it will result in increased latency for all operations. As such, it is crucial that the ESXi host is not over-subscribed, as this eliminates the possibility of a lack of resources for the Delphix Engine. This includes allowing a percentage of CPU resources for the hypervisor itself as it can de-schedule an entire VM if the hypervisor is needed for managing IO or compute resources.

### Supported ESX versions

Requirements	Notes
<ul style="list-style-type: none"> <li>VMware Cloud</li> <li>VMware ESXi 8.0</li> <li>VMware ESXi 7.0, 7.0 U1, 7.0 U2, 7.0 U3c</li> <li>VMware ESXi 6.7 U3</li> <li>VMware ESXi 6.5 U1, 6.5 U3</li> <li>VMware ESX/ESXi 6.0</li> </ul>	<ul style="list-style-type: none"> <li>More recent versions of VMware are preferred, such as ESX/ESXi 6.0 - 7.0 U3c</li> </ul>

If a minor release version is listed as supported, then all patch releases applicable to that minor release are certified.

### Virtual CPUs

Requirements	Notes
8 vCPUs	<ul style="list-style-type: none"> <li>CPU resource shortfalls can occur both on an over-committed host as well as competition for host resources during high IO utilization.</li> <li>CPU reservations are <b>strongly recommended</b> for the Delphix VM so that Delphix is guaranteed the full complement of vCPUs even when resources are overcommitted.</li> <li>It is suggested to use a single core per socket unless there are specific requirements for other VMs on the same ESXi host.</li> </ul>
Never allocate all available physical CPUs to virtual machines	<ul style="list-style-type: none"> <li>CPU for the ESXi Server to perform hypervisor activities must be set aside before assigning vCPUs to Delphix and other VMs.</li> <li>We recommend that a minimum of 8-10% of the CPUs available are reserved for hypervisor operation. (e.g. 12 vCPUs on a 128 vCore system).</li> </ul>

## Memory

Requirements	Notes
<p>128 GB vRAM (recommended)</p> <p>64GB vRAM (minimum)</p>	<ul style="list-style-type: none"> <li>The Delphix Engine uses its memory to cache database blocks. More memory will provide better read performance.</li> <li>Memory reservations are <b>required</b> for the Delphix VM. The performance of the Delphix Engine will be significantly impacted by the over-commitment of memory resources in the ESX Server.</li> <li>Reservations ensure that the Delphix Engine will not be forced to swap pages during times of memory pressure on the host. A swapped page will require orders of magnitude more time to be brought back to physical memory from the ESXi swap device.</li> </ul>
<p>Never allocate all the available physical memory to virtual machines.</p>	<ul style="list-style-type: none"> <li>The default ESX minimum free memory requirement is 6% of the total RAM. When free memory falls below 6%, ESX starts swapping out the Delphix guest OS. Delphix recommends leaving about 8-10% free to avoid swapping.</li> <li>For example, when running on an ESX Host with 512GB of physical memory, no more than 470GB (92%) should be allocated to the Delphix VM (and all other VMs on that host).</li> </ul>
<p>Memory for the ESX Server to perform hypervisor activities must be set aside before assigning memory to Delphix and other VMs.</p>	<p>Failure to ensure sufficient memory for the host can result in a hard memory state for all VMs on the host which will result in a block for memory allocations.</p>

## Network

Requirements	Notes
<p>The ova is pre-configured to use one virtual ethernet adapter of type VMXNET 3.</p>	<ul style="list-style-type: none"> <li>Jumbo frames are highly recommended to reduce CPU utilization, decrease latency and increase network throughput. (typically 10-20% throughput improvement)</li> <li>If additional virtual network adapters are desired, they should also be of type VMXNET 3.</li> </ul>
<p>A 10GbE NIC in the ESX Server is recommended.</p>	<ul style="list-style-type: none"> <li>For VMs having only gigabit networks, it is possible to aggregate several physical 1GbE NICs together to increase network bandwidth (but not necessarily to reduce latency). Refer to the VMware Knowledge Base article <a href="#">NIC Teaming in ESXi and ESX</a>. However, it is not recommended to aggregate NICs in the Delphix Engine VM.</li> </ul>

Requirements	Notes
If the network load in the ESX Server hosting the Delphix engine VM is high, dedicate one or more physical NICs to the Delphix Engine.	<ul style="list-style-type: none"> <li>• Adding NICs only works if VMs are discovered using different interfaces. The NFS/iSCSI mounts will only use the network associated with the discovery.</li> <li>• See <a href="#">General Network and Connectivity Requirements</a> for information about specific port configurations, and <a href="#">Network Performance Configuration Options</a> for information about network performance tuning</li> </ul>

To bootstrap a networking configuration to reach the Delphix Engine, after deploying it into your environment for the first time, you can use one of the following options:

- DHCP
- Cloud-init for public clouds
- You can login to the serial console to configure networking via the CLI
- [OVF guest customizations](#) to pass in network configuration to the VM before it has a network connection. For the customization steps:
  - Type the name of the profile and click **Next**
  - The domain will be ignored by Delphix. Click **Next**
  - The time zone setting will be ignored by Delphix, Click **Next**
  - Delphix doesn't allow scripts, click **Next**
  - Manually select custom settings, select a **NIC** and click **Edit**
    - Provide **Netmask** and **Gateway**
    - Select one of the options for IP
    - Confirm changes and click **Next**
  - Add **DNS**
  - Confirm creation of profile, click **Finish**
  - You can use this template to clone a VM

## SCSI controller

Requirements	Notes
PVSCSI (default)/ LSI Logic Parallel	<p>When adding virtual disks make sure that they are evenly distributing the load across the maximum of 4 virtual SCSI controllers. Spreading the disks across available SCSI controllers evenly will ensure optimal IO performance from the disks. For example, a VM with 4 SCSI controllers and 8 virtual disks should distribute the disks across the controllers as follows:</p> <p>disk0 = SCSI(0:0) - System Disk on Controller 0 Port 0                      (ignore for purposes of load balancing)</p> <p>disk1 = SCSI(0:1) - Data Disk on Controller 0 Port 1                      disk2 = SCSI(1:1) - Data Disk on Controller 1 Port 1                      disk3 = SCSI(2:1) - Data Disk on Controller 2 Port 1                      disk4 = SCSI(3:1) - Data Disk on Controller 3 Port 1</p> <p>disk1 = SCSI(0:2) - Data Disk on Controller 0 Port 2                      disk2 = SCSI(1:2) - Data Disk on Controller 1 Port 2                      disk3 = SCSI(2:2) - Data Disk on Controller 2 Port 2                      disk4 = SCSI(3:2) - Data Disk on Controller 3 Port 2</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p><span style="font-size: 1.2em;">i</span> For load purposes, we generally focus on the DB storage and ignore the controller placement of the system disk.</p> </div>

## General storage

i VMware offers options for disk storage, which include "Independent - Persistent" and "Independent - Non-persistent". The non-persistent setting is catastrophic to the Delphix platform when the VM reboots, thus, **Independent - Persistent** is required for installation.

Requirements	Notes
Storage used for Delphix must be provisioned from storage that provides data protection.	<p>For example, using RAID levels with data protection features, or equivalent technology. The Delphix engine product does not protect against data loss originating at the hypervisor or SAN layers.</p> <p>For more information refer to, <a href="#">Optimal Storage Configuration Parameters for the Delphix Engine</a>.</p>

## Delphix storage options

There are three types of data that Delphix stores on disk, which is:

1. **Delphix VM Configuration Storage:** stores data related to the configuration of the Delphix VM. VM Configuration Storage includes the VMware ESX configuration data as well as log files.
2. **Delphix Engine System Disk Storage:** stores data related to the Delphix Engine system data, such as the Delphix .ova settings.
3. **Database Storage:** stores data used by Delphix objects such as dSources and virtual databases (VDBs).

### Delphix VM configuration storage

The Delphix VM configuration should be stored in a VMFS volume (often called a "datastore").

Requirements	Notes
The VMFS volume should have enough available space to hold all ESX configuration and log files associated with the Delphix Engine.	If a memory reservation is not enabled for the Delphix Engine (in violation of memory requirements stated above), then space for a paging area equal to the Delphix Engine's VM memory must be added to the VMFS volume containing the Delphix VM configuration data.

### Delphix engine system disk storage

The VMFS volume must be located on shared storage in order to use vMotion and HA features.

Requirements	Notes
The Delphix Engine system disk should be stored in a VMDK.	<ul style="list-style-type: none"> <li>• The VMDK for the Delphix Engine System Disk Storage is often created in the same VMFS volume as the Delphix VM definition. In that case, the datastore must have sufficient space to hold the Delphix VM Configuration, the VMDK for the system disk, and a paging area if a memory reservation was not enabled for the Delphix Engine.</li> </ul>
The Delphix .ova file is configured for a 127GB system drive.	<ul style="list-style-type: none"> <li>• The VMFS volume where the .ova is deployed should, therefore, have at least 127GB of free space prior to deploying the .ova.</li> </ul>

### Database storage

Shared storage is required in order to use vMotion and HA features. In addition to making sure the latest VMware patches have been applied, check with the organizations hardware vendor for updates specific to the hardware configurations. VMDKs (Virtual Machine Disks) or RDMs (Raw Device Mappings) operating in virtual compatibility mode can be used for database storage.

Requirements	Notes
A minimum of 4 VMDKs or RDMs should be allocated for database storage.	<ul style="list-style-type: none"> <li>Allocating a minimum of 4 VMDKs or RDMs for database storage enables the Delphix File System (DxFS) to make sure that its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.</li> </ul>
<p>If using VMDKs:</p> <ul style="list-style-type: none"> <li>Each VMDK should be the only VMDK in its VMFS volume</li> <li>The VMFS volumes should be assigned to dedicated physical LUNs on redundant storage.</li> <li>The VMDKs should be created with the Thick Provision Lazy Zeroed option.</li> </ul>	<ul style="list-style-type: none"> <li>Provisioning VMDKs from isolated VMFS volumes on dedicated physical LUNs: <ul style="list-style-type: none"> <li>Reduces contention for the underlying physical LUNs</li> <li>Eliminates contention for locks on the VMFS volumes from other VMs and/or the ESX Server Console</li> <li>Enables higher availability of the Delphix VM by allowing vSphere to vMotion the VM to a different ESX host in the event of a failure of the Delphix ESX host</li> </ul> </li> </ul>
The quantity and size of VMDKs or RDMs assigned must be identical across all 4 controllers	<ul style="list-style-type: none"> <li>If the underlying storage array allocates physical LUNs by carving them from RAID groups, the LUNs should be allocated from different RAID groups. This eliminates contention for the underlying disks in the RAID groups as the Delphix engine distributes IO across its storage devices.</li> </ul>
The physical LUNs used for VMFS volumes and RDMs should be of the same type in terms of performance characteristics such as latency, RPMs, and RAID level.	<ul style="list-style-type: none"> <li>The total number of disk drives that comprise the set of physical LUNs should be capable of providing the desired aggregate I/O throughput (MB/sec) and IOPS (Input/Output Operations per Second) for all virtual databases that will be hosted by the Delphix Engine.</li> </ul>
The physical LUNs used for VMFS volumes can be thin-provisioned in the storage array.	<ul style="list-style-type: none"> <li>If the storage array allocates physical LUNs from storage pools comprising dozens of disk drives, the LUNs should be distributed evenly across the available pools.</li> </ul>

Requirements	Notes
<p>For best performance, the LUNs used for RDMs should not be thin-provisioned in the storage array but should be thick-provisioned with a size equal to the amount of storage that will be initially allocated to the Delphix Engine. The RDM can be expanded in the future when more storage is needed.</p>	<ul style="list-style-type: none"> <li>Using thin-provisioned LUNs in the storage array for VMFS volumes can be useful if adding storage to the Delphix engine in the future is anticipated. In this case, the LUNs should be thin-provisioned with a size larger than the amount of storage that will be initially allocated to the Delphix Engine. When appropriate, to add more storage to the Delphix engine, use vSphere to expand the size of the VMDKs. Be sure to specify that the additional storage is also thick-provisioned and eager-zeroed.</li> </ul>

In addition to making sure the latest VMware patches have been applied, check with the organization's hardware vendor for updates specific to the hardware configurations.

## Additional VMware configuration notes

- Running Delphix inside of vSphere is supported.
- Using vMotion on a Delphix VM is supported.
- Device passthrough is not supported.

## Procedure to install an OVA

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

- Download the OVA file from <https://download.delphix.com>. You will need a support login from your sales team or a welcome letter.
  - Navigate to the Delphix Product Releases/<Current Version>/Appliance Images page.
- Login using the vSphere client to the vSphere server (or vCenter Server) where you want to install the Delphix Engine.
- In the vSphere Client, click **File**.
- Select **Deploy OVA Template**.
- Browse to the OVA file.
- Click **Next**.
- Select a **hostname** for the Delphix Engine.  
This hostname will also be used in configuring the Delphix Engine network.
- Select the **data center** where the Delphix Engine will be located.
- Select the **cluster** and the **ESX host**.
- Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
- Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
- Select the **virtual network** you want to use.  
If using multiple physical NICs for link aggregation, you must use vSphere NIC teaming. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal network architecture for the Delphix engine](#).

13. Click **Finish**.  
The installation will begin and the Delphix Engine will be created in the location you specified.
14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting up network access to the Delphix engine](#)

# Deployment for KVM

## Overview

This article outlines the requirements for deploying the Delphix Engine via Linux KVM, as well as recommended configuration parameters.

Contact a Delphix representative to request this capability. Delphix will assist in assuring that all KVM requirements are met to successfully run a Delphix Engine with the most appropriate configurations for the use case.

The Delphix Engine is intensive from both a network and storage perspective. If the Delphix Engine competes with other virtual machines on the same host for resources it will result in increased latency for all operations. As such, it is crucial that your KVM host is not over-subscribed, as this eliminates the possibility of a lack of resources for the Delphix Engine. This includes allowing a percentage of CPU resources for the hypervisor itself as it can de-schedule an entire VM if the hypervisor is needed for managing I/O or compute resources.

The KVM ecosystem includes many versions/variations. Delphix is announcing general support for KVM, but will forgo any formal certification for specific versions and rather will focus on declared support for specific Linux Kernels.

## Pre-requisites

### **1. The KVM provider must explicitly state that the Ubuntu 18.04/20.04 kernel is supported by their variation of KVM.**

Most, if not all, KVM hypervisor providers should have public facing documentation which include support matrices for guest OS compatibility. If the KVM hypervisor provider does not explicitly state support for the Ubuntu kernel versions used in the supported Linux Delphix versions (either 18.04 currently, or 20.04 in the future), Delphix cannot support the KVM provider.

As an example, RedHat Linux (a KVM hypervisor provider), provides a publicly accessible [guest operating system support matrix](#). As of December 2021, this matrix does not include support for any Ubuntu guest OS, and therefore Delphix would also not support deployment on RedHat Linux KVM. Oracle Linux (a different KVM hypervisor provider) also provides a publicly accessible [guest operating system support matrix](#), which declares support for Ubuntu 16.04, 18.04, and 20.04. In this case, since the hypervisor provider declares support for the Delphix Ubuntu kernel(s), Delphix will support deployment on Oracle Linux KVM.

### **2. A check of the Delphix appliance on the variation/version of KVM.**

It is **required** that a Delphix representative works with the organization to check the Delphix appliance (and/or use case) on the specified KVM variation/version. This check will ensure that the software is compatible.

## Virtual CPUs

Requirements	Notes
8 vCPUs	<ul style="list-style-type: none"> <li>• CPU resource shortfalls can occur on an over-committed host as well as competition for host resources during high IO utilization.</li> <li>• CPU reservations are strongly recommended for the Delphix VM so that Delphix is guaranteed the full complement of CPUs even when resources are overcommitted.</li> <li>• It is suggested to use a single core per socket unless there are specific requirements for other VMs on the same KVM host.</li> </ul>
Never allocate all available physical CPUs to virtual machines.	<ul style="list-style-type: none"> <li>• A CPU for the KVM Server to perform hypervisor activities must be set aside before assigning vCPUs to Delphix and other VMs.</li> <li>• We recommend that a minimum of 8-10% of the CPUs available are reserved for hypervisor operation. (e.g. 12 vCPUs on a 128 vCore system).</li> </ul>

## Memory

Requirements	Notes
128 GB vRAM (recommended) 64 GB vRAM (minimum)	<ul style="list-style-type: none"> <li>• The Delphix Engine uses its memory to cache database blocks. More memory will provide better read performance.</li> <li>• Memory reservations are required for the Delphix VM. The performance of the Delphix Engine will be significantly impacted by the over-commitment of memory resources in the KVM Server.</li> <li>• Reservations ensure that the Delphix Engine will not be forced to swap pages during times of memory pressure on the host. A swapped page will require orders of magnitude more time to be brought back to physical memory from the KVM swap device.</li> </ul>
Memory for the KVM Server to perform hypervisor activities must be set aside before assigning memory to Delphix and other VMs.	<ul style="list-style-type: none"> <li>• Failure to ensure sufficient memory for the host can result in a hard memory state for all VMs on the host which will result in a block for memory allocations.</li> </ul>

## Network

Requirements	Notes
Virtual ethernet adapter requirements.	<ul style="list-style-type: none"> <li>Jumbo frames are highly recommended to reduce CPU utilization, decrease latency, and increase network throughput (typically 10-20% throughput improvement).</li> <li>A 10GbE NIC/network is recommended for performance dSource and VDB operations.</li> </ul>
If the network load in the KVM Server hosting the Delphix engine VM is high, dedicate one or more physical NICs to the Delphix Engine.	<ul style="list-style-type: none"> <li>Adding NICs only works if VMs are discovered using different interfaces. The NFS/iSCSI mounts will only use the network associated with the discovery.</li> <li>See <a href="#">General Network and Connectivity Requirements</a> for information about specific port configurations, and <a href="#">Network Performance Configuration Options</a> for information about network performance tuning.</li> </ul>

## SCSI controller

Notes
When adding virtual disks, make sure that they are evenly distributing the load across the maximum of 4 virtual SCSI controllers. Spreading the disks across available SCSI controllers evenly will ensure optimal IO performance from the disks. For example, a VM with 4 SCSI controllers and 8 virtual disks should distribute the disks across the controllers as follows:
disk0 = SCSI(0:0) - System Disk on Controller 0 Port 0 (ignore for purposes of load balancing)
disk1 = SCSI(0:1) - Data Disk on Controller 0 Port 1
disk2 = SCSI(1:1) - Data Disk on Controller 1 Port 1
disk3 = SCSI(2:1) - Data Disk on Controller 2 Port 1
disk4 = SCSI(3:1) - Data Disk on Controller 3 Port 1
disk5 = SCSI(0:2) - Data Disk on Controller 0 Port 2
disk6 = SCSI(1:2) - Data Disk on Controller 1 Port 2
disk7 = SCSI(2:2) - Data Disk on Controller 2 Port 2

Notes
disk8 = SCSI(3:2) - Data Disk on Controller 3 Port 2
<p>For load purposes, we generally focus on the DB storage and ignore the controller placement of the system disk.</p>

## General storage

Delphix recommends using a minimum of four disks to run your Delphix Engine. One disk is used for the Delphix File System (DxFS) to ensure that its file systems are always consistent on disk without additional serialization. The other three or more equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

Requirements	Notes
Storage used for Delphix must be provisioned from storage that provides data protection.	<p>For example, using RAID levels with data protection features, or equivalent technology.</p> <p>The Delphix Engine does not protect against data loss originating at the hypervisor or SAN layers.</p> <p>For more information refer to, <a href="#">Optimal storage configuration parameters for the Delphix engine</a>.</p>

## Deployment for Hyper-V

### Overview

This article outlines the requirements for deploying the Delphix Engine on Hyper-V (including supported versions and instance configurations), as well as recommended configuration parameters for optimal performance.

Contact a Delphix representative to request this capability. Delphix will assist in assuring that all Hyper-V requirements are met to successfully run a Delphix Engine with the most appropriate configuration for the use case.

The Delphix Engine is intensive both from a network and a storage perspective. If the Delphix Engine competes with other virtual machines on the same host for resources it will result in increased latency for all operations. As such, it is crucial that your Hyper-V host is not over-subscribed, as this eliminates the possibility of a lack of resources for the Delphix Engine. This includes allowing a percentage of CPU resources for the hypervisor itself as it can de-schedule an entire VM if the hypervisor is needed for managing I/O or compute resources.

### Supported versions

- Hyper-V Version: 10.0 and later
- Virtual Machine: Gen 1 only is supported

### Virtual CPUs

Requirements	Notes
8 vCPUs	<ul style="list-style-type: none"> <li>• CPU resource shortfalls can occur on an Over-committed host as well as competition for host resources during high IO utilization.</li> <li>• CPU reservations are strongly recommended for the Delphix VM so that Delphix is guaranteed the full complement of CPUs even when resources are overcommitted.</li> <li>• It is suggested to use a single core per socket unless there are specific requirements for other VMs on the same Hyper-V host.</li> </ul>
Never allocate all available physical CPUs to virtual machines.	<ul style="list-style-type: none"> <li>• CPU for the Hyper-V Server to perform hypervisor activities must be set aside before assigning vCPUs to Delphix and other VMs</li> <li>• We recommend that a minimum of 8-10% of the CPUs available are reserved for hypervisor operation. (e.g. 12 vCPUs on a 128 vCore system).</li> </ul>

## Memory

Requirements	Notes
<p>128 GB vRAM (recommended)</p> <p>64GB vRAM (minimum)</p>	<ul style="list-style-type: none"> <li>• The Delphix Engine uses its memory to cache database blocks. More memory will provide better read performance.</li> <li>• Memory reservations are required for the Delphix VM. The performance of the Delphix Engine will be significantly impacted by the over-commitment of memory resources in the Hyper-V Server.</li> <li>• Reservations ensure that the Delphix Engine will not be forced to swap pages during times of memory pressure on the host. A swapped page will require orders of magnitude more time to be brought back to physical memory from the Hyper-V swap device.</li> </ul>
<p>Memory for the Hyper-V Server to perform hypervisor activities must be set aside before assigning memory to Delphix and other VMs.</p>	<p>Failure to ensure sufficient memory for the host can result in a hard memory state for all VMs on the host which will result in a block for memory allocations.</p>

## Network

Requirements	Notes
<p>Virtual ethernet adapter requirements.</p>	<ul style="list-style-type: none"> <li>• SR-IOV is recommended for all virtual ethernet adapters that will be used for Delphix data I/O.</li> <li>• Jumbo frames are recommended.</li> <li>• A 10GbE NIC in the Hyper-V Server is recommended.</li> </ul>
<p>If the network load in the Hyper-V Server hosting the Delphix engine VM is high, dedicate one or more physical NICs to the Delphix Engine.</p>	<ul style="list-style-type: none"> <li>• Adding NICs only works if VMs are discovered using different interfaces. The NFS/iSCSI mounts will only use the network associated with the discovery.</li> <li>• See <a href="#">General network and connectivity requirements</a> for information about specific port configurations, and <a href="#">Network performance configuration options</a> for information about network performance tuning.</li> </ul>

## SCSI controller

Requirements	Notes
IDE Controller for the boot drive SCSI Controller for database storage	<p>Per <a href="#">Hyper-V Storage I/O Performance Tuning Guidelines</a>; For optimal performance, it is recommended that you attach multiple disks to a single virtual SCSI controller and create additional controllers only as they are required to scale the number of disks connected to the virtual machine.</p> <p>For example, a VM with 3 virtual disks should distribute the disks across the single SCSI controller as follows:</p> <ul style="list-style-type: none"> <li>• IDE Controller 1               <ul style="list-style-type: none"> <li>• Boot Drive</li> </ul> </li> <li>• SCSI Controller               <ul style="list-style-type: none"> <li>• disk1</li> <li>• disk2</li> <li>• disk3</li> </ul> </li> </ul> <div style="background-color: #e6e6ff; padding: 10px; margin-top: 10px;"> <p> For load purposes, we generally focus on the DB storage and ignore the controller placement of the system disk.</p> </div>

## General storage

Delphix recommends using a minimum of four disks to run your Delphix Engine. One disk is used for the Delphix File System (DxFS) to ensure that its file systems are always consistent on disk without additional serialization. The other three or more equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

Requirements	Notes
Storage used for Delphix must be provisioned from storage that provides data protection.	<p>For example, using RAID levels with data protection features, or equivalent technology.</p> <p>The Delphix Engine does not protect against data loss originating at the hypervisor or SAN layers.</p> <p>For more information refer to, <a href="#">Optimal storage configuration parameters for the Delphix engine</a>.</p>

## Delphix storage options

There are two types of data that Delphix stores on disk which must be stored on NTFS volumes:

1. Delphix Engine System Disk Storage: This is the system boot drive.
2. Database Storage: stores data used by Delphix objects such as dSources and virtual databases (VDBs).

## Delphix engine system disk storage

Requirements	Notes
The Delphix Engine disks must be stored on NTFS volume(s).	The volume for the Delphix Engine System Disk Storage is often created on the same volume as the Delphix VM definition. In that case, the volume must have sufficient space to hold the Delphix VM Configuration, the virtual disk for the system disk, and a paging area if a memory reservation was not enabled for the Delphix Engine.
The Delphix .vhdx file is configured for a 128GB system drive.	The volume where the .vhdx is deployed should, therefore, have at least 127GB of free space prior to deploying the .vhdx.

## Database storage

In addition to making sure the latest Hyper-V patches have been applied, check with your hardware vendor for updates specific to your hardware configuration. VHDXs (virtual machine disks).

Requirements	Notes
A minimum of 3 VHDXs should be allocated for database storage.	Allocating a minimum of 3 VHDXs for database storage enables the Delphix File System (DxFS) to make sure that its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queuing more I/O operations to its storage.
If using VHDXs: <ul style="list-style-type: none"> <li>Each VHDX should be the only VHDX on its NTFS volume</li> <li>The VHDX volumes should be assigned to dedicated physical LUNs on redundant storage.</li> </ul>	Provisioning VHDXs from isolated volumes on dedicated physical LUNs: <ul style="list-style-type: none"> <li>Reduces contention for the underlying physical LUNs</li> <li>Eliminates contention for locks on the volumes from other VMs and/or the Hyper-V Server Console</li> </ul>
	If the underlying storage array allocates physical LUNs by carving them from RAID groups, the LUNs should be allocated from different RAID groups. This eliminates contention for the underlying disks in the RAID groups as the Delphix engine distributes IO across its storage devices.

<b>Requirements</b>	<b>Notes</b>
The physical LUNs used for NTFS volumes should be of the same type in terms of performance characteristics such as latency, RPMs, and RAID levels.	The total number of disk drives that comprise the set of physical LUNs should be capable of providing the desired aggregate I/O throughput (MB/sec) and IOPs (Input/Output Operations per Second) for all virtual databases that will be hosted by the Delphix Engine
Disk types supported by the physical LUNs used for NTFS volumes are: Fixed-size and Dynamically expanding.	If the storage array allocates physical LUNs from storage pools comprising dozens of disk drives, the LUNs should be distributed evenly across the available pools.

## Procedure for deploying with Hyper-V

### Overview

This article outlines the procedure for deploying the Delphix Engine in Hyper-V.

### Creating a Delphix engine VM

1. Download the image from <https://download.delphix.com> and copy it to a VM directory.
2. Start the Hyper-V Manager and specify **Name** and **Location**, then select **Next**.
3. Select **Generation 1**, configure memory and then select **Next**.  
**Memory:** 64 GB (minimum), 128 GB (recommended)
4. Set up Networking by selecting **vNIC**, then select **Next**.
5. Attach the downloaded image as a boot disk. Create a unique boot disk for each image. Please note that boot disks cannot be shared.
  - a. Use an existing virtual hard disk.
  - b. Browse to the location of VM.
  - c. Select the Image.
6. Select **Finish**, the VM will appear in the inventory.

### Customize the VM by selecting **settings**

1. Delphix recommends having the IDE as the first device to boot from (under BIOS setting).
2. Adjust the number of CPUs (min 8).
3. Add a minimum of four equal-sized **Hard Drives** for the database storage. Use VHDX formatted disks. Recommend Fixed Size disk type. Please note that Differencing Disk Types are not supported.
4. Connect to the console and start the VM.
5. Once the installation has been completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting up network access to the Delphix engine](#).

## Deployment for AWS EC2

### Overview

This article outlines the virtual machine requirements, including memory and data storage, for deploying the Delphix Engine on Amazon EC2 (Elastic Cloud Compute). Once the requirements listed on this page are reviewed, refer to the next articles in the AWS EC2 Deployment topic:

- [Prerequisites to Deploying in AWS](#)
- [Procedure for Deploying in AWS](#)

### Instance types

The following is a list of instance types that are supported to deploy Delphix on AWS EC2. Delphix periodically certifies new instance types, which will be added to the list here.

Requirements	Notes
<p>Memory Optimized Instances:</p> <ul style="list-style-type: none"> <li>• <b>R4</b></li> <li>• <b>R5n</b></li> <li>• <b>R5b</b></li> <li>• <b>R6in</b></li> <li>• <b>R6idn</b></li> </ul> <p>This includes all instance sizes having at least 8 vCPU and 64 GiB of memory within the instance types listed above.</p>	<ul style="list-style-type: none"> <li>• Larger instance types provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions.</li> <li>• Larger instances also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance.</li> <li>• Delphix Cloud Engines (Engines backed by s3 storage) will need more bandwidth than traditional engines (backed by EBS) because the s3 bucket used to store data is accessed over a network pipe that is shared with other engines activity.</li> </ul>

### Network configuration

It is recommended to enable Enhanced Networking to maximize performance. For more information view [Enhanced Networking on Linux](#). Note that the enhanced networking driver is included with Delphix software, and no steps need to be taken on the Delphix Engine to enable the feature other than rebooting.

Requirements	Notes
Virtual Private Cloud	<p>The Delphix Engine and all of the source and target environments must be deployed in a VPC network to ensure that private IP addresses are static and do not change when restarting instances.</p> <p>When adding environments to the Delphix Engine, use the host's VPC (static private) IP addresses.</p>

Requirements	Notes
Static Public IP	The EC2 Delphix instance must be launched with a static IP address; however, the default behavior for VPC instances is to launch with a dynamic public IP address – which can change whenever the instance restarts. If using a public IP address for the Delphix Engine, static IP addresses can only be achieved by using assigned <a href="#">AWS Elastic IP Addresses</a>
Security Group Configuration	<p>The default security group will only open port 22 for SSH access. The security group must be modified to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines.</p> <p>See <a href="#">Network Performance Configuration Options</a> for information about network performance tuning.</p> <p>See <a href="#">General Network and Connectivity Requirements</a> for information about specific port configurations.</p>

## EBS configuration

Deploying Delphix on AWS EC2 requires EBS volumes. Since EBS volumes are connected to EC2 instances via the network, other network activity on the instance can affect throughput to EBS volumes. Delphix recommends EBS General Purpose SSD (GP2 and GP3) or Provisioned IOPS SSD volumes to provide consistent and predictable storage performance. For more information on EBS volumes, see external documentation [href="https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-volume-types.html"](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-volume-types.html) >EBS Volume Types.

Recommendations	Notes
EBS Provisioned IOPS SSD Volumes (Highly Recommended)	<p>Delphix does not support the use of instance store volumes.</p> <p>Use EBS volumes with provisioned IOPs in order to provide consistent and predictable performance. The number of provisioned IOPs depends on the estimated IO workload on the Delphix Engine.</p> <p>Provisioned IOPs volumes must be configured with a volume size to provisioned IOPs per the <a href="#">EBS Volume Types</a> guidelines.</p>
EBS General Purpose SSD Volumes	<p>Delphix supports GP2 and GP3 General Purpose SSDs. You can now migrate your Amazon EBS volumes from GP2 to GP3. For more details on migration, see this <a href="#">Amazon documentation</a> on EBS Volumes Migration.</p> <p>Delphix Cloud Engines (Engines backed by s3 storage) need gp3 or higher.</p>

## General storage configuration

Requirements	Notes
General Storage Configuration	<p>For Delphix Cloud Engines (Engines backed by s3 storage), read the section <b>Delphix Cloud Engines (Engines backed by s3 storage)</b> in <a href="#">Initial Setup</a>.</p> <p>For Regular engines (backed by EBS):</p> <ul style="list-style-type: none"> <li>• Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %.</li> <li>• Add storage when storage capacity approaches 30% free.</li> <li>• All data storage volumes must be EBS volumes.</li> </ul> <p>Delphix recommends using a minimum of four equally sized storage disks to run the Delphix Engine. This allows the Delphix File System (DxFS) to assure its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.</p>

## Additional AWS configuration notes

- Using storage other than EBS is not supported.
- Limits on the number of volumes are dictated by the EBS instance type, and is generally advised that over 40 can be expected to cause issue on Linux VMs. More information can be found in the [AWS Volume Limits](#) and [AWS Volume Constraints](#) articles. The maximum device limit imposed by AWS can be handled by the Delphix Engine.
- Cold HDD (sc1) volumes (not supported due to poor performance)
- Using fast storage for EBS volumes is supported and recommended, including (in order of decreasing speed):
  - Provisioned IOPs SSD volumes (recommended)
  - General Purpose SSD volumes (supported)
  - Throughput Optimized HDD (supported, not recommended due to performance)
- Use of EBS volumes encrypted at creation is supported (during initial deployment from AMI, as well as storage devices added post-deployment), but can have negative performance consequences. Conversion of existing EBS volumes is possible in AWS but is not supported in Delphix at this time.

## Prerequisites to deploying in AWS

### Overview

This article outlines the prerequisites for deployment of the Delphix Engine on AWS. The setup user should have experience launching and configuring instances in the Amazon Web Services environment. Review and complete the tasks in the next section before deployment.

### Prerequisites

1. Review [Checklist of information required for installation and configuration](#).
2. Make sure that the Amazon account being used to deploy the Delphix Engine has an appropriate level of enablement to subscribe to the Delphix Engine for AWS subscription.
3. Determine which virtual private cloud (VPC) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet in which the virtual databases (VDBs) will be created.
  - a. Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.
4. Make sure that the necessary ports are open.
  - a. Using the Delphix Engine for AWS will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform:
    - i. [Network and connectivity requirements for oracle environments](#)
    - ii. [Network access requirements for SQL server environments](#)
    - iii. [Network and connectivity requirements for SAP ASE base environments](#)
    - iv. [Network and connectivity requirements for Db2 environments](#)
5. Update Security Group settings to accommodate the necessary connections.
  - a. Select the same Security Group that the current (or future) non-production EC2 compute nodes utilize.
  - b. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See links above for information about specific port configurations.
6. Allocate storage.
  - a. To properly size the initial storage capacity and determine the number and size of EBS Provisioned IOPs Volumes required, download and utilize the [Delphix-dynamic-data-platform-storage-calculator](#). It is helpful to first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).
  - b. All data storage volumes must be EBS volumes. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queuing more I/O operations to its storage.
  - c. Provisioned IOPs EBS volumes are highly recommended.
7. During the Manual Deployment option, use the guidelines outlined in [Virtual machine requirements for AWS EC2 platform](#).

## Geographic distribution in regions and availability zones

The latency will be directly related to not just the Availability Zone configuration, but more specifically the geographies of those zones. The latencies can vary from tens to hundreds of milliseconds if the zones are geographically diverse (US West to US East would certainly be expected to perform better than US West to Europe). AWS advertises that all AZs in a given region are interconnected with high-bandwidth and low-latency networking per [this AWS article](#).

Applications that are performance-sensitive will benefit from colocating the target servers and Engine in the same region if possible. Another possibility is building a failover strategy for those highly sensitive servers, enabling them to failover to another AZ in the instance where an Engine needs to be failed over. The architecture selected and geographies will also naturally be dependent on your redundancy requirements (your organization may require geographically diverse failover options beyond the ~60 miles advertised within a region).

## Procedure for deploying in AWS

### Overview

This article outlines the procedure for deploying the Delphix Engine on AWS, using the Delphix Marketplace Image or Amazon Machine Image (AMI).

### Procedure to install an AMI

Use the Delphix-supplied AMI file to install the Delphix Engine.

1. On the Delphix download site, select the AMI to be shared and accept the Delphix License agreement. Alternatively, use a link provided by the organization's Delphix solutions architect.
2. On the **Amazon Web Services Account Details** form presented:
  - a. Enter the [AWS Account Identifier](#). To use the **GovCloud AWS Region**, be sure to enter the ID for the AWS Account which has GovCloud enabled.
  - b. Select which **AWS Region** that the AMI will be shared in. For an AMI shared in a different region, contact the organization's Delphix account representative to make the proper arrangements.
3. Click **Share**. The Delphix Engine will appear in the list of AMIs in AWS momentarily.

### Subscribe to the Delphix virtualization engine marketplace image

1. Login to the AWS Console at <https://aws.amazon.com/console>.
2. Navigate to the AWS Marketplace.
3. In the **Search** field, enter **Delphix**.
4. Select the **Delphix DevOps Data Platform for AWS**. Select the appropriate offer based on the data you will ingest into the Delphix platform.
5. Review the information on the initial Marketplace page.
6. Click **Continue to Subscribe**.
7. Review the software subscription information and select the **Manual Launch** tab.
8. Select **Accept Software Terms**. Your subscription will take a few minutes to become enabled.
9. From the **Subscription** page, click **Return to Product Page**. There you will see **Launch with EC2 Console** enabled in all of the available regions.

### Launching the Delphix engine

1. In the desired region, select **Launch with EC2 Console**. Launching will redirect to the standard EC2 instance launch process.
2. Select the size of the virtual machine to deploy. For supported instance types and capabilities, see [Virtual machine requirements for AWS platform](#).
3. Click **Next: Configure Instance Details**.
4. Configure instance details as follows:
  - a. Set the **number of instances** to **1**.
  - b. **Purchasing option** – Leave **Request Spot Instances** unchecked.
  - c. **Network** – Select the VPC into which the instance will be deployed.
  - d. **Subnet** – Select the Subnet into which the instance will be deployed.
  - e. **Auto-assign Public IP** – Select **Disable**.
  - f. **Placement group** – Optional. The default is **No placement group**.
  - g. **IAM Role** – None
  - h. **Shutdown behavior** – Stop
  - i. **Enable termination protection** – Yes (select checkbox). This ensures that the Delphix Engine is not accidentally terminated.

- j. **Monitoring** – Optional
- k. **EBS-optimized instance** – Yes (select checkbox)
- l. **Tenancy** – Shared – Run a shared hardware instance
- m. **Network Interfaces**– Eth0

**Note** : This option will not appear if a default subnet is chosen. In this case, the first option below will apply.

- i. Auto-assign (default if using DHCP)
  - ii. Enter static IP in Primary IP field (recommended for consistency)
5. Click **Next: Add Storage**.
  6. By default, the Delphix Virtualization instance includes a 150GB OS volume. Ensure that this volume is set as a **General Purpose SSD (GP2)** type.
  7. Using the [Delphix Virtualization Engine Storage Calculator for AWS](#), enter information from the predetermined inventory into the worksheet. This will automatically calculate the number, size, and IOPS required for the EBS volumes.

In the above example, there are three (3) source databases listed with their current sizes. Each is estimated to have 5 virtual copies as well as a 14-day retention period for snapshots/backups. The calculator indicates to add four (4) EBS-provisioned IOPS volumes, each being 1250GB with 1000 IOPS.

**Note**

This calculator is only for estimating the anticipated storage size and IOPS needs. A manual adjustment may be required prior to or after launch depending on storage and performance needs.

8. Click **Add New Volume**. The new volume will be created using the specifications in the estimation provided. The below values are sample values set for a Volume Type. See [EBS configuration](#) for related information.
  - a. **Volume Type** – EBS
  - b. **Device** – Use default provided
  - c. **Size (GiB)** – 1250
  - d. **Volume Type** – Provisioned IOPS SSD (IO1) Delphix deploys as an EC2 instance on AWS using EBS volumes for storage. AWS provides the following options for Elastic Block Storage (EBS) storage volumes, namely
    - i. Standard
    - ii. General Purpose SSD (GP2)
    - iii. General Purpose SSD (GP3)
    - iv. Provisioned IOPS SSD (IO1)
  - e. **IOPS** – 1000
  - f. **Delete on Termination** – Optional. If this option is not set and the Delphix Engine is terminated, the EBS volumes will persist, and they will need to be removed manually.
  - g. **Encrypted** – Optional
9. Follow the above procedure for adding as many EBS volumes as specified in the calculator. Based on the example above, the storage configuration would look as follows:

**Step 4: Add Storage**

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. [Learn more](#) about storage options in Amazon EC2.

Volume Type	Device	Snapshot	Size (GiB)	Volume Type	IOPS	Throughput (MB/s)	Delete on Termination	Encrypted
Root	/dev/xvda	snap-1d44a945	150	General Purpose SSD (GP2)	450 / 3000	N/A	<input checked="" type="checkbox"/>	Not Encrypted
EBS	/dev/xvdb	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>
EBS	/dev/xvdc	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>
EBS	/dev/xvdd	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>
EBS	/dev/xvde	Search (case-insensit)	1250	Provisioned IOPS SSD (IO1)	1000	N/A	<input type="checkbox"/>	<input type="checkbox"/>

[Add New Volume](#)

General Purpose (SSD) volumes provide the ability to burst to 3000 IOPS per volume, independent of volume size, to meet the performance needs of most applications and also deliver a consistent baseline of 3 IOPS/GiB. [Set my root volume to General Purpose \(SSD\)](#).

Free tier eligible customers can get up to 30 GB of EBS General Purpose (SSD) or Magnetic storage. [Learn more](#) about free usage tier eligibility and usage restrictions.

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Tag Instance](#)

10. Verify the storage configuration matches the output from the calculator.
11. Click **Next: Tag Instance**.
12. To provide a name for the Delphix Virtualization Instance, enter it in the **Value** field corresponding to the **Key Name**.
13. Click **Next: Configure Security Group**.
14. Assign a security group. Do one of the following:
  - a. Create a new security group.
  - b. If an existing security group meets Delphix requirements, it can be selected. For more details on required and recommended ports for general Delphix usage, see [General network and connectivity requirements](#).
15. Click **Review and Launch**.
16. Verify the Delphix Virtualization Instance details and click **Launch**.
17. Proceed without a key pair.
18. Select the **I acknowledge** checkbox.
19. Click **Launch Instances**.
20. Click **View Instances**.
21. To complete the initial Delphix Virtualization Engine configuration, wait for the instance to be up and running. The status is available on the **Instances** page. Note that it can take up to 15 minutes for the first launch of Delphix, and even if the status of the server is “running” it may not yet be ready.

## Configuring the Delphix engine

1. Connect to the running Delphix instance with a web browser. Use the IP address or DNS name noted in the Instance Description.
2. Upon successful connection, the browser will automatically redirect to the **Delphix Setup Page**.
3. Refer to the standard [product deployment instructions](#) to complete the Delphix deployment.

## Logging in for the first time

On the first time login to the Delphix Engine, follow these steps:

1. Enter the default Administration User: **sysadmin**.

2. Enter **sysadmin** for the password (when installing a new engine via AWS AMI, the initial sysadmin password is the AWS Instance ID).

**Note**

Find the *<Instance ID>* in the **Instances** section of the AWS EC2 Management Console.

3. Once redirected, enter the following as prompted:
  - a. **Email address** for the admin account.
  - b. A new **password**. This password will be used for the Engine Administrator with the username "admin".
  - c. Confirm the new password.

**Note:**

From now on, this is the password used to log in to the Delphix Engine Administrator interface to manage Datasets.

4. Click **Continue**.

## Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in AWS.

Use Delphix documentation to learn how to:

- configure a database source
- configure target environments
- create virtual databases (VDBs)

## AWS RDS custom for Oracle and SQL server

### Overview

The Amazon Relational Database Service (Amazon RDS) makes it easy to set up, operate, and scale a relational database in the cloud. It allows organizations to automate time-consuming administration tasks such as hardware provisioning, database setup, patching, and backups. It frees focus that can be utilized on applications, eliminating extra overhead. Amazon RDS is available for Oracle and SQL Server, amongst other database services.

### Delphix AWS RDS custom support for Oracle and SQL server

AWS has announced a new version of their RDS databases, thus, Delphix is adding AWS RDS Custom support for Oracle. AWS RDS Custom is an RDS service that allows Delphix to access the operating system and database level functions required to provision vDBs into the AWS RDS PaaS (Product as a Service) database service.

With AWS RDS Custom, organizations using Delphix can obtain the full benefits of PaaS and Delphix automation for their target environments.

- Users ingest data from production in RDS Oracle/SQL Server, mask the data, and provision secure copies back to RDS. All Delphix automation tools work and also manual operations via the UI.
- Delphix data compression and block sharing capabilities will allow organizations to potentially reduce their AWS RDS storage consumption.

For additional questions or use case evaluations, please contact Delphix Support.

## Deployment for Microsoft Azure

### Overview

This article outlines the virtual machine requirements, including memory and data storage, for deploying the Delphix Engine on the Azure Public Cloud and Government Cloud. Once the requirements listed on this page are reviewed, refer to the next articles on Azure deployment:

- [Prerequisites to deploying in Microsoft Azure](#)
- [Procedure for deploying in Microsoft Azure](#)

### Instance types

The following is a list of instance types that are supported to deploy Delphix on Microsoft Azure. Delphix periodically certifies new instance types, which will be added to the list here.

Requirements	Notes
<b>General purpose</b>	
<ul style="list-style-type: none"> <li>• Dsv2-series</li> <li>• Dsv3-series</li> </ul>	<p>Network bandwidth and IOPS limits are specific to each instance type:</p> <ul style="list-style-type: none"> <li>• See <a href="#">Dsv2 specifications</a> for more details.</li> <li>• See <a href="#">DSv3 specifications</a> for more details.</li> </ul> <p>Required minimum size of 8 vCPU and 64G memory. Recommended 128G of memory.</p>
<b>Memory-optimized</b>	
<ul style="list-style-type: none"> <li>• Esv3-series</li> <li>• Esv4-series</li> <li>• Esv5-series</li> </ul>	<p>Network bandwidth and IOPS limits are specific to each instance type:</p> <ul style="list-style-type: none"> <li>• See <a href="#">ESv3 specifications</a> for more details.</li> <li>• See <a href="#">Esv4 specifications</a> for more details.</li> <li>• See <a href="#">Esv5 specifications</a> for more details.</li> </ul> <p>Required minimum size of 8 vCPU and 64G memory. Recommended 128G of memory.</p>

### Network configuration

The use of Azure Accelerated Networking is supported for Delphix Engines and is recommended to maximize network performance. Accelerated Networking provides more bandwidth with more consistent and lower network latencies.

Requirements	Notes
Azure virtual network (VNet)	The Delphix Engine must have $\leq 1$ ms of latency to the Target and Staging environments. Longer latencies are permitted between the Delphix Engine and Source environments, but may impact Snapsync timings. VNET peering may be used, as long as latency requirements are met. For very low latency requirements, consider Proximity Placement Groups for Delphix Engine, Target, and Staging.
Network security group (NSG)	The security group must be modified that allows access to all networking ports used by the Delphix Engine and the various source/target platforms. See <a href="#">General network and connectivity requirements</a> for information about specific port configurations. See <a href="#">Network performance configuration options</a> for information about network performance tuning.

## Storage configuration

Requirements	Notes
General Storage Configuration	<ul style="list-style-type: none"> <li>• Allocate initial storage equal to the size of the physical source databases. For high redo rates and/or high DB change rates, allocate an additional 10-20% storage.</li> <li>• Add storage when storage capacity approaches 30% free.</li> <li>• Delphix recommends using a minimum of four equally sized storage disks to run the Delphix Engine. This allows the Delphix File System (DxFS) to assure its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.</li> <li>• Maximize Delphix Engine RAM for a larger system cache to service reads.</li> <li>• See <a href="#">Delphix storage migration</a></li> </ul>
Azure Premium Storage	<ul style="list-style-type: none"> <li>• Premium storage utilizes solid-state drives (SSDs). Ultra disk is also supported.</li> <li>• Devices up to 32TB are supported.</li> <li>• A maximum of 256TB is supported.</li> <li>• Cache setting of NONE.</li> <li>• I/O requests of up to 256 kilobytes (KB) are counted as a single I/O operation (IOP) for provisioned IOPS volumes.</li> <li>• IOPS vary based on storage size with a maximum of 20,000 IOPS.</li> </ul>

## Extensions

Azure VM Extensions are not currently supported.

## Prerequisites to deploying in Azure

### Overview

This article outlines the prerequisites for deployment of the Delphix Engine on Azure. The setup user should have experience launching and configuring instances in the Microsoft Azure environment. Review and complete the tasks in the next section before deployment.

### Prerequisites

1. Review [Checklist of information required for installation and configuration](#).
2. Determine which virtual private cloud (VPC) is being used when launching the Virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet where the virtual databases (VDBs) will be created.

**[-]** Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.

3. Make sure that the necessary ports are open.

**[-]** Using the Delphix Engine for Azure will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform:

1. [Network and Connectivity Requirements for Oracle Environments](#)
2. [Network Access Requirements for SQL Server](#)

4. Update Security Group settings to accommodate the necessary connections.

- a. Select the same **Network Security Group** that the current (or future) non-production Azure virtual machines utilize.
- b. Modify the Network Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines. See links above for information about specific port configurations.

5. Allocate storage.

**[-]** It is helpful to first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).

- a. All data storage disks must be comprised of Azure Premium Storage devices. Delphix recommends using a minimum total of five disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.
- b. Azure premium storage devices have different levels of guaranteed IOPs that vary from 120 IOPs to 20,000 IOPs. Please refer to [Microsoft's documentation](#) to ensure that the selected devices will meet the requirements for your deployment. UltraHD disk storage is supported for performance-sensitive customers.

- c. It is highly recommended to use Azure-managed disks.
- d. Use the guidelines outlined in [Deployment for Microsoft Azure](#)

## Procedure for deploying in Azure

### Overview

This article outlines the procedure for deploying the Delphix Engine in Microsoft Azure.

### Deploying the Delphix engine

1. Navigate to the Azure Marketplace at <https://azuremarketplace.microsoft.com>
2. In the **Search** field, enter **Delphix**.
3. Select the **Delphix Virtualization for Azure (3TB)** for an hourly subscription or **Delphix DataOps Platform for Azure** for customers with existing licenses.
4. Review the information on the initial Marketplace page.
5. Click **GET IT NOW**.
6. Click **Create**.
7. Follow the creation wizard to deploy the Delphix Engine.
8. Provide the basic information for the Delphix Engine.
  - a. Select a name for the virtual machine.
  - b. For the OS disk type, select **Premium SSD**.
  - c. Enter a **username** and **password**.  
Info : This information is never used but is part of the built-in wizard used by the marketplace. Any information provided in these fields is discarded.
  - d. Select your **Subscription, Resource group, and Location**.
  - e. Click **OK**.
9. Select the **Size** of the virtual machine you want to deploy. For supported instance types and capabilities, See [Virtual machine requirements for Azure platform](#)  
Each instance type will determine the limits for:
  - Network bandwidth
  - Maximum data disk
  - Total IOPS
10. Click **Select**.
11. Configure the **Settings** for this virtual machine:
  - a. Use managed disks.
  - b. Select or create a **Virtual Network** and **Subnet**.
  - c. Optional: select a **Public IP address** (this will make an engine accessible over the internet)
  - d. Select or create a **Network Security Group**.
  - e. **Extensions** and **High Availability sets** are not currently supported. Please ensure that no extensions or availability sets have been configured.
  - f. Enable **Boot diagnostics**.
12. Click **OK**.
13. Review the configuration in the **Summary** screen and click **OK**.
14. Review the offer details in the **Buy** screen and click **Purchase** to deploy the Delphix Engine.

### Configuring the Delphix engine virtual machine

1. From the **Azure Portal** sidebar, select **Virtual Machines**. The running virtual machines will be displayed.
2. Click the virtual machine's **name** to open its detailed information.
3. Click **Disks** to open the detailed panel.
4. Click **Add data disk**.
5. Create a new device:

- a. In the **Create disk** drop-down menu, select **Create managed disk**. This will open the managed disk wizard.
  - b. In the wizard, ensure that the **Account type** indicates **Premium (SSD)** and that the **Source Type** shows **None (empty disk)**.
  - c. Select the size of the device to create. Note that the device size will determine the IOPS limit for that device.
  - d. Click **Create**.
6. Once the device is created, change the **Host Caching** parameter for that device to **None**.
  7. Repeat the above steps to create additional disks.
  8. Once adding all the disks is complete, click **Save**.
  9. Optional: modify the virtual machine's **Network Security Group**.
    - a. From the side panel of the virtual machine's detail screen, click **Network interfaces**.
    - b. Click the name of the network interfaces to modify.
    - c. From the **Network interface** details window, click the **Network security group** specified in the **Overview** pane. In the example below, the user would click **delphix-engine-nsg**:
    - d. From the **Network security group** details pane, modify the **Inbound security rules** and/or the **Outbound security rules** by selecting from the side panel and clicking **Add**.
    - e. Add the appropriate rule and click **OK**. The screenshot below shows adding the inbound rule for the Delphix Session Protocol.
    - f. Repeat the above steps for all the rules that should be added.

## Configuring the Delphix engine

1. Connect to the running Delphix instance with a web browser. Use the Public IP address or DNS name noted in the **Network Interface** Panel. Upon successful connection, the browser will automatically redirect to the **Delphix Setup Page**.
2. Refer to the standard [product deployment instructions](#) to complete the Delphix deployment.

## Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in Azure.

Use Delphix documentation to learn how to:

- configure a database source
- configure the target environments
- create virtual databases (VDBs)

## Enabling Azure accelerated networking

### Overview

This article describes how to enable Azure Accelerated Networking. If a VM was created without Accelerated Networking, enabling this feature on an existing VM is possible. The VM must meet the following prerequisites:

- VM must be a supported size for Accelerated Networking
- VM must be a supported Azure Gallery image (and kernel version for Linux)
- All individual VMs or VMs in an availability set must be stopped/deallocated before enabling Accelerated Networking on any NIC

For more information, please see the [Azure documentation](#)

### Individual VMs and VMs in an availability set

Stop/deallocate the VM or, if an Availability Set, all the VMs in the Set:

- If the VM was created individually (without an availability set), only the individual VM needs to stop/deallocate to enable Accelerated Networking.
- If the VM was created with an availability set, all VMs contained in the availability set will need to stop/deallocate before enabling Accelerated Networking on any Network Interface Card (NIC).

### Azure CLI

```
az vm deallocate \  
  --resource-group myResourceGroup \  
  --name myVM
```

Once stopped, enable Accelerated Networking on the NIC of the VM:

### Azure CLI

```
az network nic update \  
  --name myNic \  
  --resource-group myResourceGroup \  
  --accelerated-networking true
```

Restart the VM (or all VMs if using an availability set) and confirm that Accelerated Networking is enabled:

### Azure CLI

```
az vm start --resource-group myResourceGroup \  
  --name myVM
```

After the restart, the Mellanox VF (Virtual Function) device will be exposed to the VM.

## Deployment for Google cloud platform

### Overview

This article covers the virtual machine requirements, including memory and data storage, for the deployment of the Delphix Engine on Google Cloud Platform (GCP). Once the requirements listed on this page are reviewed, refer to the next articles on GCP deployment:

- [Prerequisites to deploying in GCP](#)
- [Procedure for deploying in GCP](#)

### Machine types

The following is a list of instance types that are supported to deploy Delphix on GCP. Delphix periodically certifies new instance types, which will be added to the list here.

Recommendations	Notes
<ul style="list-style-type: none"> <li>• N2 standard</li> <li>• N2 high-mem</li> </ul>	<ul style="list-style-type: none"> <li>• The Delphix Engine most closely resembles a storage appliance and performs best when provisioned using a storage-optimized instance type.</li> <li>• Larger instance types provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions.</li> <li>• Larger instances also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance.</li> <li>• Recommended minimum size of 8 vCPU and 64G memory.</li> </ul>

### Network configuration

Requirements	Notes
Virtual private cloud	<p>The Delphix Engine and all of the source and target environments must be deployed in a VPC network to ensure that private IP addresses are static and do not change when restarting instances.</p> <p>When adding environments to the Delphix Engine, use the host's VPC (static private) IP addresses.</p>
Static public IP	<p>The GCP Delphix instance must be launched with a static IP address; however, the default behavior for VPC instances is to launch with a dynamic public IP address – which can change whenever the instance restarts. If using a public IP address for the Delphix Engine, static IP addresses can be assigned using the <a href="#">Google cloud documentation</a></p>

Requirements	Notes
Security group configuration	<p>The default security group will only open port 22 for SSH access. The security group must be modified to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines.</p> <p>See <a href="#">Network performance configuration options</a> for information about network performance tuning.</p> <p>See <a href="#">General network and connectivity requirements</a> for information about specific port configurations.</p>

## Storage configuration

Requirements	Notes
General storage configuration	<p>Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %.</p> <p>Add storage when storage capacity approaches 30% free.</p> <p>Delphix recommends using a minimum of four equally sized storage disks to run the Delphix Engine. This allows the Delphix File System (DxFS) to assure its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.</p>

## Prerequisites to deploying in GCP

### Overview

This article outlines the prerequisites for deployment of the Delphix Engine on GCP. The setup user should have experience launching and configuring instances in the Google Cloud Platform environment. Review and complete the tasks in the next section before deployment.

### Prerequisites

1. Review the [Checklist of information required for installation and configuration](#)
2. Make sure that the Google account being used to deploy the Delphix Engine has an appropriate level of enablement for the **Delphix virtualization for GCP** subscription.
3. Determine which virtual private cloud (VPC) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet in which the virtual databases (VDBs) will be created.

**Note:**

Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.

4. Make sure that the necessary ports are open.

**Note:**

Using the Delphix Engine for GCP will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.

- a. [Network and Connectivity Requirements for Oracle Environments](#)
- b. [Network and Connectivity Requirements for SQL Server Environments](#)
- c. [Network and Connectivity Requirements for SAP ASE Base Environments](#)
- d. [Network and Connectivity Requirements for Db2 Environments](#)
5. Update Security Group settings to accommodate the necessary connections.
  - a. Select the same Security Group that the current (or future) non-production EC2 compute nodes utilize.
  - b. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See links above for information about specific port configurations.
6. Allocate storage.

- a. To properly size the initial storage capacity and determine the number and size of Provisioned IOPs Volumes required, download and utilize the [Delphix-Dynamic-Data-Platform-Storage-Calculator](#)

**Note:**

It is helpful to first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).

- b. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.

### Additional GCP configuration notes

- Delphix supports both Zonal and Regional SSD persistent disks.

## Procedure for deploying in GCP

### Overview

This article outlines the procedure for deploying the Delphix Engine using a tar.gz file in Google Cloud Console or in Google Cloud Marketplace.

### Deployment in Google cloud console

1. Download the latest **Delphix Platform for GCP** tar.gz file from <https://download.delphix.com/>.
2. Create a **GCP storage bucket** and upload the tar.gz file from the first step.
3. Once the upload is complete, navigate to **Compute Engine > Images** and select **Create Image**.
4. In the **Create Image** dialog, provide the following information.
  - a. Image Name
  - b. Source: Cloud Storage File
  - c. Select the bucket and newly uploaded Delphix File.
  - d. Location: Multi-Regional or Regional. (To deploy Delphix in multiple regions - select **Multi-Region**)
  - e. Family: Optional
  - f. Description: Optional
  - g. Labels: Optional
  - h. Encryption: Select based on the organization's policy
  - i. Click **Create**. (Creating the image could take some time)
5. Once the image creation is complete, select the newly created image and create an instance from it.
6. Configure the instance creation screen with the following items.
  - a. Identify and select the region and zone to run Virtual Databases.
  - b. Choose a supported machine type, commensurate with the expected workload.
  - c. Change/modify the **Boot Disk** to **SSD Persistent Disk**. (Defaults to **Standard Persistent Disk**)
  - d. Add **Data Disks** (minimum of four recommended) with a total size at least equal to the total source DB sizes. Be sure to utilize SSD Persistent Disks.
  - e. Update Networking, commensurate with the Network and Subnet(s) on which the target non-production instances reside. Note, a “target” is an instance running the DB platform identical to the source DBs.
  - f. Once all of the necessary instance information has been configured, select **Create**.
  - g. Wait for the instance to be created/available and connect to the newly deployed Engine using the assigned IP/hostname via the support web browser.

### Deployment in Google cloud marketplace

1. Login to the **Google Cloud Marketplace**.
2. In the **Search** field, enter **Delphix**.
3. Select the **Delphix Data Virtualization for GCP (3TB)**.
4. Review the information on the initial Marketplace page.
5. Click **Launch**.
6. Review the deployment configuration and software subscription information.
7. Accept Google Cloud’s and Delphix Corp’s Terms of Service.
8. Click **Deploy**, which will start the deployment of the instance.
9. After the deployment, add equally-sized data disks to the instance.

## Configuring the Delphix engine

1. Connect to the running Delphix instance with a web browser. Use the IP address or DNS name noted in the Instance Description. Upon successful connection, the browser will automatically redirect to the **Delphix Setup Page**.
2. Refer to the standard [product deployment instructions](#) to complete the Delphix deployment.

## Next Steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in Google Cloud Platform.

Use Delphix documentation to learn how to:

- configure a database source
- configure the target environments
- configure virtual databases (VDBs)

## Deployment for OCI

This article outlines the virtual machine requirements, including memory and data storage, for deploying the Delphix Engine on Oracle Cloud Infrastructure (OCI). Once the requirements listed on this page are reviewed, refer to the next articles on OCI deployment:

- [Prerequisites to deploying in OCI](#)
- [Procedure for deploying in OCI](#)

## Compute image types

Delphix distributes product images for OCI using the QCOW2 image type. Compute Images must be imported into OCI using the Paravirtualized launch mode; currently, images using the Emulated launch mode are not supported.

## Supported shapes

The following is a list of shapes that are supported to deploy Delphix on OCI.

Requirements	Notes
Large Memory Instances (preferred) <ul style="list-style-type: none"> <li>• VM.Standard2</li> <li>• VM.Standard.E4.Flex</li> </ul>	<ul style="list-style-type: none"> <li>• The Delphix Engine most closely resembles a storage appliance and performs best when provisioned using a storage-optimized shape.</li> <li>• Larger shapes provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions.</li> <li>• Larger shapes also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance.</li> <li>• Recommended minimum size of 8 vCPU and 64G memory.</li> </ul>

## Network configuration

Requirements	Notes
Virtual cloud network (VCN)	<ul style="list-style-type: none"> <li>• The Delphix Engine and all of the source and target environments must be deployed in a VCN to ensure that private IP addresses are static and do not change when restarting instances.</li> <li>• By default, OCI subnets are considered public. When defining a subnet, it is recommended to set it as private. Unless required by the environment, the VCN should not include a Public Subnet.</li> <li>• When adding environments to the Delphix Engine, use the host's VCN (static private) IP addresses.</li> </ul>
Static private IP	<ul style="list-style-type: none"> <li>• The Delphix instance should be launched with a static private IP address. For security reasons, it is encouraged to avoid configuring the engine with a Public IP address; however, it could be passable to use a dynamic Public IP address in addition to a static Private IP address if the environment requires such access.</li> </ul>

Requirements	Notes
Security rules configuration	<ul style="list-style-type: none"> <li>OCI allows two firewall features: <b>Network Security Groups (NSGs)</b> and <b>Security Lists</b>. Oracle recommends the use of NSGs over Security Lists because NSGs let the VCN subnet architecture be separate from the application security requirements. More information can be found in this <a href="#">Oracle documentation</a></li> <li>A VCN will use a Security List to define default rules. By default, the security list will only open port 22 for SSH access. The Security List must be modified, or new NSGs created, to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines.</li> <li>This dual implementation of firewall or security rules may be different from other clouds, please see OCI documentation for best practices.</li> <li>See <a href="#">Network performance configuration options</a> for information about network performance tuning.</li> <li>See <a href="#">General network and connectivity requirements</a> for information about specific port configurations.</li> </ul>

## General storage configuration

Requirements	Notes
General storage configuration	<ul style="list-style-type: none"> <li>Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %.</li> <li>Add storage when storage capacity approaches 30% free.</li> <li>Delphix recommends using a minimum of four equally sized storage disks to run the Delphix Engine. This allows the Delphix File System (DxFS) to assure its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.</li> <li>Must use Block Volume for data storage.</li> <li>Block Volumes must be attached using Paravirtualized mode.</li> </ul>
OCI storage configuration	<ul style="list-style-type: none"> <li>Currently supported Shapes only support Block Volumes; File Storage is not supported.</li> <li>Paravirtualized block devices are required; currently, iSCSI devices are not supported.</li> <li>Elastic Performance Configuration Options (aka Volume Performance Policy): use Higher Performance.</li> </ul>

## Additional OCI configuration notes

- When running low on storage space, Delphix recommends adding additional equivalently sized block storage volumes, or devices, instead of resizing existing volumes.
- If existing storage volumes must be expanded, this must be done using the “online” resizing strategy specified in OCI documentation; “offline” storage resizing is not supported and may lead to unexpected downtime. If an existing storage volume is expanded, use the Setup or sysadmin interface to expand each

storage “device” or volume. The additional storage, as a result of a resize, will not be available for use until the storage devices are explicitly instructed to make use of the additional space.

- If expanding storage volumes, it is recommended that all volumes are expanded to the same size. When storage volumes or devices are the same size, the Delphix product is able to balance I/O distribution among the disks for optimal performance.
- Hot removal of storage volumes is not supported.

## Prerequisites to deploying OCI

### Overview

This article outlines the prerequisites for deployment of the Delphix Engine on OCI. The setup user should have experience launching and configuring instances in the Oracle Cloud Infrastructure environment. Review and complete the tasks in the next section before deployment.

### Prerequisites

1. Contact a Delphix representative to request this capability. Delphix will assist in assuring that all Oracle Cloud requirements are met to successfully run a Delphix Engine with the most appropriate configuration for the use case.
2. Review the [Checklist of information required for installation and configuration](#)
3. Review Oracle's [Creating an instance documentation](#)
4. Make sure that the Oracle account being used to deploy the Delphix Engine has an appropriate level of permissions to upload files to a Bucket in Object Storage, and use that object to produce a Custom Image.
5. Determine which virtual cloud network (VCN) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VCN/subnet in which the virtual databases (VDBs) will be created.

**Note:**

Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.

6. Make sure that the necessary ports are open.  
Using the Delphix Engine for OCI will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.
  - [Network and Connectivity Requirements for Oracle Environments](#)
  - [Network and Connectivity Requirements for SQL Server Environments](#)
  - [Network and Connectivity Requirements for SAP ASE Environments](#)
  - [Network and Connectivity Requirements for Db2 Environments](#)
7. Update Security Group (or Security List) settings to accommodate the necessary connections.
  - a. Select the same Security Group that your current (or future) non-production compute nodes utilize.
  - b. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See [Oracle Network Security Groups](#)
8. Allocate storage.
  - a. To properly size the initial storage capacity and determine the number and size of Provisioned IOPs Volumes required, download and utilize the [Delphix-dynamic-data-platform-storage-calculator](#)

**Note:**  
It is helpful to first create a list of the data sources intended for making dSources. A data source is typically a production database linked to the Virtualization Engine, enabling to create virtual, full, read-write copies of the source within minutes. The list should include the database name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).

  - b. Delphix only supports using Block Volume devices for data storage. These block devices must be attached to the Delphix Engine using the Paravirtualized attach mode (iSCSI is not currently supported). Block Volumes must be provisioned in the same Availability Domain as the Delphix Engine, otherwise, they will not be discoverable. Block Volumes should be configured to use the “[Higher performance](#)” performance option. All Block Volumes attached to a single Delphix Engine

should be of the same size. A minimum of four (4) Block Volumes should be attached to a Delphix Engine.

9. During the Manual Deployment option, use the guidelines outlined in [Virtual machine requirements for OCI](#)

## Procedure for deploying in OCI

### Overview

This article outlines the procedure for deploying the Delphix Engine in Oracle Cloud Infrastructure.

### Download and verify the Delphix engine image

1. Contact an account manager to request access to the OCI variant of the Delphix product.
2. Follow the link given by the Delphix solutions architect. Download the **Delphix\_6.x.x.x\_....Standard\_OCI.qcow2** file and the **SHA256SUMS** file.
3. Once both files have finished downloading and are in the same directory, run the following command to verify the download: 

```
$ grep -i OCI.qcow2 ./SHA256SUMS | sed -E 's,Appliance_Images/(Controlled_Availability/)?,,g' | sha256sum --check
```

### Upload the Delphix engine image as an object

1. Authenticate with OCI and navigate to the [Infrastructure console](#)
2. Use the navigation menu to reach the [Object storage buckets, core infrastructure, page](#) (Menu > Object Storage > Object Storage).
3. Set the **List Scope Compartment**. This will depend on the organization's strategy for managing OCI resources.
4. [Create a storage bucket](#) or select an existing bucket.
5. Click the blue **Upload** button.
6. In the **Upload Objects** modal window, specify an optional prefix and choose the OCI specific QCOW2 file that was previously downloaded.
7. Click the blue **Upload** button.

### Creating a custom compute image from an object

1. Authenticate with OCI and navigate to the [Infrastructure console](#)
2. Use the navigation menu to reach the [Compute custom images, core infrastructure, page](#) (Menu > Compute > Custom Images).
3. Set the **List Scope Compartment**.
4. Click the blue **Image Import** button.
5. In the **Import Image** modal window, select a suitable compartment in the **Create In Compartment** field that conforms to the organization's strategy on managing OCI resources.
6. In the **Name** field enter a unique name to identify the Custom Compute Image (using the same name as the image object from the previous step is recommended). Upload the Delphix Engine Image as an Object.
7. For **Operating System** select **Linux**.
8. Next, identify an object by specifying its Compartment, Bucket, and Object Name. Or, specify an Object Storage URL.  
**Note:**  
The Object Details will identify this value as **URL Path (URI)**.
9. For **Image Type** select **QCOW2**.
10. For **Launch Mode** select **Paravirtualized Mode**.
11. For organizations that have a tagging policy for cloud-based resources, expand the **Tagging Options** section, and define tags.
12. Click the blue **Import Image** button.

## Launching the Delphix engine

1. Authenticate with OCI and navigate to the [Infrastructure Console](#)
2. Use the navigation menu to reach the [Compute instances, core infrastructure, page](#) (Menu > Compute > Instances).
3. Set the **List Scope Compartment**.
4. Click the blue **Create Instance** button.
5. In the **Create Compute Instance** window pane, specify a unique name for the VM.
6. For the **Create In Compartment** field, select a suitable compartment that conforms to the organization's strategy on managing OCI resources.
7. In the **Image or operating system** section, click the **Change Image** button. Switch to the **Custom Images** tab. Find the Delphix image that corresponds to the instance being deployed. Click the blue **Select Image** button.
 

**Note:**  
If the Delphix Custom Image is not visible, look for the **Change Compartment** option near the top of the current window pane.
8. Each Availability Domain has its own quota, it is ok to use AD-1, AD-2, or AD-3 - but, be sure to make note of which Availability Domain is being used.
 

**Note:**  
Compute Instances and attached Storage will need to be in the same Availability Domain.
9. In the **Shape** section, click the **Change Shape** button. For **Instance type**, specify **Virtual Machine**. For **Shape series**, use **Intel Skylake**. Select an OCI Shape that is supported by Delphix.
10. Continue on to the **Configure networking** section.
  - a. If the network is not specified correctly, it is likely that firewall issues will occur. In this case, please consult the organization's IT or DevOps team. If the organization is using Network Security Groups (NSGs), mark the **Use Network Security Groups to Control Traffic** checkbox after consulting the appropriate teams. Last, select the **Do Not Assign a Public IP Address** radio button.
11. The **Boot Volume** section can be skipped.
12. In the **Add SSH Keys**, select the **No SSH Keys** radio option. The Delphix product is a closed appliance and manages users independently.
13. In general, all of the Advanced Options can be skipped. For organizations that have a tagging policy for cloud-based resources, expand into the Advanced Management section, and look for the **Tagging** sub-section to define tags.
14. Click the blue **Create** button - wait about 2-5 minutes for the Delphix Engine instance to boot.

## Create block storage volumes

1. Authenticate with OCI and navigate to the [Infrastructure console](#)
2. Use the navigation menu to reach the [Block volumes, core infrastructure, page](#) (Menu > Block Storage > Block Volumes).
3. Set the **List Scope Compartment**.
4. Click the blue **Create Block Volume** button.
5. In the **Create Block Volume** modal window, specify a unique name for this Block Volume. It can be helpful if this name is descriptive or identifies the VM it is intended to be attached to and ends in a sequence number.
6. For the **Availability Domain**, this value MUST be the same Availability Domain used for the Delphix Engine instance, otherwise, this volume will not be available for use.
7. In the **Volume Size and Performance** section, select the **Custom** option. Set the size of the volume to be sufficiently large (with room for growth) to support the databases that will be virtualized, or masked, by this Delphix Engine. Set the **Default Volume Performance** to the **Higher Performance** setting.
8. A **Backup Policy** is not required and can be left blank or **No Backup Policy Selected**. However, depending on the organization's needs, consider selecting a Backup Policy.
9. For **Encryption**, the default option of **Encrypt Using Oracle-Managed Keys** is permissible. Optionally, for independent encryption keys, use the **Encrypt Using Customer-Managed Keys** option.

10. For organizations that have a tagging policy for cloud-based resources, expand the **Tagging Options** section and define tags.
11. Uncheck the checkbox that says **View Detail Page After This Block Volume is Created**. This will prevent navigating away from the Block Volumes page because multiple Block Volumes will need to be created at the same time.
12. Click the blue **Create Block Volume** button.
13. A Delphix Engine requires a minimum of four equally sized Block Volumes for data storage. Repeat Steps 4-12 as many times as necessary.

## Attach block storage volumes

1. Authenticate with OCI and navigate to the [Infrastructure console](#)
2. Use the navigation menu to reach the [Block volumes, core infrastructure, page](#) (Menu > Block Storage > Block Volumes).
3. Set the **List Scope Compartment**.
4. From the list of pre-existing Block Volumes, identify the resources being attached to the Delphix Engine and wait until the volume state becomes Available.
5. Select one of the **Block Volumes** to enter the **Block Volume Details** page.
6. On the left-hand side, locate the **Resources** menu and select **Attached Instances**.
7. If the Block Volume has not been previously attached to another VM, selecting the blue **Attach to Instance** button will be available.
8. In the **Attach to Instance** modal window, specify the **Attachment Type** as **Paravirtualized**. Currently, iSCSI is not supported.
9. For **Access Type** use the **READ/WRITE** option.
10. Next, identify a Delphix Engine by selecting an instance or by specifying an instance OCID. If the Delphix Engine instance is not shown in the **Select an Instance** drop-down menu, the **Change Compartment** option could be needed. Block Volumes can only be attached to VM instances that were created in the same Availability Domain - if these values do not match, either re-provision Block Volumes or the Delphix Engine in the correct Availability Domain.
11. Click the blue **Attach** button.
12. Repeat Steps 4-11 until all associated Block Volume resources have been attached to the Delphix Engine instance.

## Configuring the Delphix engine

1. Connect to the running Delphix Engine instance with a web browser. Use the IP address or FQDN noted in the Instance Description. Upon successful connection, the browser will display a login prompt to enter the Delphix Setup Page.
2. Refer to the standard [product deployment instructions](#) to complete the Delphix deployment.

## Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in OCI.

Use Delphix documentation to learn how to:

- configure a database source
- configure target environments
- create virtual databases (VDBs)

## Deployment for IBM cloud

### Overview

This article covers the virtual machine requirements, including memory and data storage, for the deployment of the Delphix Engine on IBM Cloud. Once the requirements listed on this page are reviewed, refer to the next articles on GCP deployment:

- [Prerequisites for deploying in IBM Cloud](#)
- [Procedure for deploying in IBM Cloud](#)

### Supported profiles

The following is a list of profiles that are supported to deploy Delphix on IBM Cloud.

Requirements	Notes
<ul style="list-style-type: none"> <li>• mx2</li> </ul>	<ul style="list-style-type: none"> <li>• The Delphix Engine most closely resembles a storage appliance and performs best when provisioned using a storage-optimized profile.</li> <li>• Larger profiles provide more CPU, which can prevent resource shortfalls under high I/O throughput conditions.</li> <li>• Larger profiles also provide more memory, which the Delphix Engine uses to cache database blocks. More memory will provide better read performance.</li> </ul>

### Network configuration

Requirements	Notes
Virtual server instances	<ul style="list-style-type: none"> <li>• Deploy the Delphix Engine and all of the source and target environments in the same VPC network.</li> <li>• When adding environments to the Delphix Engine, use the host's VPC IP addresses.</li> </ul>
Security configuration	<ul style="list-style-type: none"> <li>• The default security group will only open port 22 for SSH access. The security group must be modified to allow access to all of the networking ports used by the Delphix Engine and the various source and target engines.</li> <li>• See <a href="#">Network performance configuration options</a> for information about network performance tuning.</li> <li>• See <a href="#">General network and connectivity requirements</a> for information about specific port configurations.</li> <li>• Reference: <a href="#">IBM cloud security and compliance</a> documentation</li> </ul>

#### Port Requirements

Using the Delphix Engine for OCI will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.

- [Network and connectivity requirements for Oracle environments](#)
- [Network and connectivity requirements for SQL Server environments](#)
- [Network and connectivity requirements for SAP ASE environments](#)
- [Network and connectivity requirements for Db2 environments](#)

## General storage configuration

Requirements	Notes
General storage configuration	<ul style="list-style-type: none"> <li>• Allocate initial storage equal to the size of the physical source database storage. For high redo rates and/or high DB change rates, allocate an additional 10-20 %.</li> <li>• Add storage when storage capacity approaches 30% free.</li> <li>• Delphix recommends using a minimum of four equally sized storage disks to run the Delphix Engine. This allows the Delphix File System (DxFS) to assure its file systems are always consistent on disk without additional serialization. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.</li> <li>• Reference: <a href="#">IBM block storage documentation</a></li> </ul>

## Additional IBM configuration notes

- Expandable volume is a beta feature that is available for evaluation and testing purposes. This feature is available in the US South, US East, London, and France regions. Contact an IBM Sales representative if interested in getting access at <https://cloud.ibm.com/docs/vpc?topic=vpc-expanding-block-storage-volumes>.
- After performing an “online” resize/expansion of a storage volume using IBM Cloud tools, then use the Delphix sysadmin interface to “Expand” the storage device; otherwise, the newly allocated storage space, from the resize/expansion, will not be used.
- Resize/expansion of a storage volume using IBM Cloud is not supported while the Delphix engine is in a stopped state.
- Removing a storage volume should be done while the machine is running. First use the Delphix sysadmin CLI interface to “Unconfigure” the storage device, then remove it from IBM Cloud.

## Prerequisites for deploying in IBM Cloud

### Overview

This article outlines the prerequisites for deployment of the Delphix Engine on IBM Cloud. The setup user should have experience launching and configuring instances in the IBM Cloud environment. Review and complete the tasks in the next section before deployment.

### Prerequisites

1. A Delphix software license is required. New users should [contact Delphix](#) to get started.
2. Review the [Checklist of information required for installation and configuration](#)
3. Review IBM's [cloud documentation](#) for IBM Cloud-specific information.
4. Determine which virtual private cloud (VPC) is being used when launching the virtualization instance. To maximize performance, deploy the Delphix Engine instance in the same VCN/subnet in which the virtual databases (VDBs) will be created. **Note:** Provisioning a VDB requires a compute instance running the same database engine as the source. Please note, however, that the target instance only needs storage to accommodate the OS, database platform binaries, etc., because Delphix delivers all of the data files.
5. Make sure that the necessary ports are open. **Note:** Using the Delphix Engine for GCP will require connections to source and target database servers. Such connections require various ports to be open, enabling communications. For a detailed list of the network and port requirements, click the link that corresponds with the relevant database platform.
  - [Network and connectivity requirements for Oracle environments](#)
  - [Network access requirements for SQL server](#)
  - [Network and connectivity requirements for SAP ASE environments](#)
  - [Network and connectivity requirements for Db2 environments](#)
6. Update Security Group settings to accommodate the necessary connections.
7. Select the same Network Security Group that your current (or future) non-production Azure virtual machines utilize.
8. Modify the Security Group to allow access to all of the networking ports used by the Delphix Engine and the various source and target platforms. See the links above for information about specific port configurations.
9. Allocate storage.

**i** It is helpful to first create a list of the data sources from which you intend to make dSources. A data source is typically a production database that you link to the Delphix Engine, enabling you to create virtual, full, read-write copies of the source within minutes. The list should include the database's name, platform (for example, Oracle or SQL Server), current size (in GB), the estimated number of virtual copies, and retention period (in days) of snapshots (backup copies).

- a. All data storage disks must be comprised of Premium Storage devices.
- b. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queueing more I/O operations to its storage.
- c. Premium storage devices have different levels of guaranteed IOPs that vary from 120 IOPs to 7500 IOPs. Please refer to IBM Cloud documentation to ensure that the selected devices will meet the requirements for your deployment.
- d. Use the guidelines outlined in Procedure for Deploying in IBM Cloud.

## Procedure for deploying in the IBM Cloud

### Overview

This article outlines the procedure for deploying the Delphix Engine in IBM Cloud. There are two methods for deploying a Delphix Engine in the IBM Cloud using the [Software Catalog](#) or [Manually Uploading the Delphix Image](#)

### Deploying from the IBM software catalog

1. Navigate to the [IBM Software Catalog](#) and search for Delphix.
2. Select the Delphix Data Virtualization Tile or Masking Tile for the Masking product.
3. Scroll down to the Deployment Values section and input specifics for the environment.

Required parameters	Description
hostname	The name of the VSI used to deploy Delphix.
profile	Compute profile to be used for deploying Delphix (see recommended profiles).
ssh_key	Public SSH key is to be used when provisioning the VSI.
subnet_id	The id of the subnet where the VSI will be provisioned.
volumecount	Number of block storage volumes
volumeprofile	Block storage profile to use (recommended is >= 10 IOPS/GB)
volumesize	Block storage volume size.
vpcname	Name of the VPC where the VSI is provisioned.
zone	VPC zone to provision the environment.

### Downloading the Delphix image

 Contact an account manager to request access to the IBM variant of the Delphix product.

1. Follow the link given by the Delphix solutions architect. Download the **Delphix\_Verson....\_Standard\_IBM.qcow2** file and the **SHA256SUMS** file.
2. Once both files have finished downloading and are in the same directory, run the following command to verify the download:

```
$ grep -i IBM.qcow2 ./SHA256SUMS | sed -E 's,Appliance_Images/
(Controlled_Availability)?, ,g' | sha256sum --check
```

## Uploading the Delphix engine image as an object

1. Authenticate with the IBM Cloud and navigate to the [Dashboard](#)
2. Use the navigation menu to reach the [Resource List page](#). The Resource List page can be navigated from the Dashboard by clicking on **Storage** within the Resource Summary pane.
3. Expand Storage from the menu and select the appropriate resource group. Depending on the organization's strategy for managing IBM resources, [creating a resource group](#) may be required.
4. [Create a storage bucket](#) or select an existing bucket.
5. Click the blue **Upload** button and select **Files**.
6. When the pop-up menu appears, select the **Transfer Type**. Aspera High-Speed Transfer is required for large files, the plugin will need to be installed. It will automatically navigate through the steps to install the plugin.
7. In the **Upload Files** (objects) window, click on the **Select Files** (objects) button and choose the **IBM-specific QCOW2** file that was previously downloaded.
8. Click the **Upload** button.

## Creating a custom image

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)
2. Use the navigation menu to reach the [Custom images page](#) for VPC within the VPC infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Custom images).
3. Click the blue **Create** button.
4. In the **Import Custom Image** page, specify a unique name for the image.
5. From the **Resource Group** drop-down, select the organization's resource group.
6. Optional: In the **Tags** section, provide appropriate [tags](#) to organize resources.
7. Select the appropriate **Region**.
8. Select the **Cloud Object Storage** bucket containing the uploaded image by navigating to **Instances > Location > Bucket** from the drop-down menus. The downloaded **QCOW2** image should appear in the pane below the three drop-down menus.
9. Within the **Operating System** section, click on the **Ubuntu Linux** tile and select **ubuntu-18-04-amd64** from the drop-down menu.
10. Once all the parameters are entered, in the right pane click on the blue button to import custom image.

## Launching the Delphix engine

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)
2. Use the navigation menu to reach the [Virtual server Instances page](#) within the VPC Infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Virtual Server Instances). Note: To maximize performance, deploy the Delphix Engine instance in the same VPC/subnet in which you will create your virtual databases (VDBs).
3. Click the blue **Create** button.
4. In the **New Virtual Server** for VPC page, specify a unique name for the VM.
5. From the **Virtual Private Cloud** drop-down, select the organization's VPC.
6. From the **Resource Group** drop-down, select the organization's resource group.
7. Optional: In the **Tags** section, provide appropriate [tags](#) to organize resources.
8. Select the **Location** of the IBM Cloud resources.
9. In the **Operating System** section, click on the **Select Custom Image** link within the Custom Image block.
10. In the pop menu, select the IBM-specific image previously uploaded.
11. Within the **Profile** section, click on **View** all profiles. Select one of the supported instance types and click **Save**.
12. The **User Data** section can be skipped.

13. The Boot Volume section can be skipped since it would already have the default values.
14. Creating block storage volumes can be done at a later time and will be discussed in the next section.
15. Continue on to the **Network Interfaces** section. If a subnet is already configured in the zone and VPC, then this section will already have a default network interface. Otherwise, create a subnet with the appropriate security groups. If the network is not specified correctly, it is likely that firewall issues will occur. In this case, please consult the organization's IT or DevOps team. If the organization is using Network Security Groups (NSGs), mark the **Use Network Security Groups to Control Traffic** checkbox after consulting the appropriate teams. Last, select the **Do Not Assign a Public IP Address** radio button.
16. Click the **Create virtual server instance** button on the right panel. This will take a couple of minutes.

## Creating block storage volumes

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)
2. Use the navigation menu to reach the [Block Storage Volumes](#) within VPC Infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Block Storage Volumes).
3. Click the blue **Create** button.
4. In the **Block Storage Volume for VPC** modal window, specify a unique name for this Block Volume. It can be helpful if this name is descriptive or identifies the VM it is intended to be attached to and ends in a sequence number.
5. From the **Resource Group** drop-down, select the organization's resource group.
6. Optional: In the **Tags** section, provide appropriate [tags](#) to organize resources.
7. Select the **Location** of the IBM Cloud resources.
8. Enter the required **IOPS**. The recommended supported IOPS is 10/GB.
9. Enter the storage size in GB. Set the size of the volume to be sufficiently large, with room for growth, to support the databases that will be virtualized, or masked, by this Delphix Engine.
10. Keep the **Encryption** settings at default, e.g. Provider Managed.
11. Click the blue **Create Volume** button.
12. Delphix recommends using a minimum total of four disks to run the Delphix Engine. One disk is used for the boot device. The other four equally sized disks will be used for data storage. This also enables the Delphix Engine to achieve higher I/O rates by queuing more I/O operations to its storage. Repeat Steps 3-11 as many times as necessary.

## Attaching block storage volumes

1. Authenticate with IBM Cloud and navigate to the [Dashboard](#)
2. Use the navigation menu to reach the [Block storage volumes](#) within VPC Infrastructure (IBM Cloud pull-down menu > VPC Infrastructure > Block Storage Volumes).
3. From the list of pre-existing **Block Volumes**, identify the volumes attaching to a Delphix Engine and wait until the volume state becomes Available.
4. Note that the volumes being attached have **Attachment Type** set as a hyphen.
5. Select the right side of the volume row menu, then select **Attach to Instance**.
6. In the **Attach Virtual Server Instance** modal window, select the virtual server instance (Delphix Engine) from the drop-down menu.
7. Click on the blue **Attach Volume** button.
8. Repeat Steps 3-7 until all associated **Block Volume** resources have been attached to the Delphix Engine instance.

## Configuring the Delphix engine

1. Connect to the running Delphix Engine instance with a web browser. Use the IP address or DNS name noted in the Instance Description. Upon successful connection, the browser will display a login prompt to enter the **Delphix Setup Page**.
2. Refer to the standard [product deployment instructions](#) to complete the Delphix deployment.

## Next steps

Congratulations! The Delphix Virtualization Engine should be successfully deployed in IBM Cloud.

Use Delphix documentation to learn how to:

- [configure the database source](#)
- [configure target environments](#)
- [create virtual databases \(VDBs\)](#)

## Hotfix information

### Overview

If there are any hotfixes installed for the Delphix Engine, the list can be accessed via the system administrator CLI with the following commands.

```
engine> cd system
engine system> ls
....
hotfixes: [HF-111]
....
```

# Configuration

## Configuration

Once you have deployed Delphix in the infrastructure of your choice, you will need to manage the settings of each Delphix Engine. The configuration section covers everything you need to do and know about Delphix settings and system administration. Each Delphix engine has its own settings, user profiles, policies, and many other configuration parameters. The majority of these are managed per engine, but increasingly will be managed via the Central Managed service. There are also many administrative functions you may need to manage, such as storage and capacity utilization, system monitoring integrations, and Support bundle upload. You may also want to change your engine's configuration, such as adding new storage disks, authentication mechanisms, or network properties.

### Registration management

Each Delphix Engine can be registered via our internal system, typically for association with the Delphix Support team. Learn how to ensure up-to-date registration of your Delphix Engines.

### User and authentication management

There are various user types and configurations to consider when using Delphix. Learn how to set up users, and manage authentication mechanisms such as Single Sign-on and Kerberos.

### Network and DNS management

You may want to manage and configure certain network services, such as DNS, for Delphix. Here we specify general network and connectivity requirements and detail how to test network performance.

### Capacity and resource management

Delphix will be responsible for managing many different data sources and data types. Learn storage and quota best practices, as well as the different options to optimally manage capacity.

### Monitoring and log management

Using both Delphix and its associated datasets will generate many types of logs. Here, we explain the types of logs that Delphix creates as well as the monitoring tool integrations, such as SNMP and Splunk.

### Performance analytics management

Delphix offers various performance analytics tools to help users monitor throughput, latency, and other key metrics. Learn how to leverage these tools and architect your Delphix deployment for optimal performance.

### Starting, stopping, and restarting your engine

Occasionally, you may need to reboot or stop your Delphix engine, here, you will find steps to securely and safely restart your engines.

## Usage data management

The Delphix User-click Analytics feature is a lightweight method to capture how users interact with Delphix product user interfaces. User-click Analytics may also be disabled via the UI.

## Registration management

Registering your Delphix Engines is a prerequisite for serviceability from the Delphix Support team. Registration allows Delphix Support to access the engine and properly diagnose and identify any issues during support cases. It is important to manage your registration regularly in order to ensure the security of Support access, as described in the section below.

Registering a Delphix Engine with support is different from registering it with Data Control Tower, *formerly* Central Management. For more information refer to [Data Control Tower](#)

-  The registration code contains an encrypted key that only Delphix can decrypt, which is unique for each engine. Delphix uses this key to generate one-time authentication codes that authorized Support personnel can use to log into the engine during support sessions.

## Retrieving the Delphix engine registration code

To enable Delphix Support, you may perform registration either during the initial setup of the Delphix Engine. If you want to register later, you may retrieve the registration code from the system setup portal.

1. You can retrieve the Delphix Engine Registration Code during the Initial Setup or later through the Delphix Setup application after logging in as a system administrator.
2. In the Registration panel, click View.
3. The Registration Code is displayed in the bottom half of the Registration window.
4. If your local workstation is connected to the external Internet, you can auto-register the Delphix Engine:
  - a. Enter your Delphix Support Username and Support Password.
  - b. Click Register.
5. If external connectivity is not immediately available, you must register manually.
  - a. Copy the Delphix Engine registration code
  - b. Log in with your support credentials at <https://register.delphix.com>
  - c. Paste the Registration Code and click Register.

Following registration, you will receive an email confirming the registration of your Delphix Engine

## Regenerating the Delphix engine registration code

Delphix recommends that you regenerate the registration code every six months to rotate the secret key in order to maximize the Support Security of the Delphix Engine.

### Procedure

1. Log into the CLI (command-line interface) of the Delphix Engine with the sysadmin credentials.
2. Type `/registration/regenerate` and hit enter.
3. Type `commit` and hit enter. After a few seconds, the new code will be displayed.
4. Re-register the engine with this new code.

Failing to re-register the Delphix Engine after regenerating the registration code may prevent Support personnel from accessing the engine. In such a case, a support session cannot begin until the engine has been re-registered with the new registration code.

## Testing expand addon

### Engines

get\_engines

GET /engines

List all engines.

### Example responses

Response Code: **200**

»» object_name	string	false	read-only	Name of the object affected by the error.

To perform this operation, you must be authenticated by means of one of the following methods: ApiKeyAuth

## User and authentication management

There are two main topics in this section:

- Managing users and groups who will access and manage Delphix.
- Configuring various authentication mechanisms to access both Delphix and connected environments and datasets.

This section covers the following topics:

- [Users and groups](#)
- [Authentication mechanisms](#)

## Users and groups

### User types and user management

There are three user types in the Delphix user model: the system administrator, the Delphix user, and the Self-service user.

Username must start with a letter and contain only alphanumeric characters, hyphens, underscores, and/or periods.

#### System administrators

System administrator users are responsible for managing the Delphix Engine itself, but not the objects (Environments, dSources, VDBs) within the server. For example, a system administrator is responsible for setting the time on the Delphix Engine and its network address, restarting it, creating new system administrator users (but not Delphix users), and other similar tasks.

A user called sysadmin is the default system, administrator user. While this user can be suspended, it may not be deleted. When the Delphix Management application first launches, this user can log in using the username sysadmin and password sysadmin.

To create or modify system administrators, first, log in to Delphix Setup and navigate to the Users section of the homepage. Here, you can:

- **Add new** system administrators with the plus sign
- **Change** system administrator passwords with the pencil icon
- **Delete** system administrators with the trashcan icon
- **Suspend** system administrators with the pause button
- **Reinstate** system administrators with the play button

#### Delphix users

Delphix users are responsible for managing the environments and datasets within Delphix, such as dSources, virtual databases (VDBs), users, groups, and related policies and resources.

A Delphix user can be marked as a Delphix Administrator. Delphix Administrators have three special privileges:

- They can manage other Delphix users
- They implicitly have Owner privileges for all Delphix objects
- They can create new groups and new environments

The default Delphix user provided with a Delphix Engine is a Delphix Administrator and is called admin. Like the sysadmin user, the admin cannot be deleted. When the Delphix Management application launches, the admin user can log in using the password specified during the initial setup when Delphix was first launched.

Only these two users require password-based authentication. Also, other users may use other mechanisms such as LDAP or Kerberos, as described in [Configuring and managing kerberos](#) and [Configuring and using LDAP with the Delphix Engine](#).

#### Self-service users

Delphix Self-Service has two types of users: the admin user and the data user.

**Admin users** have full access to all report data and can configure Delphix Self-Service, additionally, they can:

- Use the Delphix Engine to add/delete users

- Change tunable settings
- Add/delete tags
- Create and assign data templates and containers

**Data users** have access to production data provided in a data container. The data container provides these users with a playground in which to work with data using the Self-Service Toolbar.

For more information on Self-service users, visit our [Self-service documentation](#).

### User privileges for Delphix objects

The user roles on Delphix objects consist of four types, which the Engine Admin user assigns: Provisioner, Owner, Data Operator, and Reader. These privileges apply both to objects, such as dSources and Virtual Databases (VDBs), and to groups, which are containers that hold those objects.

The Delphix Administrator user can assign privileges to groups, dSources, and VDBs. Privileges are inherited, meaning that privileges assigned to a group are effective for the dSources and VDBs contained in that group.

If a user does not have a privilege in relation to an object or group, then he or she has no visibility into that object or group.

### Roles and Privileges for Delphix Objects

Role	Object privileges	Group privileges
Owner	<ul style="list-style-type: none"> <li>• Can provision VDBs from owned dSources and VDBs</li> <li>• Can perform Virtual to Physical (V2P) from owned dSources and VDBs</li> <li>• Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption</li> <li>• Can refresh or rollback VDBs</li> <li>• Can snapshot dSources and VDBs</li> <li>• Can start, stop, or re-start VDBs</li> </ul>	<ul style="list-style-type: none"> <li>• Can provision VDBs from all dSources and VDBs in the group</li> <li>• Can refresh or rollback all VDBs in the group</li> <li>• Can snapshot all dSources and VDBs in the group</li> <li>• Can perform Virtual to Physical (V2P) from owned dSources and VDBs</li> <li>• Can view Templates for policies.</li> <li>• Can not create, edit, or delete a policy template from the policy page.</li> <li>• Can assign Owner privileges for dSources and VDBs</li> <li>• Can access the same statistics as a Provisioner, Data Operator, or Reader</li> <li>• Can start, stop, or re-start VDBs</li> </ul>
Provisioner	<ul style="list-style-type: none"> <li>• Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption</li> <li>• Can provision VDBs from dSources and VDBs</li> </ul>	<ul style="list-style-type: none"> <li>• Can access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption</li> <li>• Can provision VDBs from all dSources and VDBs in the group</li> </ul>

Role	Object privileges	Group privileges
Data Operator	<ul style="list-style-type: none"> <li>• Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption</li> <li>• Can refresh or rollback VDBs</li> <li>• Can snapshot dSources and VDBs</li> </ul>	<ul style="list-style-type: none"> <li>• Can access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption</li> <li>• Can refresh or rollback all VDBs in the group</li> <li>• Can snapshot all dSources and VDBs in the group</li> </ul>
Reader	<ul style="list-style-type: none"> <li>• Can access statistics on the dSource, VDB, or snapshot such as usage, history, and space consumption</li> </ul>	<ul style="list-style-type: none"> <li>• Can access statistics on all dSources, VDBs, or snapshots in the group such as usage, history, and space consumption</li> </ul>
Self-Service Only	<ul style="list-style-type: none"> <li>• In the Delphix Self Service UI this user can: <ul style="list-style-type: none"> <li>• Refresh</li> <li>• Restore</li> <li>• Bookmark</li> <li>• Reset</li> <li>• Branch</li> <li>• Stop/Activate</li> <li>• Share</li> </ul> </li> </ul>	

## Managing groups

Creating groups helps you manage policies and privileges over objects within that group. When privileges are created for users at the group level, those privileges apply to all objects of that type within the group. When new objects are created or added to the group, the policies and privileges you have created at the group level will be applied to them.

- [Assigning group and object ownership](#)
- [Adding and deleting groups](#)

## Authentication mechanisms

Delphix supports a variety of authentication mechanisms to connect to several different interfaces and systems. For example, you can connect via the UI using the default users described above, or you can connect to the CLI using an API token.

There are three categories of authentication related to Delphix: the Delphix UI, the Delphix CLI/API, and external systems such as Kerberos access to connected source and target hosts. Below are detailed pages related to each of these three sections:

- UI authentication:
  - Data Control Tower, formerly Central Management
  - Username and password
  - LDAP: Directory-based authentication to Delphix engines rather than the default local access
  - Single Sign-on: Integration and support for identity providers to authenticate users on a per engine basis using SAML2-SSO.
- CLI authentication:

- Username and password
- Auto-authentication via SSH keys: to automatically sign in to the Delphix CLI without requiring user-input credentials
- API authentication
  - Username and password
  - API Tokens (for Delphix Engines registered with [Data control tower](#))
  - OAuth2 JSON Web Tokens
- External systems:
  - Username and password
  - SSH keys
  - Kerberos: Authentication for environments and data sources using Kerberos

### **Kerberos support**

Kerberos support is for access to connected environments, rather than the Delphix engine itself. This is an advanced topic and will require a solid understanding of Delphix concepts and architecture.

## Assigning group and object ownership

This topic describes how to assign group and object ownership to users in the Delphix Domain.

1. Log into the **Delphix Management** application.
2. Select **Manage > Users**.
3. For an existing user, select a user then select the edit icon.
4. Click **Next**.
5. In the **Privileges** tab assign **Owner** or **Provisioner** rights for groups or objects within groups. You do not have to assign a specific owner or auditor right for each object.
6. Click Next when finished.
7. For new users, refer to [Users and Groups](#). When you click **Submit**, the User Profile manager will reload, and then you can follow steps 4 - 6 to assign privileges.

## Adding and deleting groups

This topic describes how to add and delete groups within the Delphix Domain.

### User terminology for Delphix admin has been changed to engine admin.

The default domain user created on Delphix Engines is now **admin** instead of `delphix_admin`. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling `delphix_admin`.

### Adding a group

1. Log into the **Delphix Management** application.
2. From the **Manage** menu, select **Datasets**.
3. Select the **plus** icon and then select **Add Dataset Group**.
4. Enter a **Group Name** and an optional description.
5. Click **Add**.

### At least one group must exist

At least one group must always exist on the Delphix Engine in order to link a dSource. If you delete the last group, you will need to create a new group in order to create a dSource.

### Deleting a group

1. Log into the **Delphix Management** application as a user with **Engine Admin** privileges or group **OWNER** privileges for the target group.
2. From the **Datasets** panel, select the target group.
3. Click the **Trash Can** icon.
4. Click **Delete**.

### Deleting groups containing objects

A group cannot be deleted if it contains VDBs or dSources. All databases within a group must be deleted prior to deleting the group.

## Managing system administrators

### Adding a new system administrator

1. Launch the **Setup** application.
2. From the **Dashboard** select the **+** icon located in the **Users** card next to the filter field.

Users <span>ⓘ</span>	
	+ ▶ ✎ 🗑
Username	Email
sysadmin	manisha.gupta@delphix.com

3. Enter the required information.

### Add User ✕

#### Authentication Type

##### Confirm Password

...

##### Email Address

#### USER DETAILS

**First Name**

**Last Name**

**Phone (Work)**

**Phone (Cell)**

**Phone (Home)**

Cancel

Save

4. Click **Save**.

#### Deleting and suspending system administrators

1. Launch the **Delphix Setup** application and log in using the **sysadmin** (or another system administrator) credentials.
2. In the **User** panel, click the user you want to suspend or delete.
3. Suspend the user by clicking the **pause** icon.

4. Once the user has been paused you can delete the user by clicking the **trash can**.

5. From the Delete User dialog select **Delete**.

**i Suspend the sysadmin user**

The sysadmin user is a required user for the Delphix Engine. This user cannot be deleted but can be suspended. Suspending the sysadmin user prevents that user from being able to log into **Delphix Setup** or to the console via **ssh**.

Reinstating system administrators

1. Launch the **Delphix Setup** application and login using system administrator credentials.
2. In the **User** panel, click on the name of the user you want to reinstate.
3. Reinstatement the user by clicking the **enable user** icon (  ).

## Changing system administrator passwords

1. Launch the **Delphix Setup** application and log in using **sysadmin** level credentials.
2. In the **User** panel, click the user whose password you want to change.

The screenshot shows the Delphix Admin interface. At the top, there is a navigation bar with 'Environments', 'Monitor', 'Settings', 'Admin', and 'Audit'. Below this, the breadcrumb 'Home > Admin > Users' is visible. The main heading is 'Admin' with a sub-heading 'Users'. There are two buttons: 'Add User' and 'Generate New Key'. A table lists users with columns for 'User', 'Last Name', 'First Name', 'Email', 'Type', 'Edit', and 'Delete'. The 'admin' user is highlighted, and the 'Delete' icon is circled in blue. A sidebar on the left contains links for 'Users', 'Email Notification', 'Utilization', 'Logs', and 'About'. The footer includes a breadcrumb 'Environments | Monitor | Settings | Admin | Audit' and the 'DELPHIX' logo.

User	Last Name	First Name	Email	Type	Edit	Delete
admin			manisha.gupta@delp...	Administrator		

3. Select the **Edit** icon.
4. Enter the new password fields.

## Edit User

First Name	Last Name
<input type="text"/>	<input type="text"/>
User Name	Email
<input type="text" value="admin"/>	<input type="text" value="abcd@delphix.com"/>
Change Password	<input checked="" type="checkbox"/>
Password	Confirm Password
<input type="text"/>	<input type="text"/>
Administrator	<input checked="" type="checkbox"/>
Enable Welcome Page	<input checked="" type="checkbox"/>
Enable Notification Popup	<input type="checkbox"/>
Account Status	<input style="border: 1px solid #ccc; width: 100px; text-align: center; font-size: small; color: #666; background-color: #f9f9f9; border-radius: 3px; padding: 2px 5px; vertical-align: middle;" type="text" value="Active"/> ▼

5. Click **Save**.

Adjust session timeout (command-line only)

Configuring session timeout for System Setup users is not available in the GUI. As such, the only method is via CLI using the commands below.

```
Delphix> user
Delphix user> select sysadmin
Delphix user 'sysadmin'> ls
Properties
  type: User
  name: sysadmin
  apiUser: true
  authenticationType: NATIVE
  emailAddress: user.name@domain.com
  enabled: true
  firstName: (unset)
  homePhoneNumber: (unset)
```

```
isDefault: true
lastName: (unset)
locale: en-US
mobilePhoneNumber: (unset)
passwordUpdateRequest: NONE
principal: sysadmin
publicKey: (empty)
reference: USER-1
sessionTimeout: 30min
userType: SYSTEM
workPhoneNumber: (unset)
```

#### Operations

delete

update

disable

enable

updateCredential

```
Delphix user 'sysadmin'> update
```

```
Delphix user 'sysadmin' update *> set sessionTimeout=180
```

```
Delphix user 'sysadmin' update *> commit
```

## Managing Delphix users

This section describes how to manage users. Here, you can learn how to:

- [Add Users](#)
- [Edit, Delete and Suspend Users](#)
- [Manage Profile Information](#)
- [Delphix User Account Lockouts](#)

### Adding users

#### Prerequisites

If you intend to validate user logins using LDAP authentication, make sure a system administrator has configured LDAP.

#### Procedure

1. Launch the **Delphix Management** application.
2. Click **Manage**.
3. Select **Users**.
4. Click plus icon to **Add User**.
5. Enter the mandatory fields **Username**, **Email Address**, and **New Password** for the new user.

#### Note:

Rules for creating a username

Your username:

- must be between 1 to 256 characters
- can be just letters, just numbers, or just any of the following special characters ( \_ , - , . , @ ) or a combination of all of these. For example, a username could be just "@".
- can start with any of the above-listed characters and is case-sensitive.

Your password has no restrictions..

6. Select the **User Type**.
7. Click **Next**.
8. In the **Privileges** tab enter the privileges for the user.
9. Click **Next** and review the summary.
10. Click **Submit**.

#### **Assigning owner and provisioner privileges**

Assigning owner privileges at the group level conveys ownership privileges over all objects in that group.

Click the **expand** icon next to each group name to see all objects in that group.

You can also assign ownership privileges only for specific objects in a group. You do not have to assign owner or auditor privileges for all Delphix objects, only those for which you want to grant the user-specific access.

### Editing, deleting, and suspending users

#### **The delphix\_admin user**

The user named **delphix\_admin** cannot be deleted since this is a user created by the Delphix Engine.

However, you can suspend it.

 When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling delphix\_admin.

1. Launch the **Delphix Management** application.
2. Select **Manage > Users**.
3. Click the user's name to open the user's profile panel.
4. Click the **disable** icon to disable the user.
5. Click the **trash can** icon to delete the user.

 Deleting a user cannot be undone.

### Managing individual profile information

1. After logging in, click your name in the menu bar.
2. Click **Profile**.
3. Edit profile information as necessary.
4. Select options for the event level that will trigger a notification email.
5. Select a time period for **Session Timeout**.
6. Click **Password** to edit your password.
7. Click **OK** when finished.
8. Click **Privileges** to see your privileges (Auditor or Owner) for Delphix objects.

### Delphix user account lockouts

#### User account lockouts

This feature applies to all kinds of users -- Delphix and LDAP. It also applies to usernames that do not correspond to any user in the system. A user who enters a wrong password three times in a row is "locked out" (i.e., unable to continue attempting to log in) for an initial period of 30 seconds. After three more bad login attempts, the user must wait 60 seconds, then 90 seconds, and so on.

#### Troubleshooting a user account lockout

The initial wait time for any future lockouts is reset to 30 seconds when the user successfully logs in or when an administrator resets the user's password. When an administrator resets a locked-out user's password, the user can immediately attempt to log in.

## Managing individual profile information

This topic describes how individual users can manage personal settings such as personal information, passwords, event notifications, and session timeouts. It also describes how users can view their privileges for Delphix objects.

### Procedure

1. After logging in, click your name in the menu bar.
2. Click **Profile**.
3. Edit profile information as necessary.
4. Select options for the event level that will trigger a notification email.
5. Select a time period for **Session Timeout**.
6. Click **Password** to edit your password.
7. Click **OK** when finished.
8. Click **Privileges** to see your privileges (Auditor or Owner) for Delphix objects.

## Authentication mechanisms

There are various authentication mechanisms that Delphix supports besides signing in via username and password to engines via the GUI, CLI or API. Below, you'll find documentation for the following capabilities:

- Auto-authentication via SSH keys: to automatically sign in to the Delphix CLI without requiring user-input credentials
- LDAP: Directory-based authentication to Delphix engines rather than the default local access.
- Single Sign-on: Integration and support for identity providers to authenticate users.
- Kerberos: Authentication for environments and data sources using Kerberos.
- OAuth2: Offers an alternative, password-less authentication method for API access to the Delphix Engine.

### **Kerberos support**

Kerberos support is for access to connected environments, rather than the Delphix Engine itself. This is an advanced topic and will require a solid understanding of Delphix concepts and architecture.

## How to setup auto-authentication

Generally, users need to enter a username and password when logging into the Delphix CLI. There are situations in which users may find entering a password cumbersome, or manual password entry may not be possible. These situations can be alleviated by setting up auto-authentication for the Delphix CLI.

There are two basic steps:

1. Generate a public and Private RSA key pair.
2. Register the public key with the specific Delphix Engine user.

There are two methods available:

- PuTTY
- OpenSSH with OpenSSL

If the examples provided do not work for you, you may need to consult your SSH documentation, we can only provide support for the Delphix Engine side of the connection. In both examples we grant password less login to the **sysadmin** user to host **Delphix5010**.

Using PuTTY

You will need both **putty.exe** and **puttygen.exe** for this.

Launch **puttygen.exe**

Set the **Type of key to generate** to *SSH-2 RSA* and the **Number of bites in generated key** to a suitable value such as *2048*. Click **Generate**

Once it has generated the key pair, leave the password fields blank and save the public and private keys to file.

Add the full contents of the public key to each Delphix Engine user you want to allow automatic login for.

```
Delphix5010> user Delphix5010 user> select sysadmin Delphix5010
user 'sysadmin'> update Delphix5010 user 'sysadmin' update> set
publicKey="ssh-rsa
AAAAB3NzaC1yc2EAAAABJQAAAQEAjdQYr1WU6UPr6FZqyt3eKNJEkAe8IdkQ8hcuBwa3HvRVmUuv0L
ykm5AYQlIW0B33aWusr0o+2FVTzt3/6G1LLCf7wfhCShlJsYgwgMHeEGjixK5tacFCD8r+8dALaXlv
8u0lddK0A2LPXbCCCIRL7IyVENlSbUFY8s+E/
2R3owy5XSbLJLE1eL5m1lQP0yUuQddAh25ruWR+1HHSaWG3p+wof0h6l7czkEcq7fPjtAZvivX90e8
Ggt6JQ8bv6td7aJW0bU2Y9YY0HLLHot7NQ4AT/
0tXSRKAG8sIdL7tY9hbHMNRftCLzfn7mL+Qk8TjUYni3JGB4Vyi0bmkj6nHQ== rsa-
key-20160309" Delphix5010 user 'sysadmin' update> commit
```

1. In Putty, create a profile that uses the private key. In the PuTTY Connection settings set **SSH > Auth > Private key file for authentication** to the private key file you just generated
2. Next, still in the PuTTY Connection settings set **Data > Auto-login username** to `sysadmin@SYSTEM`.
3. Test the connection by setting the connection hostname as you normally would for PuTTY and click **Open**.

```
Connection > SSH . Auth
```

## Using OpenSSH with open SSL

Generally, OpenSSH will already have default public and private keys that can be used, if not (or the default keys are password locked) you can create them this way. OpenSSH is required but OpenSSH will take care of the background OpenSSL stuff for you.

1. Create your RSA key pair to a bit length suitable for your security needs (2048 is commonly required for recent security audits)

```
$ ssh-keygen -b 2048 -t rsa -P ' ' -f /etc/ssh/ssh_host_rsa_key
```

Results in a matching public file called `/etc/ssh/ssh_host_rsa_key.pub` If you want to create different key pairs, just specify a different file path.

2. Add the full contents of the public key (`/etc/ssh/ssh_host_rsa_key.pub` in this example) to each Delphix Engine user you want to allow automatic login for.

```
Delphix5010> user Delphix5010 user> select sysadmin Delphix5010
user 'sysadmin'> update Delphix5010 user 'sysadmin' update> set
publicKey="ssh-rsa
AAAAB3NzaC1yc2EAAAABJQAAAQEAjdQYr1WU6UPr6FZqyt3eKNJEkAe8IdkQ8hcuBwa3HvRVmUuv0L
ykm5AYQlIW0B33aWusr0o+2FVTzt3/6G1lLCf7wfhCShlJsYgwgMHeEGjixK5tacFCD8r+8dALaXlv
8u0lddK0A2LPXbCCCIRL7IyVENlSbUFY8s+E/
2R3owy5XSbLJLE1e15m1lQP0yUuQddAh25ruWR+1HHSaWG3p+wof0h6l7czkEcq7fPjtAZvivX90e8
Ggt6JQ8bv6td7aJW0bU2Y9YY0HLLHot7NQ4AT/
0tXSRKAG8sIdL7tY9hbHMNRftCLzfn7mL+Qk8TjUYni3JGB4Vyi0bmkj6nHQ== rsa-
key-20160309" Delphix5010 user 'sysadmin' update> commit
```

3. Test no password login on the command line from your client.

```
$ ssh -i /etc/ssh/ssh_host_rsa_key sysadmin@Delphix5010
```

## Configuring and using LDAP with the Delphix engine

Using LDAP with the Delphix Engine requires the following:

- configure the Delphix Engine to use LDAP
- add LDAP users in the Delphix Management application

Configuring LDAP on the Delphix engine

1. From the Delphix Setup application configure the LDAP server with the Delphix Engine by selecting Modify in the Authentication section.

2. Enter the information about the LDAP Authentication Server. This must be an LDAP server that is configured for authentication. This information should come from the LDAP admin who runs the server. As a general rule only use simple auth. If using SSL/TLS typically use port 636 and import a certificate. If not using SSL/TLS, use port 389 and you will not need a certificate. If the remote LDAP server has disabled anonymous access and the user is trying to use SSL/TLS, the user will be unable to import the certificate. If this occurs file a support case so that Delphix Support can help manually upload the certificate.

**Note:**

Import Server certificate option may import more than one certificate. It is recommended to import the CA certificate in the TrustStore and then click the Test Connection option to validate. For more information on adding a certificate in the TrustStore, refer to [TrustStore Settings](#).

Test Connect will issue an anonymous login request to the LDAP server. If the LDAP server has disabled anonymous access the test will fail. Test the server by adding a valid LDAP user and try logging in.

3. After updating the information and clicking the **Save** button, the *Authentication Service* section should reflect the proper information.

Create a new LDAP user account

1. Login to the Delphix Management application and go to **Manage > Users** to add a new user.

2. In the **Users** screen, click the **Add User** icon (  ) and choose **LDAP** as the *Authentication Type*.

Add User

3. Fill out the data fields and decide if the user will be a *Delphix Admin*. For more info on the *Delphix Admin* setting please see [Managing System Administrators](#). When adding the principal, it is mandatory to specify the entire DN of the user to be added.

Each entry in an LDAP tree has a unique identifier; its Distinguished Name (DN). This consists of its Relative Distinguished Name (RDN), constructed from some attribute(s) in the entry, follow the parent entry's DN. Think of the DN as the full file path and the RDN as its relative filename in its parent folder (e.g. if /foo/bar/myfile.txt is the DN then myfile.txt would be the RDN). Some users prefer to use the term fully qualified DN to emphasize that a proper DN should include all of the components.

Example of LDAP tree in which the base is:

dc=example,dc=com

and people are stored in a People subtree with RDN:

ou=people

and each individual is keyed by the cn (common name) attribute.

An example DN in this case would be: cn=Tony,ou=people,dc=example,dc=com

When adding an LDAP user you will be asked for the following information:

- Principal - which is the DN from above
- email address
- username - used to login into Delphix

A password is no longer required because it will authenticate against the password already stored in the LDAP entry, which is presumably known to the individual already. It is probably best if someone familiar with the LDAP tree and using it for authentication were involved at least initially to help understand how to describe the fully qualified DN for users.

Using Microsoft AD as an LDAP server

Using Microsoft AD as a modified LDAP server is also possible. Microsoft AD allows some shortcuts in the specification of the DN when binding.

Examples:

- <domain>\<user logon name>
- <user logon name>@<domain>.com

As with generic LDAP, it is probably best if someone familiar with using the AD LDAP instance for authentication was involved.

## User

### User Type

Standard User

### Authentication Type

LDAP

## CREDENTIALS

### Principal

delphix\jwatson

### Username

jwatson

### Email Address

john.watson@delphix.com

When users log in, they will enter the username as chosen above, and the password that matches the principal entered above.

## Configuring single sign-on

### Overview

This article provides instructions on how to set up Single Sign-on (SSO) on the 5.3.3+ Delphix Engine. Delphix Engines (Masking and Virtualization) versions 5.3.3+ support authentication via the SAML 2.0 standard (SP initiated and Idp Initiated). SLO (Single log-out) is not supported. This means that logging out of a Delphix Engine will not terminate sessions on other Delphix Engines, nor will it terminate the IDP session.

### Identity provider configuration

The steps to configure an Identity Provider (IdP) are specific to each IdP product (e.g. Okta, OneLogin, PingFederate). The terminology may vary, but one SAML 2.0 application (or SP connection) will need to be created for each Delphix Engine. The engine does not expose a metadata document. The following attributes must be entered:

- ACS URL (Assertion Consumer Service URL): `http(s)://<delphix-engine>/sso/response`
  - Delphix strongly recommends that HTTPS is used instead of HTTP for all UI and API communication with the Delphix Engine. For HTTPS or the automatic HTTP to HTTPS redirect, use the **https://** scheme in the ACS URL, otherwise use the **http://** scheme. Refer to the [CLI Cookbook: Changing HTTP and HTTPS Web Connections](#) article on how to set up HTTPS.
- SAML Bindings: Delphix Engines support the POST and Redirect bindings.
- Audience Restriction (SP entity ID, Partner's Entity ID): The audience restriction must be set to the entity id configured in the Delphix Server via the Delphix Setup (see below). The default value is **https://<Delphix Server ID>** where <Delphix Server ID> is a 36-character hexadecimal string of the form `xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx`. See [Determining the Delphix Server ID and Host Name](#) for more on the Delphix Server ID.
  - If the Delphix Engine does not exist or is unreachable, enter a temporary value (such as `delphix-sp-id`) to later be replaced by the actual Delphix Server ID.
- Signature policy: The Delphix Engine does not sign authentication requests; it requires that either the responses, assertions, or both are signed.
- Name ID: The SAML NameID attribute must be set to the email address of the user. See the *User Management When SSO is Enabled* section below. for more information.

The SP initiated flow must be enabled in the IDP.

### New engine configuration

Follow this procedure when installing a new Delphix Engine.

1. Connect to the Delphix Engine at `http://<DelphixEngine>/login/index.html#serverSetup`. The **Delphix Setup** application will launch when connecting to the server.
2. Enter the **sysadmin** login credentials; this account has a default username of **sysadmin** and password of **sysadmin**.
3. In the Authentication step of the Delphix Setup wizard, check the **use SAML/SSO** box and enter the required information:
  - a. The entity id is a unique identifier of the Delphix Engine for Single Sign-On providers. The default value is **https://<Delphix Server ID>**, where <Delphix Server ID> is a 36-character hexadecimal string of the form `xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx`. This is just an identifier; there is no resource at that URL. This value can be changed to any string, but note that some identify providers require this to have a URL format.
  - b. The IdP metadata is an XML document that must be exported from the application created in the IdP (see [Identity Provider Configuration](#)).
  - c. Optional **Advanced** settings include the **response skew time** which is the maximum time difference allowed between a SAML response and the engine's current time, in seconds. If not set, it defaults to

- 120 seconds. The **maximum age of IdP authentication** indicates how far in the past to accept authentications to the identity provider, in seconds. If not set, it defaults to 86,400 seconds (one day).
4. Complete the remaining setup steps as usual.

#### Existing engine configuration

Follow this procedure to enable SSO on an already configured engine.

1. Connect to the Delphix Engine at `http://>>` . The **Delphix Setup** application will launch once connected to the server.
2. Enter the **sysadmin** login credentials.
3. In the **Authentication** tile, select **Modify**.

4. In the Authentication dialog, check the use SAML/SSO box, then enter the entity id (if not using the default), IdP metadata, and the optional advanced time settings (described in [New Engine Configuration](#)).

## Engine type

If this is an upgraded engine, make sure the engine type is set from the banner of the ServerSetup application dashboard.

### User management when SSO is enabled

Access to the Delphix Setup application is not affected by the use of SSO, it only affects access to the Delphix Management Application and Masking Application. When SSO is enabled, authentication to the Delphix Management Application or Masking Application UIs are performed via SAML/SSO instead of a combination of username and password. Non-administrators can no longer change their email address.

An administrator must create a Delphix user for each user to whom access via SSO must be granted. The Delphix user can be used to assign roles and permissions. The email address of the Delphix user is used to match users authenticated via SAML/SSO and must be set to the exact value defined in the IdP. This same value is used in the NameID attribute of the SAML response. Supported NameID formats

are `urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified` and `urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress`.

If multiple Delphix users share an email address, all Delphix users will have access to the SAML/SSO session.

Once SSO is enabled, usernames and passwords (LDAP or locally stored) still need to be used for API access, and newly created user will have API access disabled by default.

### API access

Neither the API access for use in scripts and integrations nor the Virtualization CLI access requires SSO. Instead, username and password (optionally with LDAP integration) authentication must be used for API or CLI access. When SSO is enabled on a Delphix Engine, new users by default will have no API access and no password. Administrators can enable API access for any user through the User Management or Masking UIs. The user's password or LDAP credentials are used for API authentication.

Users created before enabling SSO will maintain their API access enabled. Users with API access but no email address are useful for scripts or integration via the API - they cannot be used to log in via the UI. When SSO is enabled, only administrators can change or set email addresses.

A user with API access may also log in via SAML into an SSO-enabled engine through the UI when they have an email set.

### Troubleshooting

If authentication via SSO fails with a message stating that the issue time is either too old or in the future, the error is due to the time on the Delphix Engine not being in sync with the time of the Identity provider server. If the time on the Delphix Engine is not correct, correct the time settings manually or configure NTP. Alternatively, update the response skew time parameter (see [Existing Engine Configuration](#)).

If authentication via SSO fails with a message stating that the authentication to the identity provider is too old, re-authenticate with the identity provider or adjust the maximum age parameter (see [Existing Engine Configuration](#)).

## Configuring and managing kerberos

**i** **Version 6.0.7.0 or later recommended for kerberos**

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge base](#) article.

This section covers the following topics :

- [Delphix kerberos implementation](#)
- [SSH implementation](#)
- [Kerberos requirements](#)
- [Configuring kerberos](#)

## Delphix kerberos implementation

### **Version 6.0.7.0 or later recommended for Kerberos**

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#) article

## Shared infrastructure/ticket management

The Delphix Engine (DE) has a single Kerberos principal shared between all connections to the host (SSH, ASE JDBC, etc).

## Overview of the authentication process

1. The client acquires a ticket from the Kerberos Domain Controller (KDC) (e.g. `kinit <principal>`) which it stores locally.
2. The client uses a ticket from KDC to authenticate with the target (e.g., ssh- or JDBC authentication using `gssapi` to pass the cached ticket acquired in step 1).

## Kerberos master/replica KDCs

Kerberos supports a master/replica system with multiple KDCs running on different hosts. This is used for High Availability (HA) or to provide faster service via a local node in dispersed network environments. Delphix supports a list of KDCs for the Kerberos realm to which it has been joined.

## Delphix infrastructure to support the authentication process

### Kerberized environment user

Delphix has introduced a `KerberosCredential` type that indicates the global Kerberos principal to be used for authentication, rather than user-specific credentials.

### Keytab based authentication

It is possible to use `kinit` with a keytab file instead of password-based authentication to acquire tickets. This is similar in principle to passwordless SSH authentication and allows Delphix to function in the customer's environment without storing any passwords on the Delphix Engine. It does, however, put us at the mercy of the customer's keytab expiration policy.

The Delphix Engine creates a background thread that periodically checks the expiration of the cached Kerberos credentials. If the credentials have expired, it calls `kinit` using the keytab that was provided.

### Keytab file storage

Keytab file data is sent via a web service API as a Base64 encoded string. This is then decoded back to the binary file and persisted on local storage on the Delphix Engine with root user ownership permissions.

#### Default behavior

Default Kerberos ticket refresh configuration:

- Delphix checks if the TGT-cached Kerberos ticket should be refreshed every hour.
- The TGT-cached ticket for the global Delphix principal will be refreshed if it expires in less than two hours. The default values can be changed by Delphix Support.

### SSH implementation

The management stack uses sshj+gssapi to pass already-generated Kerberos tickets to the Kerberized sshd on the source/target side if prompted to do so by the end-user passing a Kerberized environment user to existing wrapper functions.

**[-]** The only thing changing from password-based or regular passwordless SSH authentication is the authentication step. Command execution remains unchanged.

### SAP ASE, Oracle, and DB2 connections

Delphix connects to SAP ASE, Oracle, and DB2 instances using the two listed mechanisms below. This example configuration uses an SAP ASE instance.

- via isql process
- via the jConnect JDBC driver

When connecting via isql Delphix uses the “-V” parameter rather than specifying a username/password. The “-V” option uses the Kerberos principal in the current user’s cached credentials file. Delphix relies on the end customer to configure this appropriately for their environment (for example, the cached credentials could be populated by a PAM module during login). Delphix also expects that the `KRB5CCNAME` is set appropriately or the credential cache is in the host default location.

When connecting via JDBC, Delphix uses additional connection options:

`REQUEST_KERBEROS_SESSION=true&SERVICE_PRINCIPAL_NAME=` . By default, the instance Service Principal Name (SPN) is identical to the instance name for authentication. Delphix allows the instance SPN to be manually set on a per-repository basis to allow for non-default values. The jConnect JDBC driver connects using the cached credentials that were obtained as described in the Shared infrastructure/Ticket Management section.

For example, if the instance name is `ASE_INSTANCE_1` and has been configured to use `REALM.COM` , then the instance will attempt to authenticate with the KDC using `ASE_INSTANCE_1@REALM.COM` . However, this is configurable and can be specified either via an environment variable or a command-line option to the data server process. If an environment variable is used to configure the SPN, the instance must be manually discovered via web service APIs or the Delphix CLI.

## Kerberos requirements

### Prerequisites

Basic requirements prior to the configuration:

- MIT Kerberos 1.4.4 KDC
- Kerberos `REALM` name
- Global Kerberos principal name (specified without trailing `@REALM` name)
- Global Kerberos principal `keytab` data encoded as a base 64 string
- KDC hostnames and port numbers (one or more in priority list order)

### Environment requirements

#### **i** Version 6.0.7.0 or later recommended for Kerberos

Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#) article.

The following hosts and software versions are required:

- A source host with the following configuration:
  - A running SAP ASE, Oracle, or DB2 instance.
  - A database to link from and its corresponding full database dump.
  - The Delphix principal is able to access the SAP ASE instance and SSH onto the host as per our product documentation (see [Requirements for SAP ASE](#)).
  - The credential cache for the Delphix principal is populated and kept current. The environment variable `KRB5CCNAME` is set to the location for a credential cache. Login to the Adaptive Server via `" isql_r64 -V -R>><> "` or `" isql_r -V -R>><> "` or otherwise make sure that `" isql "` points to either `" isql_r64 or isql_r "` so that `" isql -V -R>><> "` works.
- A staging host with the following configuration:
  - A running SAP ASE, Oracle, or DB2 instance with the same version as the source instance.
  - The Delphix principal is able to access the SAP ASE instance and SSH onto the host as per our product documentation (see [Requirements for SAP ASE](#) ).
  - The credential cache for the Delphix principal is populated and kept current. The environment variable `KRB5CCNAME` is set to the location for a credential cache. Login to the Adaptive Server via `" isql_r64 -V -R>><> "` or `" isql_r -V -R>><> "` or otherwise make sure that `" isql "` points to either `" isql_r64 or isql_r "` so that `" isql -V -R>><> "` works.
- A target host to create a VDB on. Configuration details:
  - A running SAP ASE, Oracle, or DB2 instance with the same version as the source instance.
  - The Delphix principal is able to access the SAP ASE instance and SSH onto the host as per our product documentation (see [Requirements for SAP ASE](#) ).
  - The credential cache for the Delphix principal is populated and kept current. The environment variable `KRB5CCNAME` is set to the location for a credential cache. Login to the Adaptive Server via `" isql_r64 -V -R>><> "` or `" isql_r -V -R>><> "` or otherwise make sure that `" isql "` points to either `" isql_r64 or isql_r "` so that `" isql -V -R>><> "` works.

## Supported databases and Kerberos configurations

For detailed Kerberos support please refer to [Kerberos Support Matrix](#)

Delphix Engine 5.3.2.0 is the first generally available customer release to support Kerberos on a subset of supported OS' with SAP ASE, Oracle, and DB2 databases.

- With the Delphix Engine 5.3.2.0 release, many of the previously unsupported GUI functions now function when Kerberos is enabled. See [Configuring Kerberos via the UI](#) below for details, including limitations.

## Configuring Kerberos

This section covers the following topics:

- [Configuring Kerberos during Engine Setup](#)
- [Add a Kerberos Environment](#)
- [Adding and Linking a dSource](#)

Configuring Kerberos during engine setup

**Version 6.0.7.0 or later recommended for Kerberos**  
 Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#) article.

For using the kerberos authentication along with another authentication,

1. In the **Virtualization Setup** wizard, Click **Next** on the **Welcome** screen.
2. Complete the following tabs as you normally would.
3. In the **Network Authorization** tab, select the **Use Kerberos authentication to communicate with the remote hosts** checkbox.
4. Provide values in the following fields:
  - **Realm**
  - **Principal**
  - In the **Keytab** field, enter the key in a base64 encoded format.

**Note:**  
 You must provide the key must in a single line. For example, you can use the following command to view the base64 representation of the Keytab key.

```
echo "$(base64 --wrap=0 <keytab>)"
```

5. Then select **Next**.

6. Confirm your selections and select **Submit**.

Editing Kerberos configuration settings

To edit your configuration settings after setup, login as a sysadmin user and complete the following steps:

1. On the Delphix SETUP Dashboard, from the **Network Authorization** panel, click **Modify**.

2. Select the check box under KERBEROS CONFIGURATION, select the hostname and edit the configuration.

## Network Authorization ✕

---

**KERBEROS CONFIGURATION**

Use Kerberos authentication to communicate with remote hosts

**Kerberos Key Distribution Center host(s)**

+ 🗑️

Hostname	Port
kerberos-02.delphix.com	88

**Principal**

**Keytab**

\*\*\*\*\*

**HOST CONNECTION AUTHENTICATION**

When connecting to hosts, you can provide username-password pairs when setting up the connection, or you can utilize one or more Enterprise Password Vault systems by adding them to your engine setup.

Click the + to add a vault

---

Cancel
Save

3. Click **Save**.

Add a Kerberos environment

**i** **Version 6.0.7.0 or later recommended for Kerberos**  
 Any Delphix Engine intending to leverage Kerberos credentials should be running version 6.0.7.0 or later. Versions 6.0.0.0-6.0.6.1 may encounter issues in authentication ticket renewal, causing Environment and Dataset job failures. More information can be found in this Delphix [Knowledge Base](#) article

It is possible to create a Unix/Linux Standalone environment with Kerberos authentication.

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu, select **Environments**.
3. Then click on the plus icon to open a wizard to create a new environment.
4. Select your **Host OS** and **Server Type**, then select **Next**.
5. Under **Login Type**, select **Kerberos Authentication**.
6. If **Discover SAP ASE** is enabled, ASE DB Kerberos authentication will be available, select **Kerberos Authentication**.

**Discover SAP ASE**

Enabled

**Login Type**

Username and Password

Kerberos Authentication

**Principal**

sybase

.. .

7. Select **Submit**.

Changing the environment user

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu, select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.
4. On the grid of Environment Users, you can see existing users. Click the **plus icon**, to add a new user.
5. It is now possible to create a user with Kerberos Authentication. There can only be one Kerberos user per environment. The Principal is taken to the Kerberos Configuration.

It is possible to set the Kerberos user as Primary.

Changing SAP ASE DB user and DB password

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu, select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.

4. Click the SAP ASE Information **pencil** icon.

5. Click the edit icon and edit ASE DB User and ASE DB Password.
6. Click the **checkmark** to save.

#### Updating environment notes

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.
4. Under **SAP ASE Information**, you can see **Notes**. To edit click the **pencil** icon.
5. Click the **checkmark** to save.

#### Changing host address, SSH port number, and toolkit path

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Environments**.
3. Select an Environment, the **Details** tab allows you to see Environment information.

4. Click the **pencil** icon located next to **Attributes** to edit the Host Address or SSH Port number or Toolkit Path.
5. Select the **checkmark** to save.

### Adding and linking a dSource

#### Adding a dSource

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Environments**.
3. Select an Environment and click the **Databases** tab. This tab provides details on all the available repositories.
4. Click on the **Add dSource** link.

5. Click on a **Data Source**, then select **Kerberos Authentication**.

6. Complete all remaining fields, and then click **Submit**.

#### Linking a dSource

1. Login to the **Delphix Management** application as an **admin**.
2. From the **Manage** menu select **Datasets**.
3. Select a **Dataset**.
4. From the Actions menu located on the top-right select **Link dSource**.  
All information in the Link dSource screen is automatically filled in with the data you previously selected.

## Configuring OAuth2 authentication for API access

### Overview

This article provides instructions on how to set up Open Authorization 2.0 (OAuth2) on the 6.0.11 Delphix Engine. OAuth2 offers an alternative, password-less authentication method for API access to the Delphix Engine.

Delphix Engine (Masking and Virtualization) version 6.0.11.0 supports authentication using JSON Web Tokens (JWTs) issued by a known authorization server or identity provider (IdP). It is necessary for JWTs to contain a claim that can be used to associate an authentication request with a user that exists in the Delphix Engine. This article describes how to configure the Delphix Engine to validate tokens and associate token claims with Delphix Engine users.

 The authentication feature described in this section differs from the API token authentication feature supported by Delphix Engines registered with Data Control Tower (*formerly* Central Management). For more information on API token authentication, refer to [Data Control Tower](#)

### Configuration options

The following options for configuring OAuth2 for the Delphix Engine are available in the Delphix CLI (as the `sysadmin` user, under `service; oauth2`) as well as via the API endpoint `/resources/json/delphix/service/oauth2`.

Option	Description	Default (if applicable)
<code>audience</code>	Specifies the expected value of the audience claim ( <code>aud</code> ) of JWTs indicating that the tokens are intended for this particular Delphix engine.	<code>api://delphix</code>
<code>enabled</code>	Specifies whether the OAuth2 feature should be enabled.	<code>false</code>
<code>issuerURI</code>	<b>(Required)</b> Specifies the base location or identifier of the authorization server (IdP) which the Delphix Engine will use to validate incoming JWTs.	
<code>jwkSetURI</code>	Specifies the URI used to retrieve the JSON Web Key (JWK) set, if supported by the authorization server (IdP).	
<code>tokenSkewTime</code>	Specifies the maximum time difference (in seconds) allowed between the validity period of a JWT and the engine's current time.	<code>60</code>

Option	Description	Default (if applicable)
<code>userIdClaim</code>	Specifies which claim in a JWT should be used by the Delphix Engine (in conjunction with the <code>userMatchingFieldType</code> setting) to associate a token with a user configured on the Delphix Engine. The default ( <code>sub</code> ) corresponds to the subject claim of the token.	<code>sub</code>
<code>userMatchingFieldType</code>	Specifies which property of a Delphix Engine user will be used to match with the claim (specified in <code>userIdClaim</code> ) of a JWT. The Delphix Engine can be configured to match users based on a user's <code>name</code> , <code>emailAddress</code> , or <code>principal</code> properties.	<code>PRINCIPAL</code>

These options may also be set in the Delphix Setup application. Please refer to the following procedures for configuring OAuth2 parameters for new or existing Delphix Engines.

### OAuth2

Use OAuth2 access tokens

Issuer URI

`https://myissuer.com`

URI of the OAuth Authorization issuer.

Audience

`api://delphix`

The intended audience of the access tokens issued by the Authorization Server for Delphix Engine access.

User Identifying Claim

`sub`

The claim in a token that should be used to associate a JWT with a Delphix Engine user.

Show advanced ▼

### New engine configuration

Follow this procedure to configure OAuth2 on a new Delphix Engine.

1. Connect to the Delphix Engine at `http://>>` . The **Delphix Setup** application will launch when connecting to the server.
2. Enter the **sysadmin** login credentials; this account has a default username of **sysadmin** and password of **sysadmin**.
3. In the Authentication step of the Delphix Setup wizard, check the **Use OAuth2 access tokens** box and configure the OAuth2 settings as desired. (Refer to the table above for more information on these settings.)

4. Complete the remaining setup steps as usual.

#### Existing engine configuration

Follow this procedure to configure OAuth2 on an existing Delphix Engine.

1. Connect to the Delphix Engine at `http://>>`. The **Delphix Setup** application will launch when connecting to the server.
2. Enter the **sysadmin** login credentials.
3. In the **Authentication** tile, select **Modify**.
4. In the Authentication dialog, check the **Use OAuth2 access tokens** box and configure the OAuth2 settings as desired. (Refer to the table above for more information on these settings.)

#### Example of API access using OAuth2 token

1. Obtain a JWT from the Authorization Server (IdP). (The details for this process will vary depending on the IdP vendor.) For the purposes of this example, the contents of the token are stored in the environment variable `t`.
2. Access the `oauth2-login` API endpoint of the Delphix Engine, providing the OAuth2 token. In this example the session information is stored in the file `cookies.txt` in the working directory. For Virtualization Engines the `oauth2-login` API endpoint is `/virtualization/api/oauth2-login`. For Masking Engines the `oauth2-login` API endpoint is `/masking/api/oauth2-login`.

##### Virtualization API Endpoint Example

```
h=<engine address>; curl -i -X POST $h/virtualization/api/oauth2-login -H
"Authorization: Bearer $t" -b cookies.txt -c cookies.txt -H 'Content-Type:
application/json' -d '{"type": "APISession", "version": {"type":
"APIVersion", "major": 1, "minor": 11, "micro": 11}}'
```

##### Masking API Endpoint Example

```
h=<engine address>; curl -i -X POST $h/masking/api/oauth2-login -H
"Authorization: Bearer $t" -H 'Content-Type: application/json' -b cookies.txt
-c cookies.txt
```

3. Refer to the saved `cookies.txt` file in subsequent `curl` invocations. The example below can be used to list the users configured on the Delphix Engine.

##### Virtualization API Example

```
curl -X GET -b cookies.txt -c cookies.txt -H 'Content-Type: application/json'
$h/resources/json/delphix/user
```

##### Masking API Example

```
# Store authorization code returned by /masking/api/oauth2-login in $m
curl -i -X GET -b cookies.txt -c cookies.txt -H 'Content-Type: application/
json' -H "Authorization: $m" $h/masking/api/v5.1.11/users
```

## CLI access using OAuth2 token

When OAuth2 is enabled, CLI logins will prompt the user to supply either an OAuth2 access token or a password to authenticate:

### CLI Access Prompt with OAuth2 Enabled

```
$ ssh myengine -l admin
Enter access token or press enter to provide a password:
```

To authenticate using an OAuth2 token, paste its contents when this prompt is shown. As with API authentication, the OAuth2 token must be current (not expired) and must contain a claim that can be associated with a valid Delphix Engine user, based on the **userIdClaim** and **userMatchingFieldType** values set on the Delphix Engine.

To bypass OAuth2 authentication and use password authentication, press **Enter** when this prompt is shown and a conventional password prompt will be displayed.

## User matching policy

If the **userIdClaim** component of a JWT matches more than one Delphix Engine user (for example, if **userMatchingFieldType** is set to **EMAIL\_ADDRESS**, and the same email address is associated with multiple Delphix Engine users), the oldest user account (by time of creation) will be authenticated.

 **Suggestion**  
To ensure all users can be authenticated using OAuth2, make sure that the property specified in **userMatchingFieldType** is populated and unique for all Delphix Engine users.

## HTTPS Proxy Configuration

If the OAuth2 identity provider cannot be directly reached by a Delphix Engine, a HTTPS proxy may be used. The sysadmin user can create or modify HTTPS proxy settings via the CLI/API endpoint **service; proxy**, or in the **Delphix Setup** application by selecting to modify the **Outbound Connectivity** tile, checking the **Configure web proxy** box, and entering the host, port, and (optionally) username and password of the proxy server.

## Network and DNS management

You may want to manage and configure certain network services, such as DNS, for Delphix. Here we specify general network and connectivity requirements, as well as detail how you can test network performance. General Network and Connectivity Requirements.

This section covers the following topics:

- [General network and connectivity requirements](#)
- [Network performance configuration options](#)
- [Determining the Delphix server ID and host name](#)
- [Configuring multiple DNS domain names in DNS search list](#)
- [How to change the IP address of the Delphix engine](#)
- [How to change the hostname of the Delphix engine](#)
- [How to change the DNS server of the Delphix engine](#)
- [Configuring a second network interface](#)

## General network and connectivity requirements

### Overview

This topic covers the general network and connectivity requirements for the Delphix Engine, including connection requirements, port allocation, and firewall and Intrusion Detection System (IDS) considerations. For platform-specific network and connectivity requirements, see the relevant topics under the **Requirements** section for each platform.

### General outbound from the Delphix engine port allocation

Protocol	Port numbers	Use
TCP	25	Connection to a local SMTP server for sending email
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
UDP	162	Sending SNMP TRAP messages to an SNMP Manager
TCP	443	HTTPS connections from the Delphix Engine to the Delphix Support upload server
TCP/UDP	636	Secure connections to an LDAP server
TCP	8415	Connections to a Delphix replication target. See <a href="#">Configuring Replication</a>
TCP	50001	Connections to source and target environments for network performance tests.

### General inbound to the Delphix engine port allocation

Protocol	Port number	Use
TCP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
UDP	161	Messages from an SNMP Manager to the Delphix Engine
TCP	443	HTTPS connections to the Delphix Management Application

Protocol	Port number	Use
TCP	8415	Delphix Session Protocol connections from all DSP-based network services including Replication, SnapSync for Oracle, V2P, and the Delphix Connector.
TCP	50001	Connections from source and target environments for network performance tests via the Delphix CLI.

### Firewalls and intrusion detection systems (IDS)

Production databases on source environments (for dSources) are often separated from the non-production environment by firewalls. Firewalls can add milliseconds to the latency between servers. Accordingly, for best performance, there should be no firewalls between the Delphix Engine and the virtual database (VDB) target environments. If the Delphix Engine is separated from a source environment by a firewall, the firewall must be configured to permit network connections between the Delphix Engine and the source environments for the application protocols (ports) listed above.

Intrusion detection systems (IDSs) should also be made permissive to the Delphix Engine deployment. IDSs should be made aware of the anticipated high volumes of data transfer between dSources and the Delphix Engine.

## Network performance configuration options

- [Optimal network architecture for the Delphix engine](#)
- [Network operations using the Delphix session protocol](#)
- [Network performance test tool interface](#)
- [Working with dataset performance](#)
- [Network performance expectations and troubleshooting](#)

## Optimal network architecture for the Delphix engine

This topic describes basic network performance considerations for the Delphix Engine.

### Network architecture and latency

All VDB I/O operations are serviced over the network. Delphix uses NFS as the primary transport for Oracle VDBs, and iSCSI for MS SQL VDBs. The network architecture, latency, and capacity between the Delphix Engine and the target environment are key network components for improving the performance of a Delphix deployment. The latency between the Delphix Engine and the source environment is not relevant for the best performance of VDBs.

For optimal performance of VDBs, round-trip latency between the Delphix Engine and the target environment should be kept under 1 millisecond, and preferably in the range of 300 microseconds. If network latency exceeds 500 microseconds, the VDBs will not perform as well as a database connected to physical storage.

Latency can be introduced by having to route the network packets across multiple networks, or by the presence of routers, switches, and firewalls between the Delphix Engine and the target environment. Best practices to reduce network latency include:

- Keep the Delphix Engine on the same subnet as the target environment
- Reduce the number of hops between the Delphix Engine and the target environment
  - Reduce the number of switches in the network. Each switch can add 50 - 100 microseconds of latency to the network.
  - Reduce the number of routers in the network. Each router can add 500 - 1000 microseconds of latency in a network, and the round trip for an I/O operation could increase by as much as 1 - 2 milliseconds.
- There should be no firewalls between the Delphix Engine and the target environment.
- When linking the Delphix Engine to a source database across a WAN, consider the time needed for the initial link and load. It may be necessary to schedule the load operation as multiple steps across multiple days.

A common WAN deployment architecture

### Deployment of the Delphix engine on Separate sub-nets

Network throughput and bandwidth

Network throughput measures the rate at which data can be sent continuously between two servers on a network. Network throughput is affected by network latency, but the dominant factor affecting throughput is the bandwidth of the network. As a point of comparison, consider the bandwidth available for three types of Ethernet networks:

Ethernet type	Network Bandwidth
100Mb Ethernet (100Base-T)	~=10MB/sec
Gigabit Ethernet (GbE)	~=100MB/sec
10 Gigabit Ethernet (10GbE)	~=1GB/sec

Low network throughput can impact the Delphix Engine in a number of ways:

- Increasing the amount of time it takes to perform a SnapSync operation, both for initial load and subsequent regular snapshots
- Managing LogSync operations in a high change environment
- Poor VDB performance when an application is performing large sequential I/O operations, such as sequential table scans for reporting or business intelligence, or RMAN backups of the VDB.

Delphix Engine throughput must exceed the sum of the peak I/O loads of all VDBs. Delphix incorporates an I/O-Collector toolkit to collect I/O data from each production source database and pre-production server.

Best practices to improve network throughput include:

- Use 10 Gigabit Ethernet (10GbE)
- Use a dedicated storage network

If you are concerned about your network throughput, you can test it with the built-in CLI tool for network testing.

## Network operations using the Delphix session protocol

This topic describes how the Delphix Engine uses the Delphix Service Protocol (DSP) for network operations, and how this affects features such as replication, V2P, and SnapSync.

### Overview

Delphix Session Protocol, or DSP, is a communication protocol that operates at the session and presentation layer in the Open Systems Interconnection (OSI) model.

<b>Application Layer</b>	application specific logic
<b>Presentation Layer</b>	data encoding, digest, compression, encryption
<b>Session Layer</b>	connection management, error recovery, security, remote operation
<b>Transport Layer</b>	end-to-end connection, message segmentation, sequencing, reliability, flow control
<b>Network Layer</b>	packet fragmentation, routing, logical addressing
<b>Data Link Layer</b>	physical addressing
<b>Physical Layer</b>	media, signal, binary transmission

DSP supports the request-reply pattern for communication between two networked peers. In contrast to the traditional remote procedure call (RPC) models, which focus exclusively on low-level details such as data encoding and wireframing, DSP implements a generic session layer that supports a number of advanced functionalities desired for network communication, including:

- Full-duplex remote operation execution and end-to-end cancellation support
- Advanced connectivity model with connection trunking and ordered delivery
- Fault resilience with automatic connection and session recovery, exactly-once semantics, and optional data digest
- High performance with concurrent execution, session flow control, optional data compression, and bandwidth throttling
- Built-in security support with pluggable SASL authentication mechanisms and optional TLS encryption
- Asynchronous model for session management and remote operation

Most of the features above are essential to the proper operation of a distributed application and yet non-trivial to implement. By offering them in the framework, we can significantly simplify the development of enterprise quality distributed applications.

DSP is officially registered with the [Internet Assigned Numbers Authority](#) under the service name `dlpx-sp` and port number 8415.

Currently, DSP supports Java language binding and provides a java based service framework for distributed applications.

## Key concepts

The foundation of DSP is built on top of a few key abstractions, namely, **exchange**, **task**, **nexus**, and **service**. For an overview of how DSP works and the features it provides, let's start with these abstractions.

An **exchange** refers to an application-defined protocol data unit which may be a request or a response. DSP supports the request-response pattern for communication. For each request sent, there is a corresponding response that describes the result of the execution. An application protocol is made up of a set of exchanges.

A **nexus** (a.k.a., session) refers to a logical conduit between the client and server application. In contrast, a transport connection (a.k.a., connection) refers to a “physical” link. A nexus has a separate naming scheme from the connection, which allows it to be uniquely and persistently identified independently of the physical infrastructure. A nexus has a different lifecycle than the connection. It is first established over a leading connection. After it comes into existence, new connections may be added and existing ones removed. It must have at least one connection to remain operational but may live on even after all connections are lost. Nexus lifecycle management actions, such as create, recover, and destroy, are always initiated by the client with the server remaining passive.

A nexus has dual channels, namely, the fore channel and the backchannel. The fore channel is used for requests initiated from the client to the server, and the backchannel from the server to the client. From a request execution perspective, the nexus is full-duplex and the channels are functionally identical, modulo the operational parameters that may be negotiated independently for each channel. A channel supports a number of features for request processing, such as ordered delivery, concurrent execution, remote cancellation, exactly-once semantics, and throughput throttling.

A **service** refers to a contract that consists of all exchanges (both the requests and the corresponding responses) defined in an application protocol. Given the full-duplex nature of request execution in DSP, part of the service is fulfilled by the server and the remaining by the client, where the client and server are from the nexus management perspective.

A **task** implements a workflow that typically involves multiple requests executed in either or both directions over the nexus. A task is a self-contained building block, available in the form of a sharable module including both the protocol exchanges and implementation, that can be easily integrated into other application protocols. A library of tasks may significantly simplify distributed application development by making it more of an assembly experience.

The following is a diagram that illustrates the key abstractions and how they are related to each other.

## Security

As a network protocol, DSP is designed with security in mind from the onset. It supports strong authentication as well as data encryption. It follows a session-based authentication model which requires each connection to authenticate before it is allowed to join the session. Authentication is performed using the Simple Authentication and Security Layer (SASL) framework, a standard-based pluggable security framework. The currently supported SASL mechanisms include DIGEST-MD5, PLAIN with TLS, CRAM, and ANONYMOUS. Optionally, TLS encryption may be negotiated between the client and the server for data privacy.

## Performance

DSP offers a number of features to enable the support for high-performance network applications. For example, it allows multiple requests to be exchanged in both directions simultaneously, which provides effective pipelining of data transfer to minimize the impact of network latency while ensuring the total ordering at the same time. It supports trunking that can effectively aggregate the throughput across multiple connections, which is crucial for a long fat network (LFN) and 10GigE. It also provides optional compression support which boosts performance over a bandwidth-limited network. We have observed, through both internal benchmarking and in customer environments, DSP-based applications delivering multi GigE in an ideal environment and getting a performance boost of as much as x10 in bandwidth-limited settings.

## Resiliency

DSP automatically recovers from transient connection loss without any application involvement. It may also detect random data corruption on the wire and automatically recovers from it. In both cases, outstanding requests are retried once the fault condition is resolved.

DSP offers control over a remotely executing request. Once a request is initiated, the application may cancel it at any time before completion. In the rare event of a session loss, a new session creation request will be held until the old session has been reinstated. It ensures that we never leave any unknown or unwanted activities on the remote side and provides better predictability and consistency guarantees over an otherwise unreliable network.

## Diagnosability

Application exceptions encountered during remote execution of a request are communicated back to the initiator through DSP. A standard Java API is used to facilitate the handling of remote exceptions that is in many ways identical to local ones.

DSP provides detailed information and statistics at the session level. The information may be used to examine the state of the session as well as diagnose performance problems. It is currently exposed via an internal support tool called the JMX tool.

## Supported applications

Replication is the first feature to take advantage of DSP. It has been rebuilt on top of DSP and shipping in the field since 3.1. In the latest release, a number of host-based applications, such as SnapSync, V2P, and Delphix connector, use DSP as well.

## Network performance test tool interface

Accessing the network performance test tool

To access the Network Performance Test Tool:

1. In the top navigation bar, click **Resources**.
2. Select **Network Performance Tool**.

The **Network Performance Tool** page will appear. There are two tabs: **Testing** and **History**.

### Network Performance Tool

**Testing**    History

Select Test Type

Latency - between this engine and a selected environment

Throughput - between this engine and a selected environment

Number of requests to send

20

Request size (bytes)

16

**Run Test**

The testing tab

On the **Testing** tab, you can select one of three test types:

Test type	Parameters required
Latency	<ul style="list-style-type: none"> <li>• Environment – If you selected an environment in the <b>Datasets</b> panel, this field will auto-populate. See below for instructions on changing the selected environment.</li> <li>• Number of requests to send</li> <li>• Request size (bytes)</li> </ul>

Test type	Parameters required
Throughput	<ul style="list-style-type: none"> <li>• Environment</li> <li>• Duration – in seconds</li> <li>• Number of connections</li> <li>• Direction – Select either <b>Transmit</b> or <b>Receive</b></li> <li>• Block size (bytes)</li> </ul>
Delphix session protocol	<ul style="list-style-type: none"> <li>• Target Engine</li> <li>• Username</li> <li>• Password</li> <li>• Duration – in seconds</li> <li>• Block size (bytes)</li> <li>• Number of connections</li> <li>• Queue depth</li> <li>• Direction – Select either <b>Transmit</b> or <b>Receive</b></li> <li>• Traffic Options</li> </ul>

Selecting an environment

For either a Latency or Throughput test, you must select an environment. If you selected an environment in the **Datasets** panel, this field will auto-populate. If you need to select a different environment:

1. Next to the **Environment** field, click the button with three dots. The **Select Environment** screen will appear.

2. Select the environment you want to use in the test.

**Select Environment** ✕

\_\_\_\_\_

Environments	Hosts
source-l	source-l.dlpxdc.co
target-l	target-l.dlpxdc.co

Cancel **OK**

3. Click **OK**.

#### Running and canceling a network performance test

To run a test:

1. Enter all the required parameters.
2. Click **Run Test**.
3. To cancel the test click **Cancel**.

#### The history tab

In the **History** tab, you can view the results of all previous tests you have run.

1. Select the radio button for the type of test for which you want to see the results:
  - a. Latency, or
  - b. Throughput, or
  - c. Delphix Session Protocol
2. Optional: sort the tests by clicking one of the column headings.
3. Click the particular test for which you want to see the results.  
The details of that test will appear.
4. Click **OK** to return to the **History** tab.

Delphix session protocol test from primary engine to replication engine

Delphix uses the DSP protocol to communicate between primary and replication engines.

1. Login to Delphix Management application using an Engine administrator account.
2. Click the **Resource** menu and select **Network Performance Tool**.
3. Select the **Delphix Session Protocol** option.
  - a. Select Engine option to run the DSP test between a primary engine and a replication engine.
  - b. Provide hostname or IP address of the replication engine.
  - c. Provide admin user credentials for the replication engine. The user name must not include @DOMAIN or other qualifiers.
  - d. Enter a **Duration** in seconds (30 default).
  - e. Enter **Block Size** in bytes.
  - f. Enter the **Number of Connections** (optional).
  - g. Provide **Queue Depth**.
  - h. Select Direction - **Transmit** or **Receive**.
  - i. **Enter Traffic Options by selecting either Use compression or Use encryption.**
  - j. Click the **Run Test** button.

## Working with dataset performance

### Accessing the dataset performance graph

1. Log into the Delphix Management application.
2. In the **Resources** menu, select **Dataset Performance**.
3. Use the controls described below to view statistics and their related graphs.

### General graph display and controls

#### Dataset Performance

**Timescale:** Select from hour, 6 hours, day

**View:** View data by top 5 consumers or by the 75% percentile

**Dateline:** Displays timestamps of data points in the graph.

**Timeline selector:** Specifies the start and end time for the currently displayed data. The range displayed is controlled by selecting the slider. Drag the slider to view statistics for the specific time.

**Graph legend:** If more than one set of information is presented on the graph, Graph Legend displays a description and color for each set.

**Dataset table:** Displays the information for each Dataset in a table format. Selecting a Dataset link takes you to the Dataset Status page.

**Export:** Exports the displayed table data.

## Network performance expectations and troubleshooting

### Overview

Once you have run your [network performance tests](#) to each source and target environment, you should confirm that they meet expectations. Corporate networks commonly leverage 10Gbps "line speeds" between servers. Although networks are shared environments, switching infrastructure is typically used to isolate traffic between different hosts, with the goal of allowing each host to reach its potential. While many environments perform within the 70-90% range of line speed, in well-maintained environments we can see 90%+ line speed.

In some circumstances, you can exceed typical expectations by implementing more best practice recommendations – for example, putting two VMs on the same hypervisor (e.g. ESX) host, in the same chassis or blade enclosure, or when teamed (bonded) NIC cards are used for extra bandwidth. Furthermore, when Jumbo Frames are implemented correctly, they provide a substantial improvement.

If your network is not meeting expectations, you will almost always need help from someone whose role is focused on networking to help arrive at a root cause. You may also need to obtain temporary access to other VMs and/or physical hosts to isolate some issue(s). Additionally, you may need the help of Delphix Support or Professional Services to perform some tests from the Delphix Engine to systems that are not already connected environments within the Delphix product. (The CLI test will only work for environments connected to the Delphix Engine).

With assistance or not, you can do a number of things to narrow down the potential causes of poor performance between two systems by a process of elimination. Below are some high-level steps to consider. Keep in mind that network throughput will always represent the least performant component, so many of the steps below are intended to help isolate which component may be performing poorly.

Troubleshooting and information gathering questions in rough order of priority - record and share your answers

1. Have all source/target tuning settings been applied?
  - a. Is AIX in scope? LSO / LRO can have a significant impact, as can Jumbo Frames (see below)
2. What is the link speed on the hosts in question? Is NIC teaming / bonding / LACP in use?
  - a. Linux: `ethtool <device>`
  - b. Solaris: `dladm show-phys`
  - c. Windows: `wmic NIC where "NetEnabled='true'" get "Name,Speed"`
3. What are the test results with greater or fewer connections in parallel?
4. Can we test throughput to alternate servers? (See below)
5. What is the overall latency? What is the latency to each (OSI layer 3) hop? Is there one hop that consistency has a higher cost? (check the latency with ping and hops with traceroute)
6. How many devices (OSI layer 2) are in the path? Your network team will need to help you identify these devices.
  - a. Note: Only Layer 3 devices will show up when reviewing a traceroute however each layer two devices can impact traffic and each needs to be configured when implementing jumbo frames
  - b. Example devices in path to physical server: 1. virtual NIC -> 2. Virtual switch (ESX) -> 3. Chassis NIC -> 4. Rack switch -> 5. Core Switch -> 6. Rack Switch -> 7. Physical NIC
  - c. Example devices in path to virtual server: 1. virtual NIC -> 2. Virtual switch (ESX) -> 3. Chassis NIC -> 4. Rack switch -> 5. Chassis NIC -> 6. Virtual Switch (ESX) -> 7. Virtual NIC
7. What is the average network utilization on each hop? Is there congestion on any hop? (Network team will need to review)
8. Is QoS / VirtualConnect / 802.1p enabled? At what threshold will it engage? (Network team will need to review)
9. Is there a firewall or any deep packet inspection in the route? (Network team will need to review)
10. Are Jumbo Frames enabled on any or all hops? E.g. Delphix Engine, Virtual NIC, Virtual switch, and all hops down to the destination. (Network team will need to review)

- a. We have seen Delphix installations often benefit 10-20% from Jumbo frames, but certain platforms (such as AIX) can benefit much more dramatically
  - b. Note that JF enablement on two hosts without confirming all the network pieces are properly enabled will result in VERY poor performance
  - c. Test Jumbo Frames via with “Do Not Fragment” flag from the remote host to the Delphix Engine.
  - d. Note that typical MTU Jumbo Frame setting is 9000 bytes, although some vendors recommend a little above or below this.
  - e. The test below is at 8000, but you can test larger from there. Our goal is primarily to ensure that a number substantially larger than 1500 and somewhat close to the 9000 "de facto" standard is working.
  - f. Whenever two hosts connect, they perform a handshake called Path MTU negotiation, where they agree on the highest MTU they both support. This is how we avoid impact when communicating to hosts with differing MTUs.
  - g. `Linux$ ping -M do -s 8000 [Delphix_Engine_IP]`
  - h. `Windows> ping -f -l 8000 [Delphix_Engine_IP]`
  - i. `Solaris v10-# traceroute -F [Delphix_Engine_IP] 8000` ( "Do Not Fragment" not supported by ping on Solaris until v11)
  - j. `Solaris v11+# ping -s -D [Delphix_Engine_IP] 8972`
11. Depending on the results above, a dedicated network or VLAN may help. Consider if that is an option for you. (Your network team will need to review)

#### Testing throughput testing to alternate servers

This will help isolate where a problem may be.

1. Delphix to Server A – already known
2. Delphix to Server B – physical; helps us see if there is a problem with the original server NIC or physical network settings
3. Server B to Server C – physical; helps us see if there is a problem with the Delphix server NIC or physical network settings
4. Delphix to Server D – virtual; helps us see if there is a problem with the virtual network or Delphix settings
5. Server D to Server E – virtual; same host; helps us see if there is a problem with the virtual network on the host
6. Server D to Server F – virtual; different host; helps us see if there is a problem with the virtual network

#### Conclusion

If you need further help, please contact Delphix Support or Professional Services to assist in getting the best performance possible from your environment.

## Determining the Delphix server ID and host name

On occasion, it may be necessary to locate the **Delphix Server ID** and **Hostname**.

The Delphix Engine ID and Delphix Server ID are synonymous. The GUI currently uses "Server," and that is the terminology that will be used in this document.

The **Delphix Server ID** uniquely identifies each Delphix Engine. It is a 36-character hexadecimal string of the form **xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx**. You can view the Delphix Server ID in the Server Setup application, the Delphix Management application, or by using the Command Line Interface (CLI) method.

The **Hostname** is a name you assign. It typically matches the IP (DNS) name assigned to the Delphix Engine. The hostname can only be viewed by using the System Setup application or the CLI method.

### Server setup application method

Login to the Delphix Setup application with sysadmin-level credentials:

1. Access the Delphix Engine through the URL: `http://<Delphix Engine>/ServerSetup.html` where `<DelphixEngine>` is the DNS name or IP address of the Delphix Engine for which you wish to find the Delphix Server ID and hostname.
2. Enter a valid **Username**.
3. Enter a valid **Password**.
4. Click **Log In**.

On the **Dashboard** screen, there is a **System Summary** panel in the lower-left portion of the screen. The **Server ID** field displays the Delphix Server ID, in this example **564D39A8-5077-C9D0-9EFD-82E848EBDAB6**.

System Summary ⓘ	
<b>Server ID</b>	564D39A8-5077-C9D0-9EFD-82E848EBDAB6
<b>Manufacturer</b>	VMware
<b>Model</b>	Virtual_disk
<b>Serial</b>	6000c2907f0001dd8000c240feee5b8c
<b>Processor</b>	2 x 2.90GHz
<b>Memory</b>	7.3GB
<b>Features</b>	XPP, MDD
<b>Default locale</b>	en-US

The Delphix Engine Hostname is located on the same screen, in the **Network** panel. The **Delphix Engine Hostname** field displays the hostname information.

Network ⓘ	Modify
<b>Network Interface</b>	ens160
<b>Interface Configured</b>	Yes
<b>Jumbo Frames Enabled</b>	No
<b>IP Address Type</b>	DHCP
<b>IP Address</b>	10.43.3.98
<b>Subnet Mask</b>	255.255.0.0
<hr/>	
<b>Default Gateway</b>	10.43.0.1
<b>DNS Domain Name</b>	delphix.com
<b>DNS Servers</b>	172.16.101.11, 172.16.105.2
<b>Hostname</b>	js532.dcenter

## Delphix admin application

The Delphix Server Hostname is not available from this view but typically matches the IP (DNS) name assigned to the Delphix Engine.

Login to the Delphix Management application with delphix\_admin level credentials:

1. Access the Delphix Engine through the URL: `http://<Delphix Engine>/Server.html` where `<DelphixEngine>` is the DNS name of the IP address of the Delphix Engine for which you wish to find the Delphix Server ID.
2. Enter a valid **Username**.
3. Enter a valid **Password**.
4. Click **Log In**.
5. Under **System Summary**, the **Server ID** field displays the Delphix Server ID.

## CLI method

1. Use SSH to access your Delphix Engine: `ssh <userid>@<delphix_engine>` where `<userid>` is a user ID with either delphix\_admin- or sysadmin-level credentials.
2. Enter a valid password if prompted for one.
3. Enter `system ls`.

You will see an output similar to this example:

## Properties

```
type: SystemInfo
apiVersion:
type: APIVersion
  major: 1
  micro: 0
  minor: 5
buildTimestamp: 2015-02-24T09:24:58.000Z

```

The **Delphix server ID** is shown as the `uuid` property at the bottom of the output, and the **Hostname** is displayed in the `hostname` property.

4. Enter `exit` to leave the command-line interface.

## Configuring multiple DNS domain names in DNS search list

This topic describes the steps to configure multiple DNS domain names in the DNS search list.

### Procedure

Perform the following steps to configure multiple DNS domain names in the DNS search list.

1. Launch the Delphix Engine Setup interface using the sysadmin credentials.
2. Navigate to the **Network** widget and click **Modify**.
3. Under **DNS SERVICES**, use the **DNS Domain Name** and **DNS Servers** boxes for adding multiple DNS domain name configurations.

## Network ✕

Configure network interfaces and services. Modifying the settings of network interfaces and default gateway may cause the Delphix Engine to be unreachable from the browser. It is recommended that such configuration be done from the Command Line Interface on the system console after a successful install.

### NETWORK INTERFACES

ens192	Configured	<a href="#">Settings</a>
--------	------------	--------------------------

### ROUTING

**Default Gateway**  
10.43.0.1

### DNS SERVICES

Set up DNS (Domain Name System) if you have a DNS Server in your environment. This will allow you to use names that will resolve into IP addresses when configuring components for your Delphix Engine.

**Delphix Engine Hostname**  
sean6090.dcol2.delphix.com

#### DNS Domain Name ⓘ

#### DNS Servers ⓘ

Cancel
Save

Each domain name needs to be separated by a comma.

- If .local DNS domains are in use, then you must add these explicitly to the list of DNS domains configured in order for name resolution to be successful. Multiple .local subdomains can be added as desired (for example, dev.company.local), or "local" can simply be added to the DNS domain configuration to enable all .local domains to be successfully looked up in DNS. Multicast DNS is not currently supported by the Delphix Engine

In order to understand if there is more than one domain name in the search list, check for "DNS Suffix Search List" from the output of `ipconfig /all` in the Windows Server:

or check for "search" in `/etc/resolv.conf` on a Linux server:

```
[root@rhel62 ~]# cat /etc/resolv.conf search delphix.com nameserver
192.168.0.1
```

### To update DNS using the CLI:

1. Log into the CLI as sysadmin and navigate to **service > dns**.

```
ssh sysadmin@yourengine
> service
> dns
```

2. List the current DNS configuration and **update** to add new configurations.

```
> ls
> update
> set domain=xxx.xxx, xxx.xxx
```

3. **Commit** the action and verify the new list.

```
> commit
> ls
```

#### For example:

```
delphix> /service dns
delphix service dns> ls

Properties
type: DNSConfig
domain: delphix.com
node: (unset)
servers: 192.168.0.1

Operations
update
```

```
delphix service dns> update
delphix service dns update *> set
domain=delphix.com,one.delphix.com,two.delphix.com
delphix service dns update *> commit
delphix service dns>
delphix service dns> ls
```

#### Properties

```
type: DNSConfig
domain: delphix.com,one.delphix.com,two.delphix.com
node: (unset)
servers: 192.168.0.1
```

#### Operations

```
update
```

```
delphix service dns>
```

## How to change the IP address of the Delphix engine

### Changing the IP address

1. Stop all running VDBs by clicking the **Stop** button on the VDB card.
2. Disable all dSources.
3. You can use either the command-line interface or the Delphix Setup application to change the IP address of the Delphix Engine.
  - a. To use the command-line interface, follow the instructions described in [Setting Up Network Access to the Delphix Engine](#)
  - b. To use the Delphix Setup application, go to **System > Server Setup** in the Delphix Management interface, or click **Server Setup** in the Delphix Engine login screen.
    - i. In the **Network** panel, click **Modify**.
    - ii. Under **DNS Services**, enter the new IP address.
    - iii. Click **OK**.
4. Refresh all Environments by clicking the **Refresh** Symbol on the Environments screen.
5. Enable all dSources.
6. Start all VDBs by clicking the **Start** button on the VDB card.

### Changing the IP address via CLI

1. Stop all running VDBs by clicking the **Stop** button on the VDB card.
2. Disable all dSources.
3. Log into the Delphix CLI using your *sysadmin* account. You can find instructions on how to do this in the [Connecting to the CLI](#) article.

```
delphix> network
delphix network> setup
delphix network interface> list
NAME
vmxnet3s0
delphix network interface> select vmxnet3s0
delphix network interface 'vmxnet3s0'> get
  type: NetworkInterface
  name: vmxnet3s0
  addresses:
    0:
      type: InterfaceAddress
      address: 10.1.2.3/24
      addressType: STATIC
      enableSSH: true
      state: OK
  dataNode: DATA_NODE-34
  device: vmxnet3s0
  macAddress: 0:c:29:32:96:a3
  mtu: 1500
  mtuRange: 60-9000
  reference: NETWORK_INTERFACE-vmxnet3s0-DATA_NODE-34
  state: OK
```

4. Run the update command and update the address to the new IP address for the Delphix Engine.

```
delphix network interface 'vmxnet3s0'> update
delphix network interface 'vmxnet3s0' update *> edit addresses.0
delphix network interface 'vmxnet3s0' update addresses.0 *> get
Properties
  type: InterfaceAddress
  address: 172.16.151.154/24
  addressType: STATIC
  enableSSH: true

delphix network interface 'vmxnet3s0' update addresses.0 *> set address=10.1.2.
4/24
delphix network interface 'vmxnet3s0' update addresses.0 *> get
  type: InterfaceAddress (*)
  address: 10.1.2.4/24 (*)
  addressType: STATIC (*)
  enableSSH: true (*)
```

5. Commit the operation.

```
delphix network interface 'vmxnet3s0' update addresses.0 *> commit
delphix network interface 'vmxnet3s0'> get
  type: NetworkInterface
  name: vmxnet3s0
  addresses:
    0:
      type: InterfaceAddress
      address: 10.1.2.4/24
      addressType: STATIC
      enableSSH: true
      state: OK
  dataNode: DATA_NODE-34
  device: vmxnet3s0
  macAddress: 0:c:29:32:96:a3
  mtu: 1500
  mtuRange: 60-9000
  reference: NETWORK_INTERFACE-vmxnet3s0-DATA_NODE-34
  state: OK
```

6. Re-enable the VDBs and dSources running from the engine.

## How to change the hostname of the Delphix engine

### Changing the hostname

Perform the following steps to change the hostname of a Delphix engine.

 Currently, it is only possible to change the hostname via the Command Line Interface (CLI).

1. Stop all running VDBs by clicking the **Stop** button on the VDB card.
2. Disable all dSources.
3. Log into the Delphix CLI using your **sysadmin** username and password. If you are using the same interface that you connected to the CLI on, it will interrupt the connection. Therefore, it is recommended to log in to the CLI on the console.

```
ssh sysadmin@yourdelphixengine
```

4. Run the following commands.

```
dlpx01> network
dlpx01 network> setup
dlpx01 network setup> ls
Properties
  defaultRoute: 192.168.0.1
  dhcp: false
  dnsDomain: plb.internal
  dnsServers: 192.168.0.111,198.142.152.164,198.142.152.165
  hostname: dlpx01
  primaryAddress: 192.168.0.109/24

Operations
update
dlpx01 network setup> update
dlpx01 network setup update *> set hostname=newhostname
dlpx01 network setup update *> commit
```

5. If DHCP is being used, the Delphix Engine will expect the Hostname to be provided by the DHCP server. As such, there will be no property 'hostname' to update. This process requires changing the IP addressing configuration from DHCP to static address configuration. To proceed you will need to take the following action (making sure that there is no conflict between your DHCP server and the changes you are implementing).

```
dlpx01 network setup> update
dlpx01 network setup update *> set dhcp=false
dlpx01 network setup update *> set hostname=newhostname
dlpx01 network setup update *> commit
newhostname network setup> update
newhostname network setup update *> set dhcp=true
newhostname network setup update *> commit
```

```
newhostname network setup> ls
Properties
  defaultRoute: 192.168.0.1
  dhcp: true
  dnsDomain: plb.internal
  dnsServers: 192.168.0.111,198.142.152.164,198.142.152.165
  hostname: newhostname
  primaryAddress: 192.168.0.109/24
```

6. Re-enable the VDBs and dSources running from the engine.

## How to change the DNS server of the Delphix engine

When DHCP is enabled on the Delphix Engine, the DNS server cannot be changed in the GUI. In this case, the DNS server can be changed in the command-line interface (CLI). If the IP address, net mask, or any other properties of the network interface itself are not changed, then VDBs do not need to shutdown. Login via Hypervisor Console for the Delphix Engine virtual machine is optional.

Use the commands below and enter the address of a server or a comma-separated list of addresses in replace of the example servers.

```
ssh -l sysadmin DelphixEngineName
Password:
DelphixEngineName> service dns
DelphixEngineName service dns> update
DelphixEngineName service dns update *> set servers=1.1.1.1,2.2.2.2
DelphixEngineName service dns update *> commit
DelphixEngineName service dns> exit
```

If DHCP is disabled and the address is static, the DNS server can be updated via the GUI.

1. Login to **Delphix Setup** with the appropriate credentials.

2. Locate the **Network** tile in the Dashboard and select **Modify**.

3. Scroll down in the **Network** window.
4. Use the **DNS Domain Name** and **DNS Servers** boxes for new configurations.

## Configuring a second network interface

This topic describes how to configure a static IP address on a second network interface.

### Procedure

Perform the following steps to configure a second network interface.

1. Launch the Delphix Engine Setup interface using the sysadmin credentials.
2. Navigate to the **Network** widget and click **Modify** to view the available network interfaces, and select the new interface to be configured.
3. Click the **Settings** button next to the network interface that you want to configure.

### Network ✕

Configure network interfaces and services. Modifying the settings of network interfaces and default gateway may cause the Delphix Engine to be unreachable from the browser. It is recommended that such configuration be done from the Command Line Interface on the system console after a successful install.

#### NETWORK INTERFACES

<b>ens256</b>	Not configured	<a href="#">Settings</a>
<b>ens224</b>	Not configured	<a href="#">Settings</a>
<b>ens192</b>	Configured	<a href="#">Settings</a>

4. The **Network Interface Settings** screen appears. Select the checkbox before **Enabled** to enable the network.

## Network Interface Settings

### ens224

Enabled

DHCP

Static

**IP Address**

**Subnet Mask**

**MTU** ⓘ

Cancel

Save

5. Select one of the following: **DHCP** or **Static** and enter the **IP address** and **Subnet Mask** address in the respective fields.
6. **MTU**: Enter a value for the MTU field. This is the maximum size in bytes of a packet that can be transmitted on this interface.
7. Click **Save** to save the settings.

## NFSv4 configuration

### Overview

This article shows which OS versions support NFSv4. NFSv4 is enabled by default, but the target/staging hosts require additional configuration changes before it can be used.

**Redhat/SLES:** "NFSv4 Only - Enabling Recover Lost Locks" section under [Linux/Redhat/CentOs](#)

**AIX:** [IBM AIX](#) article.

OS version	NFSv4 support
RHEL 6.3 or later	Supported
SLES 11.4 or later	Supported
AIX 7.1, 7.2	Supported
Solaris 11	Supported

If these target host configurations are not set, the engine will choose NFSv3. The provided reason (e.g., "OS not supported") that is shown for choosing NFSv3 over NFSv4 can be observed under the Status tab of the selected VDB in the Delphix Engine GUI. Additional information is provided in this tab for datasets and current values.

### Dataset status tab NFS reasons

NFS Reason	Notes
Default	NFSv4 is used by default for client mounts.
Old RedHat	NFSv4 is used with RedHat versions 6.4 and newer.
Unsupported OS	NFSv4 is not supported for HP-UX clients.
DNFS	Oracle Direct NFS (dNFS) is in use by the database. NFSv4 is supported by dNFS with Oracle versions 12c and newer. Additionally, due to Oracle bug 33596056, dNFS does not work with NFSv4 in Oracle versions 19.12-19.15 and 21.1-21.6.
Tunable Override	The nfs.version tunable is set to force NFSv3 mounts.
Configuration Override	Appears with default operation, implies that a configuration parameter has changed.

NFS Reason	Notes
No Recover Lost Locks	On Linux hosts, if the required <code>recover_lost_locks</code> setting is not enabled for the NFS client, then NFSv4 cannot be used.
Incomplete v4 Config	On AIX hosts, if the <code>nfsrgyd</code> daemon is not running or reverse DNS lookup is missing, then NFSv4 cannot be used.

## NFSv4-Only mode

A Delphix Engine can be configured only to use [NFSv4](#) and disable NFSv3 services.

Behavioral Differences Compared Automatic (default):

- If NFSv4 is not supported on the mount, then the Delphix Engine will fail to mount the VDBs and return a user exception with the reason "NFSv4 is not supported".
- If dNFS is enabled, the Delphix Engine will attempt to use NFSv4 in Oracle versions 19.12-19.15 and 21.1-21.6 despite Oracle bug 33596056. Additional details are in this [KB](#).

If NFSv3 is enabled, it will be turned off when the option is set:

- If existing VDBs on a continuous data engine are using NFSv3, they will go down since the mounts will no longer serve data once the option is set.
- If the continuous compliance engine is using NFSv3 via [remote mounts](#), they can no longer access data once the option is set.

## Capacity and resource management

Delphix will be responsible for managing many different data sources and data types. As such, it is critical to understand how to manage your capacity and storage resources within each Delphix engine. Learn storage and quota best practices, as well as the different options to optimally manage capacity.

This section covers the following topics:

- [An overview of capacity and performance information](#)
- [Setting quotas](#)
- [Deleting objects to increase capacity](#)
- [Adding, expanding, and removing storage devices](#)
- [Delphix storage migration](#)
- [Managing source data](#)
- [An overview of held space](#)

## An overview of capacity and performance information

This topic describes the Delphix Engine performance reservoir and capacity threshold warnings and various ways to obtain information about capacity and resource usage for the Delphix Server.

### The performance reservoir and capacity threshold warnings

In order to obtain the best performance and continued operations, the Delphix Engine requires a certain amount (minimum 512GB) of free space of the total quota for storage space. As storage capacity approaches this threshold, the following system faults occur:

- When **85%** of the total storage quota is reached or **1536GB** of free space is remaining (whichever is less), a **Warning** fault is triggered. You can resolve this fault by deleting objects in the Delphix Engine, adding storage, or changing policies, as described in the topics [Adding, expanding, and removing storage devices](#), [Deleting objects to increase capacity](#). Additionally, refreshing target databases will clear the space the engine uses to track changes over time for each DB.  
**Note:**  
When a **Warning** fault is first raised, it will not impact the functioning of the system. However, there may be an impact to Oracle LogSync and SQL Server Validated sync when a **Warning** fault is seen as storage usage decreases following a **Critical** storage usage fault.
- When **90%** of the total storage quota is reached or **1024GB** of free space is remaining (whichever is less), a **Critical** fault is triggered. You cannot ignore or resolve this fault. This fault will have a significant impact on the system's behavior such as:
  - All pending link, sync, refresh, and provisioning processes will be canceled, and no new operations can be initiated
  - Scheduled replication processes will first check for capacity on the target engine and hold data (replication currently in progress to the engine will not be halted)
  - Policy operations such as SnapSync, snapshot, and refresh are suspended for **all** databases
  - dSources stop pulling in new changes. LogSync is suspended for all **Oracle dSources**. Validated sync is disabled for **SQL Server dSources**.
  - No virtual database (VDB) snapshots can be taken.
- When **95%** of the total storage quota is reached or **512GB** of free space is remaining (whichever is less), a second **Critical** fault is triggered. This fault will have a significant impact on the system's behavior and certain dSources and VDBs will stop in order to maintain data integrity. For example, SQL Server VDBs will shut down.

As the free space of the system improves, the following functionalities can be automatically or manually resumed.

- When the system falls below **95%** of the total storage quota, you can manually start SQL Server VDBs that had stopped
- When the system falls below **90%** of the total storage quota:
  - SQL Server VDBs that had stopped will automatically start
  - New link, sync, refresh and provisioning operations are allowed
  - Policy operations such as SnapSync, Snapshot, and Refresh resume for all databases
- When the system falls below **85%** of the total storage quota
  - dSources start pulling in new changes from their corresponding data sources. LogSync is resumed for **Oracle dSources**. Validated sync is enabled for **SQL Server dSources**.

For more information, see [Setting quotas](#)

### Ways to view capacity usage

You can access capacity and performance information for the Delphix Engine through several different means, including the **Dashboard** view, and the **Storage Capacity** screen.

The dashboard view

You can access the **Dashboard** view in the **Delphix Management** application by clicking **Dashboard** in the Manage menu. Note that the Dashboard view provides only summary information about capacity and performance. You must access the **Storage Capacity** and **Dataset Performance** screens in the **Resources** menu to manage storage space and database objects.

The Dashboard view provides more detailed information about the overall performance of the Delphix Engine:

- **Storage Capacity** - the amount of physical storage available and what is currently used
- **TimeFlow Ratio** - see above
- **VDB Ratio** - a measure of the amount of physical space that would be occupied by the database content against the amount of storage occupied by that same database content as VDBs.
- **Dataset Performance** - the amount of network bandwidth available and the amount that VDBs are currently utilizing, as well as information about specific VDB network usage

The storage capacity screen

You can access the **Storage Capacity** screen through the **Resources** menu in the **Delphix Management** application. The **Storage Capacity** screen now has an improved format the interface makes it easier to identify which datasets are consuming the most space on your Delphix Engine.

**Major additions in 6.0.6:**

- Users can now see what’s pinning a held space and batch delete the dependencies to free it up.

**What’s changed 6.0.6:**

- Snapshot Delete dialog now shows a tree of “prerequisites” and “dependencies” that must have operations performed on them / be deleted in order to enable the deletion of the locked root snapshot.
- The Snapshot Delete dialog now automates the steps.
- Held Space shown in the table now represents deadbeat Timeflows rather than Containers

For more information please refer to [Using and understanding the storage capacity screen](#)

## Using and understanding the storage capacity screen

The **Storage Capacity** screen can be reached via the **Capacity** item in the **Resources** menu. This screen shows how storage capacity is allocated for dSources, VDBs, and Snapshots, and permits storage space to be reclaimed through the deletion of objects and Snapshots.

### Storage Capacity Screen

Select the Reload Data button to clear your capacity cache and refresh the page. If you are clearing the cache of a large Delphix Engine, this operation could take several minutes. During this operation, the capacity page is not available.

The usage Graph at the top of the page provides a visual representation of the distribution of storage consumption across your engine.

- **Reserved** - The amount of reserved space is hard-coded to be 10% (maximum up to 1TB) of the system capacity and cannot be changed. The system has a 90% consumption cap.
- **Held** - Total held space size
- **Your data** - User data (snapshot, log, etc.); Includes shared space

• Currently, this only includes dataset space. It doesn't include space of the MDS.

Click a tab to view one of the following tables:

- **Datasets** - this tab shows a list of datasets on the engine ordered by the size of the dataset. You can filter the list by whether the dataset is VDB or dSource, whether the dataset is locked or unlocked, and the type of dataset. The drop-down drawer of each dataset shows some metadata about the dataset. If the dataset has descendants, the drop-down drawer will also show the list of **first-level** descendants. You can use the Action menu (...) to delete or refresh a dataset. If a dataset has descendants, the delete column will show a lock icon which opens a dialog explaining why this dataset is locked. Replicated datasets are excluded.
- **Snapshots** - rows are always sorted by descending size with a link to the dataset page for the Snapshot's parent dataset. Snapshots created from Replicas are excluded. The drop-down drawer for each snapshot shows the latest snapshot date of the dataset that this snapshot is from. If a snapshot has any descendants or can't be deleted due to descendants, the delete column will show a locked icon indicating this snapshot is locked. Clicking on the lock icon will display the snapshot why-locked dialog. Freshly created Snapshots are not displayed as this table is not updated automatically.
- **Held space** - provides a list of Held Space on the engine. You can search the held spaces by their names (in this case their references). As shown below users can now see what's pinning a held space and batch delete the dependencies to free it up.
- **Received replicas** - provides a list of Namespaces and by default is sorted by descending size. This tab is updated automatically (except the size). The drop-down drawer lists groups inside of each replicas sorted by size.
- **How it works** - provides general information about Storage, Retention Policy and Manual deletion.

Filters available are table-specific and do not apply to the content inside a drawer

- **View** - Dataset type (VDB, dSource, vFiles, etc.)
- **Status** - locked/unlocked for deletion
- **Type** - database type (Oracle, SQL Server, AppData, etc.)
- **Search** - search by name (case insensitive)

Select  to export the information provided in the grid to a.csv file. Note: Only the page you are viewing will be exported.

The **table** section displays a set of information about objects tracked by the Delphix Engine. The information displayed varies depending on the selected tab.

<b>Datasets</b>	
Dataset	Dataset's type as an icon and name. Datasets created from replicas are excluded and deleted Datasets have a strike-through their name.
Size	Space actually used by the object.
Group	The name of the Dataset Group.
Delete	Either a Trashcan or a locked icon will be displayed. The Trashcan opens a confirm delete dialog, for Oracle users can select to provide credentials. A Lock icon as shown below opens a dialog explaining why the selected object cannot be deleted.

Action	Refresh actions that can be taken against the Dataset. <ul style="list-style-type: none"> <li>• Refresh N/A</li> <li>• Refresh Dataset</li> </ul>
<b>Snapshots</b>	
Timestamp	The timestamp reflecting when the snapshot was taken.
Size	Space actually used by the snapshot.
Dataset	The name of the Dataset.
Group	The name of the Dataset Group.
Delete	Either a Trashcan or a locked icon will be displayed. The Trashcan opens a confirm delete dialog. A Lock icon as shown below opens a dialog explaining why the selected object cannot be deleted.
<b>Held space</b>	
Object	The name of the object.
Size	Space actually used by the object.
Delete	For Held Space every row has a lock icon for opening up the Why-locked dialog.
<b>Received replicas</b>	
Namespace	Once replication is complete, the target Engine will create a received replica, also known as a namespace.
Size	The amount of space used by the Namespace.

Dataset Table or Snapshot drawer provides information on dependent or descendant. The inner dependency table is direct children only and has the same behavior as the outer table. Filter or sorting from the outer table does not apply to the inner table.

dbdhcp2:gli 482.95MB gli

Oracle 11.1.0.7.0

**Dependent Datasets**

Dataset	Size	Group	Delete	Action
VDB-1 Oracle 11.1.0.7.0	134.11MB	gli		...
Parent VDB Oracle 11.1.0.7.0	133.97MB	gli		...

Items per page: 15 1 – 2 of 2 |< < > >|

Current Copy Size 443.55MB  
 DB Log Size 19.75MB  
 Total Snapshot Size 19.57MB  
 Temp File Size 0.00B  
 Shared Snapshot Space 0.00B

dbdhcp1 217.53MB Untitled

Oracle 10.2.0.5.0

The **Delete dataset dialog** - this dialog provides information on why a dataset cannot be deleted. It displays **all** descendants of a dataset, as well as any self-service objects on any of the descendant datasets. You can trace the chain of descendants from the current dataset all the way to leaf datasets. Click **Copy to Clipboard** to copy the list of descendants to clipboard.

## Delete Dataset DBOMSR433BE8 ✕

### Unable to delete dataset DBOMSR433BE8

**DATASET DBOMSR433BE8 IS LOCKED DUE TO THE FOLLOWING DEPENDENCIES:**

VDB "VDBO\_MXK" has been provisioned from it

VDB "VDBO\_BOL" has been provisioned from it

Self Service template "MultiSourceTemplate" has a reference to it

**DATASET VDBO\_MXK IS LOCKED DUE TO THE FOLLOWING DEPENDENCIES:**

Self Service container "MultiCont1" has a reference to it

**DATASET VDBO\_BOL IS LOCKED DUE TO THE FOLLOWING DEPENDENCIES:**

Self Service container "MultiCont2" has a reference to it

Copy to Clipboard Close

The **Delete snapshot dialog** - The new snapshot dialog provides the complete steps on how to unlock the locked snapshot for deletion. It also allows users to select descendants and batch delete them. The dialog shows a tree of **prerequisites** and **dependencies** that must have an operation performed or be deleted in order to enable the deletion of the locked root snapshot. **Prerequisites** refer to operations that must be performed before the object it's associated with can be deleted. Examples of prerequisite operations include: removing a keep-forever retention policy from a snapshot, deleting a Self-Service bookmark, or refreshing a dataset. **Dependencies** refer to objects that must be deleted before the parent object can be deleted. There is also a special **All (other) Snapshots**

dependency item. This item represents all children snapshots of the parent Timeflow, which will also need to be removed, minus those with a dedicated row in the table.

## Understanding Delphix disk usage

Within the Delphix Timeflow, incremental restore points are called Snapshots. Delphix Snapshots use a shared block architecture to provide all the functionality of daily full backups using only a tiny percentage of the storage for full backups. Because shared block architectures are not common, a "common sense" understanding of how storage is associated with a Snapshot can be misleading.

- The size of a Snapshot is defined to be the size of changes that are unique to that Snapshot. In other words, changed blocks that are only associated with that one Snapshot.
- The latest Snapshot will always have 0 sizes initially, as there are no changes associated with it, nothing has changed since the Snapshot was taken, so there is no space used by unique changes.
- A block can be shared by multiple Snapshots if the block has not changed between the creation of those Snapshots. Any blocks that are shared amongst multiple Snapshots are accounted for in the shared Snapshot Space total.

The following screenshot provides an example of disk usage.

Dataset	Size	Group	Delete	Action										
CDOMSHSRD97A <small>Oracle 18.3.0.0.0</small>	1.14GB	test		...										
<table border="1"> <tr> <td>Current Copy Size</td> <td>1.01GB</td> </tr> <tr> <td>DB Log Size</td> <td>18.80MB</td> </tr> <tr> <td>Total Snapshot Size</td> <td>118.12MB</td> </tr> <tr> <td>Temp File Size</td> <td>0.00B</td> </tr> <tr> <td>Shared Snapshot Space</td> <td>Not available</td> </tr> </table>					Current Copy Size	1.01GB	DB Log Size	18.80MB	Total Snapshot Size	118.12MB	Temp File Size	0.00B	Shared Snapshot Space	Not available
Current Copy Size	1.01GB													
DB Log Size	18.80MB													
Total Snapshot Size	118.12MB													
Temp File Size	0.00B													
Shared Snapshot Space	Not available													
> CDOMSHTG661F <small>Oracle 18.3.0.0.0</small>	1.02GB	test		...										
> VDBO_OBA <small>Oracle 18.3.0.0.0</small>	1,009.71MB	test		...										
> DBOMSRBBD06C <small>Oracle 18.3.0.0.0</small>	922.83MB	test		...										
> CDOML0SRB5A3 <small>Oracle 18.3.0.0.0</small>	891.08MB	Untitled		...										
> CDOML0TG4F5E <small>Oracle 18.3.0.0.0</small>	859.85MB	Untitled		...										

- **Current Copy Size:** The current copy size is the amount of space used on the Delphix Engine by the VDBs data but across all the Time flows.
- **DB Log Size:** The DB log size is the size for archive log files.
- **Temp File Size:** This field is currently not active (for future use).
- **Container Size:** The container size is the size of the whole dataset.
- **Total Snapshot Size:** The total snapshot size is the size of all snapshots combined, including anything shared.
- **Shared snapshot space:** The shared snapshot space is the space shared by snapshots.

## Reviewing historical capacity from the CLI

You can retrieve historical capacity data through the Delphix Command Line Interface (CLI).

If your Delphix Engine is a new engine you would log in as Engine Admin and ssh admin@your engine. Engines created before 5.3.1 and upgraded to 5.3.1 or later will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then disabling delphix\_admin.

### Process

1. Log in as Delphix Admin (or an account with admin privileges)

```
ssh delphix_admin@yourengine
```

2. Navigate to capacity system historical

```
delphix > capacity system historical
```

3. Then you can list a start and end date for the utilization

```
delphix capacity system historical > list startDate=<time> endDate=<time>
```

For example, looking at the system space utilization, we can show 8 hours starting Sep 1 with the following:

We can also set the output detail level to different granularity, which is based on **seconds**.

```
delphix> capacity
delphix capacity> system
delphix capacity system> historical
delphix capacity system historical> list startDate=2016-09-01T00:00:00.000Z
endDate=2016-09-01T08:00:00.000Z
TIMESTAMP SOURCE.ACTUALSPACE VIRTUAL.ACTUALSPACE
2016-09-01T00:25:11.359Z 5.05TB 9.58TB

```

## Setting quotas

This topic describes how to set quotas for database objects.

1. Log into the **Delphix Management** application.
2. Select **Manage > Datasets**.
3. Select the **Configuration** tab for the object you want to set a quota for.
4. Select the **Policies** tab and from the Quota tile select **Customize this policy**.
5. In the **Quotas** column, click next to the **group** or **object** for which you want to set a quota.

6. In the **Quota Policy** window enter the amount of storage space you want to allocate for a quota.
7. Click **Save** to set the amount.

### Quotas and Low Space Errors

Be very careful setting quotas. As a group or virtual database (VDB) approaches the quota level, snapshots may fail and logs may not be captured, causing LogSync to fail.

## Quota thresholds

The following is a table of the thresholds and a description of the actions taken at each threshold. This behavior is generic across all engines.

Thresholds	Default ranges	Actions taken
<b>Critical</b>	Quota $\geq$ 95%	<ul style="list-style-type: none"> <li>• Disable VDBs and dSources under quota (for a group quota, everything inside gets disabled).</li> <li>• Disallow jobs detailed in the DB actions table below.</li> <li>• Cancel all in-flight jobs listed in the DB actions table except for enabling.</li> <li>• Poll every minute.</li> </ul>

Thresholds	Default ranges	Actions taken
<b>Resume</b>	95% > Quota ≥ 90%	<ul style="list-style-type: none"> <li>VDBs and dSources disabled by <b>critical</b> quotas will not be automatically re-enabled (DBs can still be manually re-enabled).</li> <li><b>Resume</b> fault is triggered if the quota has fallen from the <b>critical</b> threshold and if a DB was disabled from hitting the <b>critical</b> threshold.</li> <li><b>Warning</b> fault is triggered.</li> <li>Poll every 3 minutes.</li> </ul>
<b>Warning</b>	90% > Quota ≥ 80%	<ul style="list-style-type: none"> <li><b>Warning</b> fault is triggered.</li> <li>VDBs and dSources disabled from hitting <b>critical</b> quota will be re-enabled.</li> <li>Poll every 3 minutes.</li> </ul>
<b>Safe</b>	80% > Quota	<ul style="list-style-type: none"> <li>VDBs and dSources disabled from hitting <b>critical</b> quota will be re-enabled.</li> <li>Poll every 5 minutes.</li> </ul>

If a DB was disabled prior to reaching the **critical** quota, it will not be automatically re-enabled when falling to an acceptable range or when the quota is removed.

### Disallowed database actions when in quota critical threshold

Here is a table of the actions that are not allowed when the quota is in the critical threshold.

#### DB actions table

Target is group	Target is not group
<ul style="list-style-type: none"> <li>Refresh target in the group.</li> <li>Sync target in the group.</li> <li>Link into the group.</li> <li>Provision into the group.</li> <li>Enable target in the group.</li> </ul>	<ul style="list-style-type: none"> <li>Refresh target in the group.</li> <li>Sync target in the group.</li> <li>Enable target in the group.</li> </ul>

If a **critical** quota is placed on a target, dSources, and VDBs can still provision to groups that are quota below the **critical** threshold.

## Deleting objects to increase capacity

This topic describes how to delete database objects to create additional capacity.

Deleting unused or outdated objects should be a regular part of Delphix Engine administration. This is especially important to prevent low space errors, which can cause the Delphix Engine to stop. The Delphix Engine holds a maximum of 400 objects.

1. Log into the **Delphix Management** application.
2. Select **Resources > Storage Capacity**.
3. Next to the object you want to delete select the **Trashcan**.
4. In the **Delete** dialog, select **Force Delete**. Oracle users will have the option to provide additional credentials.

**Delete Dataset Child VDB** ✕

Are you sure you want to delete dataset "Child VDB"?

Force Delete

Provide privileged credentials

Cancel Delete

5. Click Delete.

### **Dependencies**

If there are dependencies on the snapshot, you will not be able to delete the snapshot free space; the dependencies rely on the data associated with the snapshot. These items are displayed with a lock icon next to the name.

## Delete Dataset dbdhcp1

### Unable to delete dataset dbdhcp1

**Dataset dbdhcp1 is locked due to the following dependencies:**

VDB "C3" has been provisioned from it

VDB "C1" has been provisioned from it

**Dataset C3 is locked due to the following dependencies:**

VDB "C4" has been provisioned from it

VDB "C6" has been provisioned from it

Self Service template "JSDataTemplate(C3)" has a reference to it

**Dataset C4 is locked due to the following dependencies:**

VDB "C5" has been provisioned from it

Self Service container "JSContainer(C4)" has a reference to it

**Dataset C1 is locked due to the following dependencies:**

VDB "C2" has been provisioned from it

Copy to Clipboard

Close

## Adding, expanding, and removing storage devices

- Multiple Device Removal in the Delphix Engine 6.0.12.0 and higher version introduces a breaking kernel module change that requires a reboot to load the new module. Therefore, a deferred reboot engine upgrade operation will be unable to remove devices until a reboot is performed.

### Prerequisites

For expanding a storage device after initial configuration, first make sure to add capacity to it using the storage management tools available through the device's operating system. For example, capacity can be added in vSphere using the **Edit system settings**.

- **VMware Hypervisor (vSphere)**

Rebooting the Delphix Engine to add/expand storage is not typically necessary when using vSphere.

The guidelines for adding initial storage using all 4 virtual SCSI controllers should cause the Delphix Engine to see new storage without a reboot. However, if the new storage is leveraging a new virtual SCSI controller, the Delphix Engine will need a reboot to detect the new storage. See [Deployment for VMware](#) for more information.

### Adding or increasing storage and/or cache

If it is available you can add more storage devices to the Delphix Engine.

1. Launch the **Delphix Setup** application and log in using the **sysadmin** credentials.
2. In the **Storage** section of the **Server Setup Summary** screen, click **Modify**.
3. For engines backed by disks
  - a. Under the **Block Storage** tab, the Delphix engine should automatically detect any new storage devices. If a newly added storage device does not appear in the **Storage** section of the **Server Setup Summary** screen, click **Rediscover**.
  - b. Select the **Enable** check box before the device name to add the device to the storage pool and click **Save**.
4. For Delphix Cloud Engines
  - a. You can modify the maximum amount of data that can be stored by the s3 storage under the **Object Storage** tab.
  - b. The **Block Storage** tab lets you modify the number of EBS volumes used for cache. Please see step 3 above.
5. Click **Save**.

### Expanding a storage/cache device

1. Launch the **Delphix Setup** application and log in using the **sysadmin** credentials.
2. In the **Storage** section of the **Server Setup Summary** screen, click **Modify**.
3. Under the **Block Storage** tab, select **Expand** for each device that you want to expand. The **Expand** checkbox appears next to the name of devices that have added capacity (in other words, the underlying LUN has been expanded), and the **Unused** column indicates how much capacity is available for each device.

**Note:**

It is imperative that the VMDKs created and assigned to the Delphix Engine do not exceed the capacity of the backing datastore. Any ‘overcommitment’ of storage resources can be expected to cause an unplanned outage, and may not be recoverable.

4. Click **Save**.

## Removing device storage

1. Launch the **Delphix Setup** application and log in using the **sysadmin** credentials.
2. In the **Storage** section of the **Server Setup Summary** screen, click **Modify**.

3. In the **Block Storage** tab, uncheck the **Enable** box for any storage device that will be removed.
  - a. A minimum of 10GB of object storage is required, thus, a device or devices must be enabled to accommodate for at least 10GB. This will give an error otherwise.

- Once the desired storage devices are disabled, click **Save**.
- The removal will appear as a job in the **Running Actions** section.

## Delphix storage migration

### Getting started

Delphix storage migration allows you to remove storage devices from your Delphix Engine, provided there is sufficient unused space, thus allowing you to repurpose the removed storage device to a different server. You can also use this feature to migrate your Delphix Engine to different storage by adding the new storage devices and then removing the old storage devices.

**Feature compatibility**

This feature is only compatible with Delphix Engine Releases 5.0.4 and later. This feature is not supported on Delphix Cloud Engines (Engines backed by s3 storage).

### Possible Migration Methods

Method	Pros	Cons
Delphix Storage Migration	<ul style="list-style-type: none"> <li>• Good for migrating storage that was accidentally added to the engine or added to the engine improperly (wrong size).</li> <li>• May reduce fragmentation if new storage is added to replace old disks.</li> <li>• Good for migrating a small amount of storage (e.g.: &lt; 10 TB).</li> </ul>	<ul style="list-style-type: none"> <li>• With Delphix versions prior to 5.3, this mapping table can consume 2-3GB of RAM for every 1TB of allocated data that is migrated, if the disk being removed has a high level of fragmentation. From version 5.3, DxFs will migrate the data in larger blocks, comprising both allocated and unallocated space. This allows for significantly fewer mapping entries, with memory usage typically reduced to 50-100MB per TB of allocated data that is migrated.</li> <li>• May increase fragmentation on remaining disks if no new disks are added.</li> <li>• Depending on the size of the disk and storage performance this method could be less performant than other methods.</li> <li>• Each device removed could take longer than the previous one as data is remapped across the remaining disks.</li> <li>• The maximum number of 20 devices can be removed in releases prior to Delphix version 5.1.</li> </ul>
vMotion	<ul style="list-style-type: none"> <li>• Fast</li> </ul>	<ul style="list-style-type: none"> <li>• If there is high fragmentation on the existing disks, this is copied to the new disks.</li> </ul>

Method	Pros	Cons
Delphix Replication	<ul style="list-style-type: none"> <li>• Data is completely rewritten from one Delphix Engine to another which significantly reduces fragmentation on the new Delphix Engine.</li> <li>• Replication can be configured to limit the impact on the network (compression and bandwidth).</li> <li>• Replication is resumable from network disruptions, on in the event of replication source or target stack/ host restarts. It is currently NOT possible to manually suspend/ resume a replication job.</li> </ul>	<ul style="list-style-type: none"> <li>• Depending on the number of objects to replicate as well as network and storage performance, this method could be considered slow.</li> <li>• This does require an outage to "migrate" the objects from the replication source Delphix Engine to the replication target Delphix Engine - outage time depends on several factors like the number of objects, incremental replication time, time to enable/disable objects, etc.</li> <li>• Only migrates storage objects like VDBs/dSources, and dependent environment information. Other items like users/policies/events/job history/config templates are NOT replicated.</li> </ul>

## Understanding Delphix storage migration

Delphix storage migration is a multi-step process:

1. Identify a storage device for removal. The device you choose will depend on your use case.
  - a. To remove extra storage that is unused, you can select any device for removal. For best performance, select the device with the least allocated space; typically, this is the device that you added most recently. The allocated space is defined by the `usedSize` property of the storage device:

```
test-env@delphix 'Disk10:2'> ls
Properties
  type: ConfiguredStorageDevice
  name: Disk10:2
  bootDevice: false
  configured: true
  expandableSize: 0B
  model: Virtual disk
  reference: STORAGE_DEVICE-6000c293733774b7bb0e4aea83513b36
```

```

serial: 6000c293733774b7bb0e4aea83513b36
size: 8GB
usedSize: 7.56MB
vendor: VMware

```

- b. To migrate the Delphix Engine to new storage, add storage devices backed by the new storage to the Delphix Engine. Then remove all the devices on the old storage.
2. Use the Delphix command-line interface (CLI) to initiate the removal of your selected device.
3. Data will be migrated from the selected storage device to the other configured storage devices. This process will take longer the more data there is to move; for very large disks, it could potentially take hours. You can cancel this step if necessary.
4. The status of the device changes from **configured** to **unconfigured** and an alert is generated to inform you that you can safely detach the storage device from the Delphix Engine. After this point, it is not possible to undo the removal, although it is possible to add the storage device back to the Delphix Engine.
5. Use the hypervisor to detach the storage device from the Delphix Engine. After this point, the Delphix Engine is no longer using the storage device, and you can safely re-use or destroy it.

## Limitations of Delphix storage migration

After removal, the Delphix Engine uses memory to track the removed data. In the worst-case scenario, this could be as much as 2-3 GB of memory per TB of used storage. Note that this is used storage; the overhead of removing a 1TB device with only 500MB of data on it will be much lower than the overhead of removing a 10GB device with 5GB of data on it.

## User interface

Delphix storage migration is currently available exclusively via the CLI. There are two entry points.

- `verifyStorageDeviceRemoval` - Verifies available pool space and available memory.
- `startStorageDeviceRemoval` - Kicks off job, detailed discussion of job concurrency/recovery.

## Device removal for storage migration

### Do not remove a configured storage device

Do not remove a configured storage device or reduce its capacity. Removing or reducing a configured storage device will cause a fault with the Delphix Engine, and will require the assistance of Delphix Support for recovery.

1. Identify which device you want to remove.
  - a. If you are using a VMware **RDM** disk, note the UUID of the device by looking at its name in the vSphere GUI. For more information, see the [Getting the UUID of a RDM Disk from VMware, via the vSphere GUI](#) article.
  - b. If you are using a VMware **virtual** disk, note the UUID of the device via the vSphere API. See the section of this [VMware KB article](#) on how to get the UUID of your virtual disk.
  - c. In EC2, note the attachment point – e.g., `/dev/sdf`.
  - d. In KVM, note the UUID.
2. Log in to the Delphix CLI as a **sysadmin** user.
3. Navigate to the storage/device directory with `cd storage/device`.
4. Select one or more devices to remove and make note of the name (e.g., select "Disk10:2" and "Disk10:3").

```
test-env@delphix storage/device> ls
Objects
NAME      CONFIGURED  SIZE  EXPANDABLESIZE
Disk10:2  true       8GB  0B
Disk10:0  true       24GB 0B
Disk10:1  true       8GB  0B
Disk10:3  true       8GB  0B
```

5. (For VMware only) Confirm the disk selection is correct by validating that the serial matches your UUID:

```
test-env@delphix storage device 'Disk10:2'> ls
Properties
  type: ConfiguredStorageDevice
  name: Disk10:2
  bootDevice: false
  configured: true
  expandableSize: 0B
  model: Virtual disk
  reference: STORAGE_DEVICE-6000c2909ccd9d3e4b5d62d733c5112f
  serial: 6000c2909ccd9d3e4b5d62d733c5112f
  size: 8GB
  usedSize: 8.02MB
  vendor: VMware
```

6. Navigate to `storage/remove` . Run `verify` and set the devices to be removed, as shown below.

```
test-env@delphix storage remove > verify
test-env@delphix storage remove verify *> set devices="Disk10:2,Disk10:3"
test-env@delphix storage remove verify *> commit
  type: StorageDeviceRemovalVerifyResult
  newFreeBytes: 15.85GB
  newMappingMemory: 3.14KB
  oldFreeBytes: 23.79GB
  oldMappingMemory: 0B
```

7. Navigate to `storage/remove` . Run `start` and set the devices to be removed, as shown below.

```
test-env@delphix storage remove > start
test-env@delphix storage remove start *> set devices="Disk10:2,Disk10:3"
test-env@delphix storage remove start *> commit
  Dispatched job JOB-4
  STORAGE_DEVICES_START_REMOVAL job started.
  STORAGE_DEVICES_START_REMOVAL job completed successfully.
```

**Note** : This does not signify that the device migration has been completed. A

`STORAGE_DEVICE_REMOVAL` job will start for each device to be removed, which handles the data migration from that disk.

8. Wait for device evacuation to complete. Alternatively, you can cancel the evacuation.

**Note:**

Do not detach the device from the Delphix Engine in your hypervisor until the data evacuation is completed. You can monitor the progress of the STORAGE\_DEVICE\_REMOVAL job in the Management GUI under **System >Jobs**.

- Once the device evacuation has been completed, the job will finish and a fault will be generated. Detach the disks from your hypervisor and the fault will clear on its own. An example of the fault created is shown below.

The screenshot shows the 'DELPHIX MANAGEMENT' interface with a 'Faults' section. The 'Current' tab is active, showing a table of faults. One fault is listed with a severity of 'WARNING', diagnosed on 'Nov 2, 2021 1:54 PM', with the title 'Device evacuation completed', and target 'Disk2:2'. A detailed view of this fault is shown on the right, including the date, title, target, details, and user action.

Severity	Diagnosed	Title	Target
WARNING	Nov 2, 2021 1:54 PM	Device evacuation completed	Disk2:2

**WARNING**  
 Date: Nov 2, 2021 1:54 PM  
 Title: Device evacuation completed  
 Target: Disk2:2  
 Details: The evacuation of Disk2:2 (scsi-3600c29da4d7af5c0dd4b9d38784ba03) has been completed.  
 User Action: Remove the device from the hypervisor.

**Using VMDKs**

When using VMDKs, deleting the wrong VMDK could cause data loss. Therefore, it is highly advisable to detach the device, then verify that the Delphix Engine continues to operate correctly, and lastly delete the VMDK.

**Getting the UUID of an RDM disk from VMware via the vSphere GUI.**

In the event that the disk serial number displayed in Delphix does not match the UUID in VMware, the Delphix Engine must be powered off and back on in order to make VMware provide the correct values to the guest operating system (Delphix). This has been necessary when using **vmkfstools** with **setuuid**. When forcing the guest OS to re-read the SCSI sense data for the device, VMware still provides the original values. Even after a simple reboot VMware still provides the previous UUID values. It was not until the VM was explicitly powered off and back on did VMware present the new UUID values to the guest. After which the UUIDs matched between the **vmkfstools getuuid** command and the CLI output.

In the ESX graphical user interface (GUI), select your **VM**.

- Click **Edit settings**.
- If not already displayed, select the **Hardware** tab.
- Select the **device** you want to remove.
- Click **Manage Paths**.

The UUID of the device appears in the title bar, as seen below.

### Getting the UUID of a VMDK from VMware, via ssh to the ESX server

1. ssh onto the ESX server as the root user.
2. Navigate to the directory containing the .vmdk files for the Delphix VM.

Use the `'vmkfstools -J getuuid <.vmdk filename>'` command to obtain the UUID, **for** example:

```
/vmfs/volumes/25894daa-f7b2b044/delphix01-2356 # vmkfstools -J getuuid
delphix01-2356_1.vmdk
UUID is 60 00 C2 91 01 bc 8e 72-31 a4 cd b0 b3 f6 e5 74
```

## Getting the UUID of a VMDK from VMware, via VMware PowerCLI

```
PS C:\> Connect-VIServer -Server durban -Protocol https -Username root -Password
root_password
```

Name	Port	User
----	----	----
durban	443	root

```
PS C:\> Get-VM delphixVM | Get-HardDisk | select name,filename,@{name="UUID";expr={$_.
extensiondata.backing.uuid}}
```

Name	Filename
UUID	-----
----	
----	
Hard disk 1	[zfs_delphixVM] dlpx-5.1.9.0-432-61155cf.
.. 6000C294-a115-0327-e417-02560d86e944	
Hard disk 2	[zfs_delphixVM] dlpx-5.1.9.0-432-61155cf.
.. 6000C299-38fe-5050-1eb2-1ee6db62b257	
Hard disk 3	[zfs_delphixVM] dlpx-5.1.9.0-432-61155cf.
.. 6000C294-662d-c674-8957-03e0514b7006	
Hard disk 4	[zfs_delphixVM] dlpx-5.1.9.0-432-61155cf.
.. 6000C29d-0719-1072-0f85-96da2efef4a3	

```
PS C:\> Disconnect-VIServer
```

Confirm

Are you sure you want to perform **this** action?

Performing operation "Disconnect VIServer" on Target "User: root, Server: durban, Port: 443".

## Managing source data

The **Managed source Data** dashboard tile provides an aggregate sum of the size of ingested source databases. This helps to understand the total amount of data per-engine that is managed by Delphix.

Managed Source Data refers to the size of the source data that is ingested and managed by the Delphix Engine. It is the physical, allocated size of the source database.

Today, the value displayed represents the source data size for Oracle, SQL Server, and SAP ASE databases. Since this value is a measure of source size, it is not affected by Delphix constructs or operations, e.g. the sizes of dSources, VDBs, snapshots. Since the intent is to measure the size of the sources, data from replication or Selective Data Distribution are not included in the sum for the engine. The total usage is displayed in gigabytes.

When an admin (Delphix Management Application) or sysadmin (Delphix Setup) login to the Delphix Engine they will have access to the Managed Source Data tile (shown below) from their dashboard.

Selecting the **View** link located on the top-right takes users to the Managed Source Data page. This page provides a detailed breakdown of the total usage and can also be reached via **Resources > Managed Source Data** from the navigation bar.

**Blue question marks** indicate:

- A “fallback” value is being used in the sum: A fallback value is used when sources are unavailable at the time when the usage query is made (e.g., the source is disabled), a “fallback” value is used in the sum. The fallback value refers to the last usage value Delphix collected while connected to the source.
- Sources that are not included in the sum: These are source types for which Delphix does not currently collect data (for example, sources like EBS, DB2, HANA, PostgreSQL).

Hovering over the **blue question marks**, a tooltip appears to describe the exact situation (whether or not Delphix used historical data/fallback values or if the source for collection is unsupported).

Managed Source Data

Managed Sources    How It Works

Name	Last collected	Space used	Type Of Data
CDOMSHSRD97A	Sep 29, 2021 12:24 PM	2.22 GB	Oracle
DBOMSRBDC6C	Sep 29, 2021 12:24 PM	2.12 GB	Oracle
CDOMLOTG4F5E	Sep 20, 2021 2:00 PM	1.69 GB	Oracle
CDOMSHSRD97APDB1	Sep 29, 2021 12:24 PM	773.63 MB	Oracle
CDOMSHSRD97APDB2	Sep 29, 2021 12:24 PM	763.63 MB	Oracle
CDOMSHSRD97APDB3	Sep 29, 2021 12:24 PM	763.63 MB	Oracle
CDOMLOTG4F5EPDB3	Sep 20, 2021 2:00 PM	762.84 MB	Oracle
Delphix_Admin	Sep 17, 2021 10:30 PM	3.88 MB	MSSQL Server
CDOMLOSRS5A3PDB1	Sep 29, 2021 12:24 PM	Copy query	Oracle

**Total Space Used**

9.03

GB\*

Sep 29, 2021

MSSQL Server	3.88 MB
Oracle	9.02 GB

\*Space usage data is available when Delphix sources are able to be monitored.

To search the **Managed source Data** table, enter the name of the data source you are looking for. The grid will refresh to display the selected data source. Select to refresh data to get updated space usage information. To export the information provided in the grid to a .csv file select.

**Backend data refresh**

The backend data refreshes at a regular interval but does not trigger a UI refresh.

## An overview of held space

### Scenario description

The existence of a Held Space is not indicative of an issue but rather a representation of an underlying storage dependency.

There are three scenarios that can create Held Space.

#### Scenario 1:

The first scenario can occur when you replicate a dSource to a second engine, which we'll call a Replication Target.

If you then provision a VDB from the Replication Target, and the dSource is subsequently deleted from the Replication Source, you will create a Held Space when that delete replicates to the Replication Target engine.

When this happens, the deleted dSource is removed from the target, but its storage remains held because it is needed by the replica provisioned VDB.

### Replication Held Space (Scenario 1)

Held Space can be viewed in the **Storage Capacity** screen by selecting the Held Space tab.

Object	Size
STORAGE_CONTAINER-96	74.49MB

#### Scenario 2:

The second scenario can occur in the context of a snapshot that is in use by a Delphix Self-Service branch or bookmark.

The snapshot may be removed via policy, but until the branches and/or bookmarks that leverage that snapshot are removed, its space will be held.

**Scenario 3:**

The third scenario can occur during Selective Data Distribution where a masked VDB that is provisioned from a dSource is replicated to a Replication Target.

The metadata objects relating to the dSource could contain sensitive information like hostnames, user names, and passwords. Hence they are not replicated to the Replication Target. The data belonging to the dSource is replicated after redacting any sensitive information. This redacted data shows up as held space.

**Scenario 4:**

The first scenario is caused by a failed or interrupted Replication job and results in held space on the Replication source engine. During replication, all data blocks to be replicated are serialized for transfer. Once the transfer is complete, the serialized data is released.

However, if a Replication job fails, the serialized data is retained until the next successful Replication job execution, or the Replication Profile is deleted - whichever happens first.

In a scenario where dSource and VDB snapshots in the serialized data reach the Retention Policy limit before the Replication job successfully executes, that snapshot data will become held space. This is most likely to happen if either of the following is true:

- A failed Replication job goes a long time before being successfully re-run.
- Replication schedules are configured with a period that is longer than one or more Retention Policies.

## Monitoring and log management

Using both Delphix and its associated datasets will generate many types of logs. Monitoring these logs are a key component of good diagnosability. Here, we explain the types of logs that Delphix creates as well as the monitoring tool integrations we support, such as SNMP and Splunk.

This section covers the following topics:

- [Configuring SNMP](#)
- [Viewing action status](#)
- [Viewing jobs](#)
- [System faults](#)
- [Accessing audit logs](#)
- [Creating support logs](#)
- [Setting support access control](#)
- [Setting syslog preferences](#)
- [Diagnosing connectivity errors](#)
- [Email \(SMTP\) alert notifications](#)
- [Splunk integration](#)
- [Fluentd plugin service for API modules](#)

## Configuring SNMP

This topic describes how to configure SNMP.

Starting with version 6.0.6.0 the Delphix Engine adds support for SNMP version 3 by implementing the User Security Model (USM) of the SNMP version 3 (SNMPv3) specification. Version 3 of SNMP adds stronger security compared to version 2.

 When SNMP v2 is configured and enabled, SNMP v1 is also configured and enabled. Similarly, v2 is configured and enabled with v3. This is a known behavior of the net-snmp package used to implement SNMP on the engine.

USM replaces the community string as in SNMP version 2 with user records. The Delphix engine can both receive and send SNMP version 3 messages only by using the USM security model. The USM model provides more security over version 2 by hashing passwords and encrypting the payload.

The Delphix Engine includes an SNMPv3 agent that is only capable of responding to read-only operations, such as GET messages using the User Security Model. USM users can be configured via the GUI, CLI, or API. Each user is composed of a username, authentication password, authentication protocol, privacy password, and a privacy protocol.

The Delphix Engine is also capable of sending alerts and faults over SNMP with the User Security Model. Messages are sent identically as with SNMP version 2 except that the USM model is used to authenticate and encrypt the alert message against a customer's manager. Users will need to properly configure their managers to receive messages. The use of the test function can be used to test configuration.

### Prerequisites

There are no prerequisites for enabling SNMP to provide system status. The following are prerequisites for sending alerts to an external SNMP manager.

- At least one SNMP manager must be available and must be configured to accept SNMPv2 InformRequest notifications.
- Delphix's MIB (Management Information Base) files must be installed on the SNMP manager or managers. These MIB files describe the information that the Delphix Engine will send out. They are attached to this topic.

File name	Content-type	File Size
<a href="#">DELPHIX-ALERT-MIB.txt</a>	text/plain	5 kB
<a href="#">DELPHIX-MIB.txt</a>	text/plain	0.8 kB

### Configuring SNMP for v2

1. On the Delphix Engine login screen, select **Delphix Setup**.
2. In the Delphix Setup login screen, enter the **sysadmin** username and password.
3. Click **Log In**.

4. From the **Delphix Setup**, select **Preferences > SNMP Configuration**.

5. Select **Enable**.
6. Select **SNMP Version 2**.

## SNMP Configuration ✕

---

**Simple Network Management Protocol**

Enable

**SNMP Version**

SNMP Version 3 (recommended)  SNMP Version 2

System Status
Warnings and Alerts

---

Settings for SNMP GET request to query system status.

**Community String** ⓘ

**Authorized Network** ⓘ

0.0.0.0/0 (Allow all clients)

127.0.0.1/32 (Block all clients)

Custom

**System Location** ⓘ

7. In **Community string**, enter the community string. It is the string that SNMP clients must provide in order to be authorized to retrieve SNMP information from the Delphix Engine.
8. OPTIONAL: change the following settings:
  - a. **Authorized network** – The set of client IP addresses (in CIDR notation) authorized to retrieve SNMP information from the Delphix Engine. To allow all clients, set this to 0.0.0.0/0 (the default). To prevent all clients from connecting, set this to the loopback address, 127.0.0.1/32.
  - b. **System location** – A free-form text description of the Delphix Engine's physical location. This is provided as the value for MIB-II OID.
9. Click **Save** to commit the SNMP configuration.

### Configuring SNMP for v3

1. On the Delphix Engine login screen, select **Delphix Setup**.
2. In the Delphix Setup login screen, enter the **sysadmin** username and password.
3. Click **Log In**.

4. From the **Delphix Setup**, select **Preferences > SNMP Configuration**.

5. Select **Enable**.
6. Select **SNMP Version 3** (recommended).
7. Click **Save** to commit the SNMP configuration.

#### Configure SNMP version 3 agent

After enabling SNMP and choosing version 3, the SNMP agent can be configured with the User Security Model (USM) users.

1. Click on **System Status**.
2. Click on the **+** to show the **New SNMP USM User Information** dialog.
3. Provide the following information for the user:
  - a. **Username** - A string representing the name of the user.
  - b. **Authentication method** - An indication of whether messages sent on behalf of this user can be authenticated, and if so, the type of authentication protocol that is used. Users can select from:
    - MD5** -the HMAC-MD5-96 authentication protocol.
    - SHA** -the HMAC-SHA-96 authentication protocol.

- c. **Authentication passphrase** - If messages sent on behalf of this user can be authenticated, this key will be used with the authentication key for use with the authentication. This field requires a minimum of 8 characters.
  - d. **Encryption method** - Provides support for data confidentiality. The designated portion of an SNMP message is encrypted and included as part of the message sent to the recipient. Users can select from  
**AES** - Advanced Encryption Standard  
**DES** - Data Encryption Standard
  - e. **Encryption passphrase** - If messages sent on behalf of this user can be encrypted, this key will be used with the encryption method for use with the authentication. This field requires a minimum of 8 characters.
4. Click **Save** to add your user.
- 

### Configuring SNMP version 3 managers

1. Click on the **Warnings and Alerts** tab.
2. Choose the **Severity** of the alerts that are sent via SNMP. The severity is ranked in order from most restrictive to least restrictive: critical, warning, and informational. Setting the severity critical will only include critical alerts while setting to informational will cause an informational, warning and critical alerts to be sent over SNMP to all managers.
3. Click **+** to add a manager to show the **New SNMP manager information** dialog.
4. Provide the following information:
  - a. **Username** - A string representing the name of the user.
  - b. **Host address** - Host or IP address.
  - c. **Port** - Port used by the SNMP Engine.
  - d. **Authentication method** - An indication of whether messages sent on behalf of this user can be authenticated, and if so, the type of authentication protocol that is used. Users can select from:  
**MD5** -the HMAC-MD5-96 authentication protocol.  
**SHA** -the HMAC-SHA-96 authentication protocol.
  - e. **Authentication passphrase** - If messages sent on behalf of this user can be authenticated, this key will be used with the authentication key for use with the authentication. This field requires a minimum of 8 characters.
  - f. **Encryption method** - Provides support for data confidentiality. The designated portion of an SNMP message is encrypted and included as part of the message sent to the recipient. Users can select from  
**AES** - Advanced Encryption Standard  
**DES** - Data Encryption Standard
  - g. **Encryption passphrase** - If messages sent on behalf of this user can be encrypted, this key will be used with the encryption method for use with the authentication. This field requires a minimum of 8 characters.
5. By default, TRAP messages are sent and require the agent's authoritative engine id for the user to be configured with the SNMP engine ID from the Delphix Engine, which can be obtained via the CLI. Click Use **Inform instead of Trap** to use INFORM messages, which are more reliable and require less configuration at the expense of higher network traffic.
6. Click **Save**.

### CLI: viewing SNMP engine ID

#### Viewing SNMP Engine ID

```
> service snmp v3
```

```

service snmp v3> ls
Properties
  type: SNMPV3Config
  enabled: true
  engineId: 0x80001f88801ad80b5e62a7f85f00000000
  location: Unknown
  securityModel: USM
  severity: WARNING

Children
manager
usm

Operations
update

```

## Supported MIBs

The Delphix software can be configured to send SNMP traps when Delphix alerts are generated as described in the procedure above. In order to process these traps in your SNMP manager software, you will need the base Delphix MIB and the Delphix Alert MIB.

In addition to generating traps, the Delphix Engine supports read-only access to the following MIBs for basic system monitoring purposes.

- The following MIB-II object hierarchies are defined in [RFC 1213](#):
  - system (OID .1.3.6.1.2.1.1): Provides basic system identity information
  - interfaces (OID .1.3.6.1.2.1.2): Provides network interface information including I/O statistics
  - IP (OID .1.3.6.1.2.1.4): IP protocol information including IP addresses configured, routes, and IP statistics
- The following UCD objects defined in <http://www.net-snmp.org/docs/mibs/ucdavis.html>
  - memory usage (OID .1.3.6.1.4.1.2021.4)
  - CPU usage (OID .1.3.6.1.4.1.2021.11)
  - Disk I/O statistics (OID .1.3.6.1.4.1.2021.13.15)

## Examples

The following examples assume that you have enabled SNMP on a Delphix Engine named example.company.com, and have set the community string to "public".

1. Walking the MIB-II objects using the net-snmp snmpwalk tool:

```

$ snmpwalk -v 2c -c public example.company.com
SNMPv2-MIB::sysDescr.0 = STRING: Delphix Engine 5.1.6.0 DelphixOS 5.1.2017.03.2
4
SNMPv2-MIB::sysObjectID.0 = OID: SNMPv2-SMI::enterprises.41028
DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (476432) 1:19:24.32
SNMPv2-MIB::sysContact.0 = STRING: administrator@company.com
SNMPv2-MIB::sysName.0 = STRING: example.company.com
SNMPv2-MIB::sysLocation.0 = STRING: VM Host
...

```

2. Walking Disk read and write I/O statistics:

```
$ snmpwalk -v 2c -c public example.company.com .1.3.6.1.4.1.2021.13.15.1.1.12
UCD-DISKIO-MIB::diskIONReadX.1 = Counter64: 11310593921
UCD-DISKIO-MIB::diskIONReadX.2 = Counter64: 334
UCD-DISKIO-MIB::diskIONReadX.3 = Counter64: 334
UCD-DISKIO-MIB::diskIONReadX.4 = Counter64: 865912605
UCD-DISKIO-MIB::diskIONReadX.5 = Counter64: 867599133
UCD-DISKIO-MIB::diskIONReadX.6 = Counter64: 865339677
UCD-DISKIO-MIB::diskIONReadX.7 = Counter64: 11309258752
UCD-DISKIO-MIB::diskIONReadX.8 = Counter64: 0
UCD-DISKIO-MIB::diskIONReadX.9 = Counter64: 1822880256
seb-laptop:~$ snmpwalk -v 2c -c public example.company.com .1.3.6.1.4.1.2021.1
3.15.1.1.13
UCD-DISKIO-MIB::diskIONWrittenX.1 = Counter64: 22337830400
UCD-DISKIO-MIB::diskIONWrittenX.2 = Counter64: 0
UCD-DISKIO-MIB::diskIONWrittenX.3 = Counter64: 0
UCD-DISKIO-MIB::diskIONWrittenX.4 = Counter64: 45118203392
UCD-DISKIO-MIB::diskIONWrittenX.5 = Counter64: 45137660928
UCD-DISKIO-MIB::diskIONWrittenX.6 = Counter64: 45139064320
UCD-DISKIO-MIB::diskIONWrittenX.7 = Counter64: 22337830400
UCD-DISKIO-MIB::diskIONWrittenX.8 = Counter64: 0
UCD-DISKIO-MIB::diskIONWrittenX.9 = Counter64: 33023515648
```

### 3. Retrieving the system uptime:

```
$ snmpget -v 2c -c public example.company.com .1.3.6.1.2.1.1.3.0
DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (1453172) 4:02:11.72
```

## Viewing action status

This topic describes how to view the status of actions for the Delphix Engine.

To view the status of actions that are currently running on the Delphix Engine, open the **Action sidebar**. To view details of currently-running and completed jobs, open the **Dashboard**.

### Action sidebar procedure

1. Login to the **Delphix Management** or **Delphix Setup** application. Depending on the width of the window, the **Action sidebar** may be automatically displayed on the right of the screen.
2. To see the **Action sidebar**, click **Actions** on the top navigation bar.

### Description

The **Action sidebar** consists of two sections. The top section lists actions that are currently running on the Delphix Engine. The bottom section, labeled **Recently completed**, contains actions that have recently been completed.

Each action is initially collapsed and only presents the title of the action. Click an action to expand it and see more details such as progress, elapsed time, and a description of the operation in progress.

The following is an example of the **Action sidebar** when an Enable action is running.

When an action has been completed it will move down to the bottom of the panel under **Recently completed**. The following is an example of the **Recently completed** section when a Refresh action is has completed.

If you are a Delphix Admin or a System Admin, you will be able to see all the actions of your respective application. If you are not an admin user, you will only see actions you have permission to see.

### Sub-action

Each action may contain one or several sub-actions which represent the execution of a subset of the action itself. Click an action to see its sub-actions and their respective details. Note that the list of sub-actions is created dynamically during the execution of the action.

The following is an example of an Environment Refresh action and its sub-actions.

## Errors

When an error condition occurs during the execution of an action, the background color of the action's box becomes red, and the action remains in the top section until you dismiss it.

- Click the **action** title to expand it. The action will expand to display a description of the error, suggestions to resolve it, and sometimes the raw output of command execution.

To dismiss the action:

- Click the **X** next to the action displaying an error.

The following is an example of an action failure displayed in the **Action sidebar**.

## Viewing jobs

Login to the **Delphix management** application using **admin** credentials. From the **System** menu select **Jobs**. The **Jobs** panel displays all jobs that have been initiated by the Delphix Engine, and their status.

Enter filter text to reduce the results to only those rows matching the text entered.

Customize results by selecting from a Predefined Range or from a Custom Range.

Select a job to view more details.

Click the **Export** button to download the current page of results to a file of comma-separated values (CSV).

**i Job Retention**

The Jobs panel retains records of the most recent 10,000 jobs that have been initiated by the Delphix Engine. Delphix administrators may use the **job/retention** CLI to retain a larger number of jobs.

## System faults

### Overview

The Faults screen provides information on states and configurations that may negatively impact the functionality of the Delphix Engine and which can only be resolved through active user intervention. When you login to the **Delphix management** application as admin, the number of outstanding system faults appears on the right-hand side of the navigation bar at the top of the screen. Faults serve as a record of all issues impacting the Delphix Engine and can never be deleted. However, ignored and resolved faults are not displayed in the faults list.

The **Faults** screen as shown below has two tabs, **Current** and **Archive**.

Severity	Diagnosed	Title	Target
WARNING	Dec 19, 2018 2:32 AM	TCP slot table entries below recommended minimum	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 19, 2018 2:32 AM	TCP WMEM default is below the recommended value	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 19, 2018 2:32 AM	TCP RMEM default is below the recommended value	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 2:23 PM	Invalid database credentials	Boomerang
WARNING	Dec 18, 2018 9:52 AM	TCP slot table entries below recommended minimum	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:52 AM	TCP WMEM default is below the recommended value	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:52 AM	TCP RMEM default is below the recommended value	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:40 AM	Incorrect toolkit owner	bbdhcp-AHCI-58503.dcenter.delphix.com
WARNING	Dec 18, 2018 9:39 AM	Incorrect toolkit owner	bbdhcp-tgt-AHCI-58503.dcenter.delphix.com

**WARNING**  
 Date: Dec 19, 2018 2:32 AM  
 Title: TCP slot table entries below recommended minimum  
 Target: bbdhcp-AHCI-58503.dcenter.delphix.com  
 Details: The TCP sunrpc.tcp\_slot\_table\_entries property is currently set to '16' which is below the recommended minimum value of 128.  
 User Action: Raise the sunrpc.tcp\_slot\_table\_entries value to at least 128.

### System Faults screen

1. The number of system faults.
2. The **Faults** screen has two tabs, **Current** and **Archive**. Details of the selected fault are displayed on a card located to the right of the fault list. In the **Archive** tab, you can switch between **Resolved** or **Ignored** faults and reset all ignored faults.
3. Selecting **Refresh (Manual)**, will refresh the faults table manually, or you can select one of the other available options from the drop-down menu, available options include; Manual, 1 Second, 1 Minute, 5 Minutes.  
(Note: as there is no longer a Refresh button on the screen, you must select Refresh (Manual) to refresh the screen.)
4. To search the **Faults** table, enter the name of the object you are looking for. The grid will refresh to display the selected object. You can also sort using the column headings.

Resolve All will resolve all the faults in your system.

Select to expand or close the objects in the grid.

Select to export the information provided in the grid to a.csv file.

5. You can select and resolve multiple faults; the card panel will display how many of each type are selected. For example:

**There are 2 WARNING items selected**

**There are 0 CRITICAL items selected**

6. Details for the selected fault are displayed on a card. You can resolve or ignore faults by selecting the appropriate link at the bottom of the card.

#### Resolving and Ignoring Faults

Ignoring a fault will also ignore future faults of that exact type against the same object, so that future fault conditions will not be re-diagnosed even if the fault condition persists or recurs. No further notifications will be received for that specific fault condition. It is advisable to only ignore faults when the following criteria are met:

- The fault is caused by a well-understood issue that cannot be changed.
- Its impact on the Delphix Engine is well understood and does not require action.

For example, if you think that knowing about this error in the future will be important, use "Resolve" rather than "Ignore". If you reset ignored items, this clears all ignored faults, but it leaves them as resolved and does not restore the actual fault. For reset ignored faults, new faults against the same object will no longer be ignored and you will again receive notifications. Examples: If you ignore a fault "Unable to ping host" for target "192.168.1.1", Delphix ignores "Unable to ping host" errors against target 192.168.1.1. You will never see the "Unable to ping host" fault again for that target 192.168.1.1 unless you reset ignored items. Similarly, some faults are raised against snapshots which are part of a dSource. Ignoring those errors only ignores similar errors for that exact snapshot. Tomorrow's snapshot could produce the fault again.

#### Delphix object-based environment monitor faults

Delphix now has a self-contained Java-based discovery infrastructure that consolidates with environmental monitoring, communicates via a common framework, and is able to provide feedback.

The environment monitor previously only created faults for "hosts" and "sources." There are several faults that more logically apply to other Delphix objects, such as repositories, which are DB install files. Posting them against sources results in fault duplication. The environment monitor now posts faults against -- and re-associates the offending faults with -- the correct objects. Consequently, users see fewer errors that are easier to diagnose.

#### Viewing faults

To view the list of active system faults:

1. In the top navigation bar, click **System** then **Faults**.
2. In the Faults screen, click any fault in the list to expand it and see its details.  
The details for the selected Fault will be displayed in the details card located on the right.

Each fault comprises six parts:

- **Severity** – How much of an impact the fault will have on the system. A fault can have a severity of either **Warning** or **Critical**.
  - A **Warning Fault** implies that the system can continue despite the fault but may not perform optimally in all scenarios.
  - A **Critical Fault** describes an issue that breaks certain functionality and must be resolved before some or all functions of the Delphix Engine can be performed.
- **Date** – The date that the Delphix Engine diagnosed the fault.
- **Title** – A short descriptive summary of the fault

- **Target** – The object against which the fault was posted. Faults will be posted against the host for incorrect environment configurations, sources for problems with the database, and repositories for issues with the installation.
- **Details** – A detailed summary of the cause of the fault
- **User action** – The action you can take to resolve the fault

## Addressing faults

After viewing a fault and deciding on the appropriate course of action, you can address the fault through the user interface (UI). You can mark a fault as **Ignored** or **Resolved**. If you have fixed the underlying cause of the fault, mark it as **Resolved**. Note that if the fault condition persists, it will be detected in the future and re-diagnosed. You can mark the fault as **Ignored** if it meets the following criteria:

- The fault is caused by a well-understood issue that cannot be changed
- Its impact on the Delphix Engine is well understood and acceptable

In this case, the fault will not be re-diagnosed even if the fault condition persists. You will receive no further notifications.

To address a fault follow the steps below.

1. In the top menu bar, click **Faults**.
2. In the list of faults, click a **fault date/name** to view the fault details.
3. If the fault condition has been resolved, click **Resolve**.  
Note that if the fault condition persists it will be detected in the future and re-diagnosed.
4. If the fault condition describes a configuration with a well-understood impact on the Delphix Engine that cannot be changed, you can ignore the fault by clicking **Ignore**.  
Note that an ignored fault will not be diagnosed again even if the underlying condition persists.

By default, when a **critical or warning fault** occurs, the Delphix Engine immediately sends an email to the Engine Administrator (**admin**). Make sure you have configured an SMTP server and defined an appropriate email address for Engine Administrator (**admin**). See [Initial Setup](#) for more information.

### **Critical or warning alert emails**

By default, emails will also be sent for **critical or warning alerts** (aka events). You can modify the default behavior by changing the alert profile with the CLI. See the [CLI Cookbook Creating Alert Profiles](#) for more information.

## Fault lifecycle example

Below is an image of the fault card for the fault "TCP slot table entries below the recommended minimum."

 **WARNING**

**Date**  
Dec 19, 2018 2:32 AM

**Title**  
TCP slot table entries below recommended minimum

**Target**  
bbdhcp-AHCI-58503.dcenter.delphix.com

**Details**  
The TCP sunrpc.tcp\_slot\_table\_entries property is currently set to '16' which is below the recommended minimum value of 128.

**User Action**  
Raise the sunrpc.tcp\_slot\_table\_entries value to at least 128.

 [Resolving and Ignoring](#) [Resolve](#) [Ignore](#)

The **Details** section of the fault explains that the sunrpc.tcp\_slot\_table\_entries property is set to a value that is below the recommended minimum of 128. The **User action** section instructs you to adjust the value of the sunrpc.tcp\_slot\_table\_entries property upward to the recommended minimum. The process for adjusting this property differs between operating systems. To resolve the underlying issue, search "how to adjust sunrpc.tcp\_slot\_table\_entries" using a search engine and find that the second result is a [link](#) to the Delphix community forum describing how to resolve this issue. After following the instructions applicable to your operating system, return to the Delphix UI and mark the fault **resolved**.

## Viewing system faults

### System events overview

The event log interface has been improved to provide filtering, sorting, and exporting.

The screenshot shows the Event Viewer interface. On the left, there are options for 'Predefined Range' (set to '1 Week') and 'Custom Range' (with 'From' and 'To' date pickers). The main area displays a table of events for the period 'Dec 26, 2018 2:38:51 PM - Jan 2, 2019 2:38:51 PM'. The table has columns: Timestamp, Severity, Target, Status, Description, and Event. Several rows are highlighted in yellow, indicating 'WARNING' severity. A 'Filter: None' dropdown is visible in the top right corner.

Event Viewer screen

As shown above, the **Event Viewer** window provides information about all the events that occurred for the selected time period. Text matching is limited to the following columns:

- Action
- Description

This screenshot shows the Event Viewer interface with a filter applied. The 'Severity' column header is highlighted with a blue box and labeled '3'. A search filter box in the top right contains the text 'Warning' and is labeled '1'. The table below shows only the rows where the severity is 'WARNING', which are highlighted in yellow. A blue circle labeled '2' is positioned near the top right of the table area.

Event Viewer screen filtered for warning events

In the **Event Viewer** window, you can:

Enter filter text to reduce the results to only those rows matching the text entered. In the example above, we are filtering for “warning.”

Click the **Export** button to export your results to a .csv file.

Click a column header to sort rows by the values found in that column.

The first time you click a header, rows will sort in ascending order. Clicking the same header a second time will sort the rows in descending order. Clicking the same header a third time will restore the results to their default sort order.

## Procedure

1. Launch the **Delphix Management** application.
2. Click **System**.
3. Select **Events**.
4. Select a time range.

## Sorting and filtering

Optional: You can enter filter text to reduce the results to only those rows matching the text entered.

Text matching is limited to the following columns:

- Severity
- Status
- Description

You can click on a table column header to sort rows by the values found in that column.

The first time you click a header, rows will sort in ascending order. Clicking the same header a second time will sort the rows in descending order. Clicking the same header a third time will restore the results to their default sort order.

Click the page navigation buttons to advance through large result sets.

## Column resizing and tooltips

If you wish, you can resize column widths to better fit the data to the available screen space. To resize a column:

1. Hover the mouse over a column separator found in the header. This will cause the mouse pointer to change shape.
2. Click and drag and the column separator to the desired position. Dragging to the left will reduce the column width. Dragging to the right will increase the width.
3. Release the mouse button.

The screenshot shows the 'Audit' section of the Delphix Management application. On the left, there is a sidebar with 'Predefined Range' set to '1 Hour' and 'Custom Range' options. The main area displays a table for the time range 'Jan 2, 2019 1:45:54 PM - Jan 2, 2019 2:45:54 PM'. The table has columns for 'Timestamp', 'User/Policy', 'Action', and 'Description'. A tooltip with a blue arrow points to the separator between the 'Action' and 'Description' columns, containing the text: 'To change the width of a column, hover over the column separator.' A search box with 'USER\_LOGIN' and a refresh icon is visible in the top right corner.

Timestamp	User/Policy	Action	Description
Jan 2, 2019 2:23:14 PM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 1:47:13 PM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".

Alternatively, you can auto-size a column to fit the widest value of the current page:

1. Hover the mouse over a column separator found in the header. This will cause the mouse pointer to change shape.
2. Double click the column separator.

Values that do not fit within their column will be truncated with an ellipsis (...). Hover the mouse over any value to see a tooltip rendering the complete, non-truncated value.

Jan 2, 2019 1:53:09 PM - Jan 2, 2019 2:53:09 PM

Filter: None 

Hover over a description  
to see a tooltip

Timestamp	User/Policy	Action	Description
Jan 2, 2019 2:40:30 PM	Refresh	DB_SYNC	Run SnapSync for database "Shield DB 2.0".

Click the **Export** button to download the current page of results to a file of comma-separated values (CSV).

## Accessing audit logs

This topic describes how to access audit logs. The audit log provides a record of all actions that were initiated by a policy or user, regardless of whether that action was successful.

### Overview

Audit logs provide a record of all actions that were initiated by a policy or user, regardless of whether that action was successful. The audit log interface has been improved to provide filtering, sorting, and exporting.

**Audit**

Audit window filtered for User events

Enter filter text to reduce the results to only those rows matching the text entered. In the example above, we are filtering for “user.”

Click the **Export** icon to export your results to a .csv file.

You can click a column header to sort rows by the values found in that column.

The first time you click a header, rows will sort in ascending order. Clicking the same header a second time will sort the rows in descending order. Clicking the same header a third time will restore the results to their default sort order.

 Actions displayed in the Actions panel or on the Audit page are kept forever.

### Procedure

1. Login to the **Delphix Management** application using **admin** credentials.
2. Click **System**.
3. Select **Audit**.
4. Select an audit log time range.

### Sorting and filtering

The screenshot shows the 'Audit' page with a table of log entries. The table has columns for 'Timestamp', 'User/Policy', 'Action', and 'Description'. A filter box at the top right contains the text 'USER\_LOGIN'. An 'Export' icon is visible in the top right corner. The table contains several rows of log entries, all with the action 'USER\_LOGIN'.

Timestamp	User/Policy	Action	Description
Jan 2, 2019 2:23:14 PM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 1:47:13 PM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".
Jan 2, 2019 1:42:44 PM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 1:37:03 PM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".
Jan 2, 2019 12:56:18 PM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 11:01:30 AM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".
Jan 2, 2019 10:52:08 AM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 10:31:20 AM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".
Jan 2, 2019 9:51:04 AM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".

 Enter filter text (e.g. USER\_LOGIN) to reduce the results to only those rows matching the text entered.

 Click the **Export** icon to export your results to a .csv file.

 You can click on a table column header to sort rows by the values found in that column. The first time you click a header, rows will sort in ascending order. Clicking the same header a second time will sort the rows in descending order. Clicking the same header a third time will restore the results to their default sort order. Text matching is limited to the following columns:

- Action
- Description

Click the page navigation buttons to advance through large result sets.

### Column resizing and tooltips

If you wish, you can resize column widths to better fit the data to the available screen space. To resize a column:

1. Hover the mouse over a column separator found in the header. This will cause the mouse pointer to change shape.
2. Click and drag and the column separator to the desired position. Dragging to the left will reduce the column width. Dragging to the right will increase the width.
3. Release the mouse button.

**Audit**

Predefined Range

1 Hour

Custom Range

From: Jan 2, 2019 1:45:54 PM

To: Jan 2, 2019 2:45:54 PM

Timestamp	User/Policy	Action	Description
Jan 2, 2019 2:23:14 PM	admin	USER_LOGIN	Log in as user "admin" from IP "172.16.116.59".
Jan 2, 2019 1:47:13 PM	sysadmin	USER_LOGIN	Log in as user "sysadmin" from IP "172.16.116.59".

USER\_LOGIN

↑

To change the width of a column, hover over the column separator.

Alternatively, you can auto-size a column to fit the widest value of the current page:

1. Hover the mouse over a column separator found in the header. This will cause the mouse pointer to change shape.
2. Double click the column separator.

Values that do not fit within their column will be truncated with ellipses (...). Hover the mouse over any value to see a tooltip rendering the complete, non-truncated value.

## Creating support logs

This topic describes how to create support bundles and manage server access control for Delphix Support.

Support bundles are used by Delphix as diagnostic tools for resolving Delphix Engine issues and routine maintenance. Support bundles can be transferred directly to Delphix Support or downloaded. No customer-specific data is included in the support bundle information. All passwords and personal data are either encrypted or omitted. This is an outbound-only connection from the Delphix Engine.

### Using the GUI

1. Log into the **Delphix Management** appliance as an Engine administrator.
2. Click **Help**.
3. Select **Support Logs**.
4. The **Support Bundle** dialog appears.

5. Select **Download** or **Transfer**.
  - a. If you select **Download**, then the support logs will be downloaded as a compressed ".tar" file into a folder on your workstation.
  - b. If you select **Transfer**, then the support logs will be uploaded over HTTPS to Delphix Support. If you have configured an HTTP Proxy, it will be used to send the support logs.

- c. If there is a support case involved, then please enter the case number to associate the logs to the case.
6. Click on **Show advanced** and select **Analytics**. This will include all the analytics data (default, up to 10MB) in the Support Bundle.
7. Click **OK**.
  - a. If you selected **Download** and have the compressed ".tar" file in a folder on your workstation, please **upload** that file to Delphix Support via the website at <http://upload.delphix.com>.
  - b. If there is a support case involved, then please enter the case number (again) to associate the logs to the case.

You can also access support log functionality in the **ServerSetup** application using **sysadmin** credentials. Click **Support Bundle** in the top menu bar.

## Using the CLI

1. ssh into your Delphix Engine.

```
ssh <sysadmin_user>@<delphixengine>
```

2. Run the upload operation.

```
delphix > service  
delphix service > support  
delphix service support > bundle  
delphix service support bundle > upload
```

3. Commit the operation.

```
delphix service support bundle upload *> commit
```

## Setting support access control

This topic describes how to set the Support Access Control for Delphix Support. Support access control enables Delphix Support to access your instance of the Delphix Engine for a defined period of time using an access token.

1. Log into the **Delphix Setup** application using **sysadmin** credentials.
2. Click **Server Preferences**.
3. Select **Support Access**.
4. Click **Enable**.
5. Set the time period during which you want to allow Delphix Support to have access to your instance of the Delphix Engine.
6. Click **Generate Token**.  
Provide the token to Delphix Support to enable access to your server.

## Setting syslog preferences

Syslog is a widely used standard for message logging. It permits the separation of the software that generates messages, the system that stores them, and the software that reports and analyzes them. Delphix makes use of Syslog as one of the standard mechanisms, along with SNMP and email, to distribute important user and system events, such as alerts, faults, and audits. In the case of Delphix, each Delphix Engine acts as a Syslog client which propagates the events to a centralized Syslog server.

The network protocol over which the Delphix Engine communicates with the Syslog server is standardized in [RFC 5424](#). As a protocol, it supports using either UDP ([RFC 5426](#)) or TCP ([RFC 6587](#)) as the underlying transport and optional TLS mapping has been introduced to encrypt the messages over the wire for security purposes ([RFC 5425](#)). However, as of this release, we only support Syslog over UDP with no encryption, which implies that Syslog messages are always sent in the clear and may be lost during transmission and delivered out of order due to the limitations of UDP.

To configure for Syslog support, you must specify the communication endpoint to which the Syslog server listens, which includes the hostname or IP address of the Syslog server and an optional port number. The latter defaults to 514 according to the Syslog standard but it can be changed if necessary.

System and user events generated by Delphix are always forwarded immediately to the Syslog server, which ensures the timely delivery of important events that may require immediate action.

A couple of different output formats are supported for messages delivered over Syslog, namely, TEXT and JSON. The TEXT format is the default. To change the message format, as of this release, you must do so via the CLI.

1. Log into the **Delphix Setup** application using **sysadmin** credentials.
2. Select **Preferences > Syslog Configuration**.

3. Select the severity level of the messages you want to be sent to the Syslog server.
4. Click the **pencil** icon next to **Syslog Servers** and then in the **Syslog Configuration** window select the plus icon.
5. Enter the Syslog server hostname/IP address and port number.

## Syslog Configuration

### Syslog Severity

Save

6. Select **Enable Syslog**.
7. Click **Save**.

## Severity levels for syslog messages

This topic discusses the Syslog reporting feature of the Delphix Engine, along with severity levels.

Syslog is a widely used standard for message logging. It permits the separation of the software that generates messages, the system that stores them, and the software that reports and analyzes them. Delphix makes use of Syslog as one of the standard mechanisms, along with SNMP and email, to distribute important user and system events, such as alerts, faults, and audits. In the case of Delphix, each Delphix Engine acts as a Syslog client which propagates the events to a centralized Syslog server.

Every Syslog message is attached to a severity level. As the name suggests, the severity level describes the severity of the event in question.

### Audit Logs

Audit records are Informational Syslog messages. If you would like to forward Audit records, choose Severity Level Informational.

### Severity levels

Every Syslog message is attached to a severity level number. Delphix defines the severity of Syslog messages in accordance with RFC 3164. There are eight severity levels available, as follows:

Numerical Code	Severity
0	Emergency: system is unusable
1	Alert: action must be taken immediately
2	Critical: critical conditions
3	Error: error conditions
4	Warning: warning conditions
5	Notice: normal but significant condition
6	Informational: informational messages
7	Debug: debug-level messages

When setting up the Syslog settings for your Delphix Engine, you have the ability to choose what alerts to report. The severity levels above are available for users to select. Once you select a severity level, the Delphix Engine will send messages of the same or higher severity (i.e., the same or lower number) to your Syslog server. Therefore, there is no reason to select more than one severity. For example, if the "Notice" severity level is selected, all events less severe than Notice (Informational and Debug) will not be reported. If you want all events to be reported via Syslog, the Debug severity level should be chosen.

## Support access audit logs

This topic describes how terminal session audit logging works within the Delphix OS. These logs contain keystroke by keystroke recordings of all terminal activity during a given shell session initiated by a super user (Delphix support).

### Overview

Super user activity by Delphix support is recorded to an individual log file for each shell session. Each log file is named using the format **session\_<shell user ip>\_<epoch timestamp>**. The contents of the logs include commands entered into the shell and the output of those commands. Timestamps are additionally prepended to each line of the log to facilitate assessing the timeline of events.

 Session logs created during a super user shell session are kept forever unless deleted by a Delphix engine SYSTEM user.

### Listing the session audit logs

Super user session logs can be reviewed/deleted through the CLI or API and downloaded through the API only. Any DOMAIN or SYSTEM user can list the current logs or download a given log file but only SYSTEM users can delete them. To review a list of the session logs currently present on a Delphix engine:

1. Login to the **Delphix CLI** using **admin** or **sysadmin** credentials.
2. Navigate to **superuser session** and press enter.
3. Use **list** or **ls** to view the files.

```
ip-12-345-678-90 superuser session> ls
Objects
NAME                                IPADDRESS      STARTTIMEUTC
DURATION
session_123.45.678.90_1686923517171 123.45.678.90 2023-06-16T13:51:57.171Z 20sec
session_123.45.678.90_1686923559856 123.45.678.90 2023-06-16T13:52:39.856Z 439sec
session_123.45.678.90_1686924008788 123.45.678.90 2023-06-16T14:00:08.788Z 87sec
```

Here is an example of calling the list API directly using curl:

```
curl -b ~/cookies.txt -X GET "http://mydelphixengine.myorg.com/resources/json/delphix/superuser/session"
```

### Downloading a session audit log

Any DOMAIN or SYSTEM user can download a super user session log file via the Delphix API. Here is an example of calling the download API using curl:

```
curl -v -O -J "http://mydelphixengine.myorg.com/resources/json/delphix/superuser/session/download?sessionLogName=session_123.45.678.90_1686923517171" -b ~/cookies.txt
```

## Reviewing a session audit log

It is recommended that session logs be viewed through a program such as **cat**, which is capable of interpreting control characters. This is because the logs not only include key strokes and terminal output, but also the control characters that dictate how that output was formatted and displayed, ensuring that the logs reflect what was actually seen during the shell session as accurately as possible. It is also possible to view the logs using any text editor, but in most cases this will be more difficult to read because the control characters themselves will be visible. Here is a snippet from a brief session log as it might be displayed by **cat**:

```
[2023-06-16T13:52:28.061Z] delphix:~$ echo testing 123
[2023-06-16T13:52:28.062Z] testing 123
[2023-06-16T13:52:30.599Z] delphix:~$ exit
```

Note that each line of the log includes a timestamp. This timestamp is prepended to each line as the log is written. It is not from the session terminal output, but rather is provided to more conveniently assess the timeline of a given session. The timestamp is generated in the instant before a given command is executed rather than when the prompt was first printed to the terminal to maximize its accuracy.

## Limitations

Shell activity that involves opening a pager or buffer (e.g. **less**, **more**, **vi**, etc.) may not be fully reflected in the session log, though the command that initiates the pager/buffer will be present. For example, if a super user opens a file in **vi** for editing, the line to open the file would be present, followed by the next command run after **vi** was closed.

## Deleting a session audit log

These audit logs are meant to live as long as they are needed, and thus are not governed by a retention policy. Should you wish to delete a log this can be done by SYSTEM users only through the Delphix CLI or API. To use the CLI:

1. Login to the **Delphix CLI** using **sysadmin** credentials.
2. Navigate to **superuser session** and press enter.
3. Review the current log files using **list** or **ls**
4. Select the log file that you wish to delete.
5. Use **list** or **ls** to review the log details and confirm this is the log you want to delete.
6. Type **delete** and press enter.
7. Type **commit** and press enter to delete the log.

```
ip-12-345-678-90 superuser session> select "session_123.45.678.90_1686923517171"
ip-12-345-678-90 superuser session 'session_123.45.678.90_1686923517171'> ls
Properties
  type: SuperuserSession
  name: session_123.45.678.90_1686923517171
  duration: 20sec
  ipAddress: 123.45.678.90
  reference: SUPERUSER_SESSION-session_123.45.678.90_1686923517171
  startTimeUTC: 2023-06-16T13:51:57.171Z
```

```
Operations
delete
```

```
ip-12-345-678-90 superuser session 'session_123.45.678.90_1686923517171'> delete
ip-12-345-678-90 superuser session 'session_123.45.678.90_1686923517171' delete *>
commit
ip-12-345-678-90 superuser session> ls
Objects
NAME                                IPADDRESS          STARTTIMEUTC
DURATION
session_123.45.678.90_1686923559856 123.45.678.90     2023-06-16T13:52:39.856Z 439sec
session_123.45.678.90_1686924008788 123.45.678.90     2023-06-16T14:00:08.788Z 87sec
```

The delete API can also be called directly. Unlike the download API, delete requires the session log reference, which is always SUPERUSER\_SESSION-<log name>. Here is an example of calling the delete API using curl:

```
curl -X POST "http://mydelphixengine.myorg.com/resources/json/delphix/superuser/
session/SUPERUSER_SESSION-session_123.45.678.90_1686923517171/delete" -b ~/cookies.tx
t
```

## Diagnosing connectivity errors

Prior to the 5.1 release, when the Delphix Engine ran into an error operating on an external database or environment, it reported the immediate error that it had encountered; there was no mechanism for automatic analysis of the root causes of failures. The 5.1 release included infrastructure for automatic diagnosis of errors. When one of these errors occurs, the Delphix Engine now launches a set of tests to locate the root cause of the problem and present the result of the diagnosis. This will help you easily identify the true sources of errors such as closed ports or misconfigured router.

### Failed actions

The Delphix Engine communicates failures in two different manners: actions that fail to complete, and faults. To view failed actions:

1. In the top right-hand corner of the Delphix Management application, click **Actions**.
2. For more information about why the action failed, click the (i) icon to show the error dialog.

The following shows a popup message with more information about the problem and what actions to take to resolve it. For some errors, the Delphix Engine will be able to diagnose the problem further and display this extra information under **Diagnosing Information**. In the screenshot above, the job failed because the Delphix Engine was unable to lookup the host address.

### Create environment "bigprovision.delphix.com".

✕

**Error**  
Failed to add host "bigprovision.delphix.com" because it belongs to another host environment "bigprovision".

**Error Code**  
exception.host.host.already.exists

**Suggested Action**  
Make sure that you are not trying to create duplicate host environments.

OK

## Viewing active faults

A fault symbolizes a condition that can affect the performance or functionality of the Delphix Engine and must be addressed. Faults can be either warnings or critical failures that prevent the Delphix Engine from functioning normally. For example, a problem with a source or target environment can cause SnapSync or LogSync policy jobs to fail. Faults will show up as active as long as:

- The error is still occurring, or
- You have chosen to manually resolve it or ignore it

For example, if a background job fails, it will create a fault that describes the problem. To view any active faults:

- In the top right-hand corner of the Delphix Management interface, click **Faults**.

This brings the Faults screen listing all active faults.

Faults

< < Page 1 of 1 > >

**▲ WARNING**

**Date**  
Sep 29, 2021 12:43 PM

**Title**  
Incorrect toolkit owner

**Target**  
hana-virtual-tgt.dlpxdc.co

**Details**  
The owner of the Delphix toolkit installation directory '/var/tmp' is not 'hdbadm'.

**User Action**  
Check the owner of the toolkit directory.

Resolving and Ignoring

Resolve
Ignore

The screenshot above illustrates a fault with regard to a failure to a TCP slot table entry. The Delphix Engine will mark an object with a warning triangle to indicate that it is affected by an external problem. You can view more details of the fault by looking at the active faults and their fault effects.

## Email (SMTP) alert notifications

### Overview

The configuration for SMTP-based alert notifications has two components:

- The configuration of an SMTP gateway by the Delphix system administrator
- The configuration of one or more alert profiles (if needed)

### Configuring the SMTP gateway

Before email-based alerts can function properly, many organizations require that an SMTP gateway is configured, through which all outbound email is sent.

1. Contact the appropriate administrator for your site in order to determine the SMTP gateway settings.
2. Login to the **Delphix setup** application as **sysadmin** or another user with system administrator privileges.
3. On the Dashboard screen, locate the **Outbound connectivity** section, and click **modify**.   
*Outbound Connectivity for SMTP Gateway*
4. If not checked already, check the box next to **Use an existing SMTP server**.

### Outbound Connectivity

---

**WEB PROXY**  
The Web Proxy Server will be used to communicate with Delphix Corp. for support, troubleshooting, upgrades, updates, and patches.

Configure web proxy

**PHONE HOME SERVICE**  
If enabled, this service will automatically send a minimal support bundle once a day to the Delphix support site over HTTPS. This will help with future support and troubleshooting. A connection to the internet, either directly or via web proxy is required.

Enable phone home service

**USER-CLICK ANALYTICS**  
If enabled, this service will automatically send a stream of anonymous, non-personal metadata describing user interaction with the product's user interface. This data will help us to better understand how our products are being used, and to improve our products and services.

Enable Usage Analytics

**SMTP**  
Configure the Delphix Engine's SMTP sending service to enable email notifications. Your sysadmin email will be used for receiving system reports, events, and fault notifications.

Use an existing SMTP server  
Enable email notifications for faults and events

Server Name or IP Address	Port 25
---------------------------	------------

TLS Authentication

SMTP Authentication

From Email Address

SMTP Send Timeout  
  
Maximum timeout to wait, in seconds, when sending mail.

Test Email Address  
  
Comma-separated list of Test Email Address

5. At a minimum, enter the required information:
  - a. SMTP Server Name or IP Address
  - b. SMTP port
  - c. From Email Address This will be the email address from which all alert emails will be sent.
6. In **Test Email Address**, enter the same email address to verify that you are able to receive email properly.
7. Click **Save** to save changes.

For further information, see the “Outbound Connectivity” section of [Initial Setup](#)

## Alert profiles

The Delphix Engine can send out email notifications when alerts happen. Alert profiles control this functionality.

An alert profile is composed of two things:

- **Filter Specification:** A filter, or combination of filters, that specifies which alerts are of interest.
- **Alert Action:** This specifies the email addresses to which the Delphix Engine will send an email when an alert matches the filter specification.

By default, the Delphix Engine has a single alert profile configured with the following parameters:

- Filter Specification: Match any alert with a severity level of **CRITICAL** or **WARNING**.
- Alert Actions: Send an email to the address defined for user **admin**.

### Default domain user

The default domain user created on Delphix Engines is now **admin** instead of `delphix_admin`. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling `delphix_admin`.

Using the CLI, it is possible to:

- Modify the system default alert profile
- Create additional profiles in addition to the default one
- Set multiple actions for a single profile, such as "email `delphix_admin`" and "email `user1@mycompany.com`".

## Simple filters

- Filtered by Owner of alerts target – for example, objects owned by user 1

## Complex filters

Complex filters combine/modify other sub-filters:

- “And” filter – Used when all conditions defined must be met for the filter to notify the user with an email
- “Or” filter – Used when either one or the other of the conditions defined in the filters must be met for the filter to notify the user with an email
- “Not” filter – Used to exclude items

## Limitations

- This is a CLI feature.
- Alert Profiles do not override permission settings. If you do not have Read permission on an object then your alert profile will never get triggered for that object's alerts, regardless of your filter settings.

The following CLI examples will run through how to create these three filters. Each example provides three different methods of setting up a profile. These include the following:

- A simple profile
- A profile with two filters

- A complicated profile

For more information, see [CLI Cookbook: Creating Alert Profiles](#)

## A simple profile

A simple profile approach matches the Delphix out-of-the-box default alert profiles. To create a simple alert profile using the CLI as seen in the figure below, go into the alert profile section of the command-line interface (CLI) and create a new profile. Line four prompts the engine to send an email when the filters are triggered. The following three command lines refer to the filter specifications. Follow two severity levels: warning and critical. This will trigger an email alert when any warning or critical events occur.

```
delphix > cd alert
delphix alert > cd profile
delphix alert profile > create
delphix alert profile create > set actions.0.type=AlertActionEmailUser
delphix alert profile create > set filterSpec.type=SeverityFilter
delphix alert profile create > set filterSpec.severityLevels.0=CRITICAL
delphix alert profile create > set filterSpec.severityLevels.1=WARNING
delphix alert profile create > commit
```

*Simple Alert Profile example in the CLI*

## A compound alert profile

Creating a compound alert profile in the CLI will combine two filters together. This profile triggers an email about any alert on objects owned by the delphix\_admin plus any other alert that is critical. The compound alert profile creates two filters. The first one will be the target owner filter, which in this case is **admin**. The second filter is the severity filter, allowing users to match anything that is critical. Combine these two filters using the OR logic so that if any of the sub-filters match, the whole filter matches. An example of this can be seen in the figure below.

*Alert Profile using OR logic*

While working in the CLI, the first four lines describe a simple alert profile. The distinction between simple and compound alert profiles is that in a compound profile, the top-level filter uses an OR filter with sub-filters for target owner and severity level, as seen in line five of the figure below.

```
delphix > cd alert
delphix alert > cd profile
delphix alert profile > create
```

```

delphix alert profile create > set actions.0.type=AlertActionEmailUser
delphix alert profile create > set filterSpec.type=OrFilter
delphix alert profile create > set filterSpec.subFilters.0.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.subFilters.0.owners.0=delphix_admin
delphix alert profile create > set filterSpec.subFilters.1.type=SeverityFilter
delphix alert profile create > set filterSpec.subFilters.1.severityLevels.0=CRITICAL
delphix alert profile create > commit

```

### A Compound Alert Profile

## Complex alert profile

A complex alert profile uses the profile filter created in the compound alert profile and modifies it. For the example shown in the figure below, you have a VDB named `test_instance` that you do not need any emails about. The following commands will create an effective filter.

1. Create an OR filter with two sub filters: target owner and event type.
2. Create a NOT filter that will exclude the VDB (`test_instance`) from which you do not want to receive notifications.
3. Use the AND logic to combine all these filters together, as seen below.

### Complex Alert Profile

Below is an example of the command lines used to set up this complex profile.

```

delphix > cd alert
delphix alert > cd profile
delphix alert profile > create
delphix alert profile create > set actions.0.type=AlertActionEmailUser
delphix alert profile create > set filterSpec.type=AndFilter
delphix alert profile create > set filterSpec.subFilters.0.type=NotFilter
delphix alert profile create > edit filterSpec.subFilters.0.subFilter
delphix alert profile create filterSpec.subFilters.0.subFilter > set
type=TargetFilter
delphix alert profile create filterSpec.subFilters.0.subFilter > set targets.0=test_i
nstance

```

```

delphix alert profile create filterSpec.subFilters.0.subFilter > back
delphix alert profile create > set filterSpec.subFilters.1.type=OrFilter
delphix alert profile create > set filterSpec.subFilters.1.subFilters.0.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.subFilters.1.subFilters.0.owners.0=delphix_admin
delphix alert profile create > set filterSpec.subFilters.1.subFilters.1.type=SeverityFilter
delphix alert profile create > set filterSpec.subFilters.1.subFilters.1.severityLevels=CRITICAL
delphix alert profile create > commit

```

### Complex Alert Profile CLI

#### Creating alert profiles

1. SSH into your engine's CLI using your delphix\_admin username and password

```
ssh delphix_admin@yourdelphixengine
```

2. Start creating your new profile. After logging in to get to the alert section enter alert.

```

delphix > alert
delphix alert > profile
delphix alert profile > create
delphix alert profile create > ls

```

3. Set Action(s) Use **AlertActionEmailList** if you want to specify a list of email addresses for this profile.

```

delphix alert profile create > set actions.0.type=AlertActionEmailList
delphix alert profile create > set actions.0.addresses.0=<email address to send to>
delphix alert profile create > set actions.0.addresses.1=<additional email address>
delphix alert profile create > set actions.0.addresses.2=<additional email address>

```

Or, use **AlertActionEmailUser** if you just want the emails to go to the email address associated with this Delphix user.

```
delphix alert profile create > set actions.0.type=AlertActionEmailUser
```

It is possible to add more than one action here, so you may use both **AlertActionEmailList** and **AlertActionEmailUser** if desired.

4. Set filter Here is an example of setting a simple severity filter. With this filter, emails will be sent for any **CRITICAL** or **WARNING** alerts.

```

delphix alert profile create > set filterSpec.type=SeverityFilter
delphix alert profile create > set filterSpec.severityLevels.0=CRITICAL

```

```
delphix alert profile create > set filterSpec.severityLevels.1=WARNING
```

Here is an example of setting a simple target-owner filter. With this filter, emails will be sent for any alert whose target is owned by delphix\_admin.

```
delphix alert profile create > set filterSpec.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.owners.0=delphix_admin
```

Here is an example of a compound filter. With this filter, we combine the above two filters – an email is sent when an alert is **CRITICAL** or **WARNING**, and the alert's target is owned by delphix\_admin.

```
delphix alert profile create > set filterSpec.type=AndFilter
delphix alert profile create > set filterSpec.subFilters.0.type=SeverityFilter
delphix alert profile create > set filterSpec.subFilters.0.severityLevels.0=CRITICAL
delphix alert profile create > set filterSpec.subFilters.0.severityLevels.1=WARNING
delphix alert profile create > set filterSpec.subFilters.1.type=TargetOwnerFilter
delphix alert profile create > set filterSpec.subFilters.1.owners.0=delphix_admin
```

5. Commit your changes

```
delphix alert profile create > commit
```

Profile filters

As seen above, you can use different filter types to customize which alerts the Delphix Engine will send emails about. The various filter types are listed below.

Simple filters

Filter type	Purpose	Example	Allowed Values
SeverityFilter	Match based on the alert's severity level (critical, warning, informational)	severityLevels.0=CRITICAL severityLevels.1=WARNING This would match any alert whose severity level is CRITICAL or WARNING.	1 or more of: <ul style="list-style-type: none"> <li>CRITICAL</li> <li>WARNING</li> <li>INFORMATIONAL</li> </ul>
EventFilter	Match based on the alert's event type.	eventTypes.0=fault.* This would match any alert that is generated due to a newly-raised fault on the engine.	One or more text entries, optionally using the * wildcard.

Filter type	Purpose	Example	Allowed Values
TargetFilter	Match based on the alert's target.	targets.0="Group/DB" This would match any alert whose target is the database "DB" located in the group "Group".	Any object in the system. 1 or more objects may be specified.
TargetOwnerFilter	Match based on the owner of the alert's target.	owners.0=delphix_admin This would match any alert whose target's owner is the <b>delphix_admin</b> user.	Any user in the system. 1 or more users may be specified.

### Compound filters

These filters combine/modify the behavior of other filters, called "subfilters". The subfilters may be of any type (simple or complex).

Filter Type	Purpose	Number of subfilters required
AndFilter	This filter matches if <b>all</b> subfilters match	2 or more
OrFilters	This filter matches if <b>any</b> subfilter matches.	2 or more
NotFilter	This filter matches if the subfilter does <b>not</b> match.	1

### Action types

With the AlertActionEmailUser type, notification emails will be sent to the email address of the user who owns the alert profile.

With the AlertActionEmailList type, a list of email addresses must be specified in the "addresses" array. Notification emails will be sent to these addresses.

### Email format options

You can send plain text as well as structured JSON. JSON can be useful for constructing solutions that will parse the email and perform further actions (notify, escalate, log).

To change the format, while updating an alert profile:

```
delphix alert profile ALERT_PROFILE-X update > set actions.0.format=<JSON|TEXT>
```

## Splunk integration

Delphix enables self-monitoring/diagnosability of Delphix Engines by providing native integration with Splunk Enterprise. By providing details about your Splunk instance, you can allow Delphix to send structured JSON logs to Splunk that capture activity on the Delphix engine(s). These logs include Delphix events (Actions, Job Events, Faults, and Alerts) as well as performance metrics (CPU, disk, network, TCP, dataset, NFS, iSCSI) and capacity metrics. Delphix Insight enables extensible search and visualization of actionable information and provides a centralized, comprehensive view of Delphix activity (including the ability to cross-reference information from multiple Delphix engines) on a platform that allows building your own operational intelligence for your Delphix installation.

This section covers the following topics:

- [Configuring splunk](#)
- [Using search](#)

## Configuring splunk

### Prerequisites

Before you configure the Delphix Engine you will need to configure and make a note of the following in Splunk:

 Please refer to the [Splunk documentation](#) for detailed steps on how to configure your values.

 **Supported Splunk versions**  
Delphix only supports Splunk Enterprise 6.3.0 or higher.

1. In the Splunk web **UI Enable SSL** (this is optional but best practice for security) in your global HTTP Event Collector (HEC) settings.
2. The **Splunk hostname** or **IP Address**.
3. The **HEC Port** number for your Splunk instance (default 8088).
4. Enable the HTTP Event Collector on Splunk, and create a new **HEC Token** with a new Splunk index set as an allowed index for the token. Make sure **Enable Indexer Acknowledgement** is **unchecked** for the token.  
**Warning** : If you wish, you can use a separate Splunk index for performance and capacity metrics (otherwise, the same index will be used for both events and metrics). If you are using Splunk 7.0+, it is recommended that you create this second index as a special “Metrics” type index that is optimized for indexing and searching metrics data.
5. Note the **HEC Token Value** and the **Allowed Indexes** for the token.

The following table provides an example of the data you will need.

Attribute	Sample data
Splunk Server IP address	192.168.8.8
Splunk Server HEC Port Number	8088
Splunk HEC Token	12345678-1234-1234-1234-1234567890AB
Index Name for Events	delphix_events
Index Name for Metrics	delphix_metrics

### Configuring Delphix for Splunk

1. Log in to the **Delphix Server Setup UI** as the sysadmin.
2. From the **Preferences** menu select **Fluentd Configuration**.
3. In the Fluentd Configuration window, enter your Splunk values, using the default **splunkHec** plugin configuration.

## HTTP Event Collector Configuration

Settings are used to send Delphix Insight data to Splunk HTTP Event Collector (HEC). Delphix Insight data includes Actions, Job Events, Faults, and Alerts.

Enable Splunk Configuration

### Host

### HEC Port

### HEC Token

### Main Index ?

### Events Push Frequency (seconds)

Enable SSL (Must match HEC settings in Splunk)

## Metrics

Additionally send performance and capacity metrics data to Splunk if enabled.

Enable Metrics

### Metrics Index ?

### Metrics Push Frequency (seconds)

### Performance Data Granularity ?

### Test Connection

Send test data to validate current configuration.

**Send Test Data**

**Cancel**

**Save**

Host	Splunk hostname or IP address
HEC Port	The TCP port number for the Splunk HTTP Event Collector (HEC)
HEC Token	The token for the Splunk HTTP Event Collector (HEC)
Main Index	The Splunk Index events will be sent to. It must be set as an allowed index for the HEC token.
Events Push Frequency	The frequency at which the Events will be pushed to Splunk. Specified in seconds.
Enable SSL	Whether to use HTTPS to connect to Splunk. Must match your HTTP Event Collector settings in Splunk.
Metrics Index	The Splunk Index metrics will be sent to. If none is specified then the Main Index will be used for metrics as well. It must be set as an allowed index for the HEC token.
Metrics Push Frequency	The frequency at which the Performance Metrics will be pushed to Splunk. Specified in seconds
Performance Data Granularity	The resolution of performance metrics data sent to Splunk. This controls the granularity of system performance metric values sent to Splunk. For example: Setting this to "Per Minute" results in a system performance metric to have a per-minute aggregated value (as collected by the analytics subsystem of the Delphix Engine) instead of a per-second value.

**⚠ Reducing the volume of data**  
To reduce the volume of data that will be sent to Splunk, you can change the Performance Data Granularity to Per Minute or uncheck Enable Metrics.

4. Click **Send Test Data** to verify your provided values. This will send a test event to the provided token and indexes.

5. Click **Save** to enable the Splunk configuration and begin sending all new Actions, Job Events, Faults, Alerts, and Metrics to your Splunk instance.

## Using search

Use the search to analyze your data and enumerate items in a metrics index. For more about searching a metrics index, refer to the [Splunk](#) documentation.

### Search examples - Metrics

The following examples provide information on viewing Metrics on Splunk 7.x

To get a list of all Metrics:

```
| mcatalog values(metric_name)
```

To get a list of all dimensions of a given metric - say CPU utilization percentage:

```
| mcatalog values(metric_name)
```

To view the average values of overall CPU utilization percentage across all hosts with a span of 30 seconds:

```
| mcatalog values(metric_name)
```

You can also display results in a chart with CPU wildcard:

```
| mstats perc85(_value) AS val85 avg(_value) AS val where metric_name="system.cpu.*"
span=1s by data.kernel, data.user, data.idle
| eval total='data.kernel' + 'data.user' + 'data.idle'
| eval sys_pct=((('data.kernel'/total) * 100)
| eval usr_pct=((('data.user'/total) * 100)
| eval idle_pct=((('data.idle'/total) * 100)
| timechart span=10m avg(val) as "cpu.overall", avg(val85) as "cpu.overall 85th
Percentile", avg(sys_pct) as "cpu.system", avg(usr_pct) as "cpu.user", avg(idle_pct)
as "cpu.idle"
```

This type of search can be used to stack different CPU metrics that add up to 100%. Here is a sample screenshot of the above “stack different CPU metrics” from the Delphix Engines.

Search examples - events

The following queries demonstrate some basic visualizations of various Delphix events. The **delphix\_index** value should be replaced with the name of the **Main Index** provided in during Delphix Setup. These examples serve as useful starting points that can be expanded to include other relevant data. See [Events Format](#) for a full description of the structure of each type of event.

Display event statistics per host

Search

```
index="delphix_index" | stats
count(eval(source="delphix.events.action.completed" OR
source="delphix.events.action.started" OR
source="delphix.events.action.waiting" )) AS ACTIONS
count(eval(source="delphix.events.fault.posted")) AS FAULTS
```

```
count(eval(source="delphix.events.alert" )) AS ALERTS
count(eval(source="delphix.events.job.event" )) AS JOBS BY host
```

## Search examples - event formats

The Actions, Job Events, Faults, and Alerts that Delphix sends to Splunk are structured according to predefined [JSON schemas](#)

## JSON schemas for events

The following set of [JSON schemas](#) define the shape of each Splunk event, including which properties are expected to exist for each event type and what those properties mean. Some of these .json files are used as shared building blocks to define the other schemas; the top-level schemas which define each distinct event type are **Action.json**, **Alert.json**, **JobEvent.json**, **Fault.json**, and **FaultEffect.json**.

Below key-values are Splunk event metadata - This follows GeneralSplunkHeader.json - schema and GeneralSplunkEvent.json  
GeneralSplunkHeader.json

```
{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "type": "object",
  "properties": {
    "time": {
      "description": "The time the event was logged. The default time format is epoch time format, in the format <sec>.<ms>.",
      "type": "number"
    },
    "host": {
      "description": "The system's hostname. Will be the host value assigned to the event data in Splunk.",

```

```

        "type": "string"
    },
    "source": {
        "description": "For example mgmt.event.action. Will be the source value
to assigned to the event data in Splunk.",
        "type": "string"
    },
    "sourcetype": {
        "description": "The sourcetype value to assign to the event data.",
        "type": "string"
    },
    "index": {
        "description": "The name of the index by which the event data is to be
indexed.",
        "type": "string"
    }
},
"required": ["time", "host", "source", "sourcetype", "index"]
}

```

GeneralSplunkEvent.json

```

{
    "$schema": "http://json-schema.org/draft-04/schema#",
    "type": "object",
    "properties": {
        "systemUniqueId": {
            "description": "The UUID of the system.",
            "type": "string"
        },
        "systemVersion": {
            "description": "The release version of the system.",
            "type": "string"
        }
    },
    "required": ["systemUniqueId", "systemVersion"]
}

```

Action.json

```

{
    "$schema": "http://json-schema.org/draft-04/schema#",
    "definitions": {
        "ActionEvent": {
            "type": "object",
            "properties": {
                "reference": {
                    "description": "The object reference of the action.",
                    "type": "string"
                },
                "title": {
                    "description": "Action title.",

```

```

        "type": "string"
    },
    "details": {
        "description": "Plain text description of the action.",
        "type": "string"
    },
    "startTime": {
        "description": "The time the action occurred. For a long running
process, this represents the starting time.",
        "type": "string"
    },
    "endTime": {
        "description": "The time the action completed.",
        "type": "string"
    },
    "user": {
        "description": "The user who initiated the action.",
        "type": "string"
    },
    "userAgent": {
        "description": "Name of the client software used to initiate the
action.",
        "type": "string"
    },
    "originIp": {
        "description": "Network address used to initiate the action",
        "type": "string"
    },
    "parentAction": {
        "description": "The parent action of this action.",
        "type": "string"
    },
    "state": {
        "description": "State of the action",
        "type": "string"
    },
    "workSource": {
        "description": "Origin of the work that caused the action.",
        "type": "string"
    },
    "workSourceName": {
        "description": "Name of the user or policy that initiated the
action.",
        "type": "string"
    },
    "failureDescription": {
        "description": "Details of the action failure.",
        "type": "string"
    },
    "failureAction": {
        "description": "Action to be taken to resolve the failure",
        "type": "string"
    },
    },

```

```

        "failureMessageCode": {
            "description": "Message ID associated with the event.",
            "type": "string"
        }
    },
    "required": ["reference", "title", "details", "state"]
}
},
"type": "object",
"title": "Action",
"allOf": [{ "$ref": "GeneralSplunkHeader.json#" }],
"properties": {
    "event": {
        "type": "object",
        "allOf": [{ "$ref": "#/definitions/ActionEvent" }, { "$ref": "GeneralSplunkEvent.json#" } ]
    }
}
}
}

```

Alert.json

```

{
    "$schema": "http://json-schema.org/draft-04/schema#",
    "definitions": {
        "AlertEvent": {
            "type": "object",
            "properties": {
                "reference": {
                    "description": "The object reference of the alert.",
                    "type": "string"
                },
                "title": {
                    "description": "Title of the event which triggered the alert.",
                    "type": "string"
                },
                "code": {
                    "description": "Dotted descriptor of the type of event which triggered the alert.",
                    "type": "string"
                },
                "eventSeverity": {
                    "description": "The severity of the event.",

        },
        "targetName": {
          "description": "Name of the target object.",
          "type": "string"
        }
      }
    }
  }
}

```

```

        },
        "required": ["reference", "title", "code", "details", "timestamp"]
    },
    },
    "type": "object",
    "title": "Alert",
    "allOf": [{ "$ref": "GeneralSplunkHeader.json#" }],
    "properties": {
        "event": {
            "type": "object",
            "allOf": [{ "$ref": "#/definitions/AlertEvent" }, { "$ref": "GeneralSplunkEvent.json#" } ]
        }
    }
}

```

### Types of events

Delphix uses the **source** field in Splunk to designate the type of each event. Here is a full list of the possible values of the **source** field for events, along with an explanation of when each event is generated and the name of the corresponding JSON schema that describes the event structure.

source	Explanation	Schema
delphix.events.action.started	Action has started running.	Action.json
delphix.events.action.waiting	Action has moved to the WAITING state.	Action.json
delphix.events.action.completed	Action has completed successfully.	Action.json
delphix.events.action.failed	Action has failed.	Action.json
delphix.events.action.canceled	Action has been canceled.	Action.json
delphix.events.job.event	Job Event has been generated in response to a Job progress update.	JobEvent.json
delphix.events.fault.posted	Fault has been posted.	Fault.json
delphix.events.fault.resolved	Fault has been resolved.	Fault.json
delphix.events.fault.ignored	User has chosen to ignore a fault.	Fault.json

source	Explanation	Schema
delphix.events.fault.unignored	User has chosen to “unignore” a previously ignored fault.	Fault.json
delphix.events.fault.effect.posted	Fault Effect has been posted as a downstream effect of some Fault.	FaultEffect.json
delphix.events.fault.effect.resolved	Fault Effect has been resolved as a result of its cause being resolved.	FaultEffect.json
delphix.events.fault.effect.ignored	Fault Effect has been ignored when a user chose to ignore its cause.	FaultEffect.json
delphix.events.fault.effect.unignored	Fault Effect has been “unignored” when a user chose to unignore its previously ignored cause.	FaultEffect.json
delphix.events.alert	Alert has been posted.	Alert.json

Search examples - metric formats

JSON schemas for metrics

GeneralMetricEvent.json

```
{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "type": "object",
  "properties": {
    "systemUniqueId": {
      "description": "The UUID of the system.",
      "type": "string"
    },
    "systemVersion": {
      "description": "The release version of the system.",
      "type": "string"
    },
    "event": {
      "description": "A tag that indicates this Event is a metric.",
      "type": "string",
      "enum": ["metric"]
    }
  },
  "required": ["systemUniqueId", "systemVersion", "event"]
}
```

A schema that is common for all metrics, the “data” nested JSON object contents varies depending on the metric:

## CommonMetric.json

```

{
  "$schema": "http://json-schema.org/draft-04/schema#",
  "definitions": {
    "CommonMetric": {
      "type": "object",
      "properties": {
        "name": {
          "description": "The name of the metric.",
          "type": "string"
        },
        "time": {
          "description": "The timestamp of the metric when it was collected.
The default time format is epoch time format, in the format <sec>.<ms>.",
          "type": "number"

```

## Metrics format

Metrics Format is the combination of the two tables below (metadata + metric specific key-values).

JSON key	Value type	Description	Example	Comments
<b>source</b>	String	Dotted name hierarchy for insight source.	delphix.metrics.xyz	This is the “source” value assigned to an event data in Splunk.
<b>index</b>	String	Splunk metrics index name	insight_metrics	Splunk Index name
<b>host</b>	String	Hostname/IP	<a href="https://pks-insight.dc2.delphix.com">pks-insight.dc2.delphix.com</a>	Could also serve as a tag in other time-series data (like opentsdb)
<b>event</b>	<b><i>"metric"</i></b>	Describes what kind of event this is.	n/a	Signifies this Splunk event is a “Metric”.
<b>sourcetype</b>	<b><i>"_json"</i></b>	Data format	n/a	Used for Splunk Indexed field extractions
<b>systemUniqueId</b>	String	The UUID of the system	"423f22db-4ee9-6ebe-ff0f-884ffdc351f7"	
<b>systemVersion</b>	String	The release version of the system	5.2.5.0	

And the general key-values specific to an Insight metric are:

JSON key	Value type	Description	Example	Comments
<b>name</b>	String	Pseudo hierarchical dotted format of the metric name.	system.cpu.util.pct system.disk.ops.co unt <a href="#">system.net</a> .total.bytes	A metric name: <ul style="list-style-type: none"> <li>is alphanumeric (underscore &amp; dot allowed)</li> <li>has <i>prefix</i> that points to the source of the data (like <i>system.cpu</i>)</li> <li>has <i>suffix</i> that describes the unit (when it can) <ul style="list-style-type: none"> <li>an aggregate/summary metric would have <i>total</i> as part of suffix for example.</li> </ul> </li> </ul>
<b>time</b>	UNIX time notation (epoch)	Timestamp	1525399950	UNIX epoch time format.
<b>value</b>	Numeric value of the metric	The actual measurement	85.17 (system.cpu.util.pct)	Numeric only
<b>type</b>	String (Enum): <ul style="list-style-type: none"> <li>counter,</li> <li>gauge,</li> <li>summary</li> </ul>	Type of the measurement	counter   gauge   summary	This field could be used to identify what kind of value a metric is presenting (like a “gauge” for cpu metric implies the values will fall into a range of 0-100% - similarly a “summary” would imply the value is an “accumulated value” like network utilization )
<b>data</b>	JSON Object	Dimensions of the metric (if any).	{ "read_latency": 0.98, "ops_write": 20, "ops_read": 30, "write_latency": 0.55, }	Has additional info about a metric (called “Dimensions” in Splunk)  Has different key-vals depending on a given metric  Like for CPU: it can have key-vals to like “kernel”, “user”  For disk: can have latency/ throughput, operation name

## Summary of all the current metrics

Metric name	Metric value	Metric dimensions ( <b>data.xxx</b> below)
<b><i>system.cpu.util.pct</i></b>	cpu utilization percentage aggregated <b>across all cpus</b>	user, kernel, idle
<b><i>system.disk.ops.count</i></b>	disk read/write operations aggregated <b>across all disk instances</b>	count, op (read/write), latency, avgLatency, throughput
<b><i>system.net.total.bytes</i></b>	network utilization - total bytes (in + out) of a given network interface	networkInterface, inBytes, outBytes, inPackets, outPackets
<b><i>system.nfs.ops.count</i></b>	nfs read/write operations aggregated <b>across all instances</b>	count, op (read/write), latency, avgLatency, throughput
<b><i>system.iscsi.ops.count</i></b>	iscsi read/write operations aggregated <b>across all instances</b>	count, op (read/write), latency, avgLatency, throughput
<b><i>system.tcp.total.bytes</i></b>	tcp connection statistics aggregated by service (nfs/iscsi/dsp etc)	congestionWindowSize, inBytes, inUnorderedBytes, localAddress, outBytes, receiveWindowSize, remoteAddress, retransmittedBytes, roundTripTime, sendWindowSize, service  unacknowledgedBytes, unsendBytes
<b><i>system.dataset.total.bytes</i></b>	dataset performance - total number of bytes read + written per dataset (dsources/vdb etc)	dataset, nread, nwritten, type (virtual, dsources, staging)
<b><i>system.capacity.source.size</i></b>	overall system capacity - actual used space in bytes	actualSpace, totalSpace, activeSpace, actualSpace, descendantSpace, logSpace, manualSpace, policySpace, syncSpace, timeflowUnvirtualizedSpace, unownedSnapshotSpace, unvirtualizedSpace

<b>Metric name</b>	<b>Metric value</b>	<b>Metric dimensions (data.xxx below)</b>
<b><i>system.capacity.consumer.size</i></b>	consumer capacity - actual used space in bytes per consumer (vdb/pdb etc)	syncSpace, descendantSpace, activeSpace, timeflowUnvirtualizedSpace, objectType, dSource, actualSpace, groupName, manualSpace, unownedSnapshotSpace, unvirtualizedSpace, logSpace, policySpace, consumerName

## Fluentd plugin service for API modules

### Overview

The Delphix Fluentd plugin service assisted in a feature that provided options for configuring a Delphix engine that forwards events and metrics to a Splunk host. Delphix has developed methods to extend this capability for use with other monitoring packages (ELK Stack, Datadog, etc.). Fluentd plugins provide a mechanism to customize the Delphix engine's forwarding capabilities for output to other data consumers.

The Fluentd plugin is a tar file with a configuration template, including any gem files that are required to execute the directives in the configuration file. Once the plugin is uploaded, the configuration occurs by collecting user input for the variables required by the template. The interfaces will have changed since the set of variables needed is now mutable from plugin to plugin. Splunk configuration will be available out of the box with no additional plugins. This feature uses one UI for all Fluentd configurations.

 The current implementation is limited to one data consumer at a time. Only one plugin, in addition to the default SplunkHec plugin, can be uploaded. This is an intended simplification for the initial Fluentd release version.

## Technical details

### Architectural diagram

High Level Overview

### GUI, API or CLI changes (if any)

APIs with a corresponding CLI for uploading plugins and Fluentd configuration have been added. The service/insight/plugins API displays the plugins that are available.

```

service insight plugins> ls

Objects  REFERENCE          PLUGIN          GEMS  ATTRIBUTEDEFINITIONS
SCHEMADEFINITION

FLUENTD_PLUGIN-1      splunkHec      ...            ...
...

Operations

requestUploadToken
    
```

The splunkHec plugin appears by default and cannot be deleted. Additionally, the requestUploadToken operation provides a token needed to upload a plugin via the data/upload API. If a second plugin is uploaded, it will appear in the list. Before a third plugin could be uploaded, the second must be selected and deleted.

The following curl commands illustrate the use of the API to upload a plugin:

```
curl -s -X POST -k --data @- http://<engine-name>/resources/json/delphix/session -c ~/cookies.txt -H "Content-Type: application/json" <<EOF
```

```
{
  "type": "APISession",
  "version": {
    "type": "APIVersion",
    "major": 1,
    "minor": 4,
    "micro": 3
  }
}
```

```
}
```

```
EOF
```

```
curl -s -X POST -k --data @- http://<engine-name>/resources/json/delphix/login -b ~/cookies.txt -c ~/cookies2.txt -H "Content-Type: application/json" <<EOF
```

```
{
  "type": "LoginRequest",
  "username": "sysadmin",
  "password": "sysadmin",
  "target": "SYSTEM"
}
```

```
EOF
```

```
curl -s -X POST -k --data @- http://<engine-name>/resources/json/delphix/service/insight/plugins/requestUploadToken -b ~/cookies2.txt -H "Content-Type: application/json" <<EOF
```

```
Returns the token e.g: {"type":"OKResult","status":"OK","result":{"type":"FileUploadResult","url":"/resources/json/delphix/data/upload","token":"59346df5-3ecd-4ced-afbf-97acefa156dc"},"job":null,"action":null}
```

```
curl -b ~/cookies2.txt -X POST -F "file=@/Users/blewis/ws/far-dev/splunk_host_port.far" -F "token=<token>" http://<engine-name>/resources/json/delphix/data/upload
```

The service/insight/plugins API displays the tokens that are available.

An example for creating a configuration with the default splunkHec plugin:

```
service insight configuration> create

service insight configuration create *> set plugin=splunkHec; set enabled=true; edit
attributes

service insight configuration create attributes *> add; set name=hec_host; set
value=http://vmname-splunkhost.delphix.com; back

service insight configuration create attributes *> add; set name=hec_port; set
value=8088; back;

service insight configuration create attributes *> add; set
type=FluentdSecretAttribute;

service insight configuration create attributes 2 *> set name=hec_token; set
secretValue=bb75c032-bdea-4c19-b152-d158cf13e019; back

service insight configuration create attributes *> add; set name=eventsIndex; set
value=delphix_events; back;

service insight configuration create attributes *> add; set name=protocol; set
value=https; back

service insight configuration create attributes *> add; set
name=metricsPushFrequency; set value=60; back

service insight configuration create attributes *> add; set name=metricsIndex; set
value=delphix_metrics; back

service insight configuration create attributes *> add; set name=eventsPushFrequency;
set value=60; back;

service insight configuration create attributes *> ls

**Creating default splunkHec configuration from GUI**

1. Login as a sysadmin user and select **Fluentd Configuration** under the Preferences menu.

2. The splunkHec plugin appears in the dropdown by default.

## Fluentd Configuration ✕

Select a plugin Configuration

splunkHec + 🗑️

protocol

hec\_port

metricsPushFrequency

metricsIndex

eventsIndex

eventsPushFrequency

hec\_host

hec\_token

Close Save

3. Additional plugins can be added by using the + button on the right.

4. The new plugin uploaded can be viewed in the dropdown menu and selected to add a configuration.

5. The delete button on the right can be used to delete a selected plugin.
6. The name of fields for configuration would be the same as those provided in the uploaded plugin file.

## Fluentd Configuration ✕

Select a plugin Configuration + 🗑️

Save

7. The configuration can be saved by clicking the save button on the bottom.
8. When loading an existing configuration on UI, the secret fields are masked.

### Implementation

Secret attributes have been introduced in order to protect private data such as passwords and tokens. In the CLI and API, they are identified by the **FluentdSecretAttribute** type. In plugins, attribute names in the config file template beginning with **\_secret** indicate secret data.

### Known issues

Fluentd runs in a systemd container to limit negative side-effects from a bad plugin. More security can be added to this container by running as a non-root user, in addition to limiting the size of the log and buffer files it can write.

## Performance analytics management

Delphix offers various performance analytics tools to help users monitor throughput, latency, and other key metrics. Learn more about how to leverage these tools and how to architect your Delphix deployment for optimal performance.

This section covers the following topics:

- [Performance analytics](#)
- [Storage performance configuration options](#)
- [Architecture for performance - hypervisors and host](#)
- [Target host OS and database configuration options](#)

## Performance analytics

This section covers the following topics:

- [Performance analytics tool overview](#)
- [Working with performance analytics graphs in the graphical user interface](#)
- [Performance analytics statistics reference](#)
- [Performance analytics tool API reference](#)
- [Performance analytics case study: using a single statistic](#)
- [Performance analytics case study: using multiple statistics](#)

## Performance analytics tool overview

This topic describes the Performance Analytics tool and illustrates some basic uses of it.

### Introduction

The performance analytics tool allows introspection into how the Delphix Engine is performing. The introspection techniques it provides are tuned to allow an iterative investigation process, helping to narrow down the cause associated with the performance being measured. Performance analytics information can be accessed through the Delphix Management application, as described in [Working with Performance Analytics Graphs in the Graphical User Interface](#), as well as the CLI and the web services API, as described in other topics in this section. The default statistics that are being collected on the Delphix Engine include CPU utilization, network utilization, and disk, NFS, and iSCSI IO operations (see [Performance Analytics Statistics Reference](#) for details).

The performance tool operates with two central concepts: **statistics** and **statistic slices**.

### Statistics

Each statistic describes some data that can be collected from the Delphix Engine. The first piece of information a statistic provides is its **type**, which you will use as a handle when creating a statistic slice. It also gives the **minimum collection interval**, which puts an upper bound on the frequency of data collection. The actual data a statistic can collect is described through a set of **axes**, each of which describes one "dimension" of that statistic. For example, the statistic associated with Network File System (NFS) operations has a **latency axis**, as well as an **operation type axis** (among many others), which allows users to see NFS latencies split by whether they were reads or writes.

Each axis has some important information embedded in it.

- The **name** of the axis provides a short description of what the axis collects and is used when creating a statistic slice
- A **value** type, which tells you what kind of data will be collected for this axis. The different value types are **integer**, **boolean**, **string**, and **histogram**. The first three are straightforward, but statistic axes with a histogram type can collect a distribution of all the values encountered during each collection interval. This means that instead of seeing an average NFS operation latency every collection interval, you can see a full distribution of operation latencies during that interval. This allows you to see outliers as well as the average, and observe the effects of caching on the performance of your system more easily.
- A **constraint** type, which is only relevant while creating a statistic slice, and will be described in more detail below

One last bit of information that an axis provides makes the most sense after seeing how data points are queried. In the most basic situation, you would only collect one axis of a statistic, such as the latency axis from the NFS operations statistic. When you ask for data, you would get back a data point for every collection interval in the time range you requested. These data points would be grouped into a single stream.

However, if you had collected the operation type axis as well as the latency axis, you would get two streams of datapoints: one for reading operations, and one for write operations.

Because the operation axis applies to many data points, the data points returned are split into two streams, and the operation axis is stored with the top-level stream instead of with each data point in the streams. However, the latency axis will be different for each data point in a stream, so it is not an attribute of the stream, but instead an attribute of the datapoint.

### Statistic slices

Statistics describe what data can be collected and are auto-populated by the system, but statistic slices are responsible for actually collecting the data, and you must create them manually when you want to collect some performance data. Each slice is an instantiation of exactly one statistic, and can only gather data that is described by that statistic. "Slices" are so named because each one provides a subset of the information available from the parent statistic it is associated with. A statistic can be thought of as describing the axes of a multidimensional

space, whereas you typically will only want to collect a simpler slice of that space due to the large number of axes available.

When you specify a slice, there are several fields that you must supply:

- The statistic type this slice is associated with. This must be the same type as the statistic of which this is an instantiation.
- The collection interval, which must be greater than the minimum collection interval the parent statistic gives
- The axes of the parent statistic this slice will collect

Finally, a slice can place constraints on axes of its parent statistic, allowing you to limit the data you get back. For instance, if you're trying to narrow down the cause of some high NFS latency outliers, it may be useful to filter out any NFS latencies which are shorter than one second. To do this, you would place a constraint on the latency axis of an NFS operation slice that states that the values must be higher than one second. You can constrain any axis in the same fashion, and each axis' description in the parent statistic gives a constraint type that can be applied to it. This allows you to place different types of constraints on the latency axis (which is a number measured in nanoseconds) than the operation type axis (which is an enum that can take the values "read" or "write").

#### Persisting analytics data

Data collected by slices is persisted temporarily on the Delphix Engine. Performance data is guaranteed to be available at the finest resolution for six hours, then is compressed to per-minute data and held for seven days, and finally compressed to per-hour data and held for 30 days. If data of a certain resolution will be needed longer than these limits, you should instruct the slice to remember the data permanently until you are done using it. The commands to manage this are listed in the [Performance Analytics Tool API Reference](#).

## Working with performance analytics graphs in the graphical user interface

This topic describes the performance analytics graphs that are available in the Delphix Management application, and the controls for changing the views of those graphs.

### Accessing the performance analytics graphs

1. Log into the Delphix Management application.
2. In the **Resources** menu, select **Performance Analytics**.
3. Use the controls described below to view statistics and their related graphs.

### General graph display and controls

Control Name	Control description	Usage
<b>Chart Tabs</b>	Specifies which graphs/charts are displayed.	Chart tabs have a multiple select drop-down which has the same three options checked by default (CPU, Network, Disk IO). Users can show/hide graphs by checking/unchecking drop-down options.
<b>Timescale</b>	Controls the time range of data displayed in the graph. Available values are 1 minute, 1 hour, and 1 day. By default, 1 minute is selected.	Timescale options are presented as a drop-down, select from <b>Minute</b> , <b>Hour</b> , or <b>Day</b> to change the Zoom Level.
<b>Pause/Resume</b>	Pause/Resume icons	All charts display live data so users can pause it by clicking the Pause button in the upper right corner of each graph. Once the chart is paused, the Pause button is replaced by the Resume button so a user can click it to see live data again.
<b>Op. Type</b>	Operation Type (used in Disk IO, NFS and iSCSI charts)	Options are presented as a drop-down.
<b>Shown Data Timeline</b>	Displays timestamps of data points in the graph.	
<b>Available Data Timeline</b>	Displays navigable time ranges for historical data.	

Control Name	Control description	Usage
<b>Timeline Selector</b>	Specifies the start and end time for the currently displayed data. The range displayed is controlled by the <b>Zoom Level</b> .	<p>Drag the <b>Timeline Selector</b> to view statistics for a specific time in the past, or click the scroll bar arrows to view the desired time period. You can also use the slider controls within the Timeline Selector to change the length of time for which data is displayed.</p> <p>When the Timeline Selector is aligned to the right of the timeline, it represents live data that is updated every second. If the Timeline Selector is moved from the right alignment with the timeline, the data displayed is historical and no live updates are displayed. To resume live data updates, move the Timeline Selector back to the right-aligned position representing the current time. The data will be refreshed to the latest data, and live updates will resume every second.</p>
<b>Graph Legend</b>	<p>If more than one set of information is presented on the graph, the Graph Legend displays a description and color for each set and allows a user to toggle that set-off and on.</p> <p>For example, in the network graph there can be multiple network interfaces, and for each network interface the graph displays four statistics (bytes sent, bytes received, packets sent, packets received). When a user toggles off a specific network interface, all four statistics corresponding to that interface are hidden from the screen.</p> <p>The color for lines representing bytes sent and packets sent is the same. Similarly, the color for lines representing bytes received and packets received is the same. This makes it easier to correlate the number of bytes and the number of packets sent/received for a given network interface.</p>	To hide a set of information, click on the set name within the Graph Legend. Data representing that set is removed from the graph, and the set's name is greyed out. To show a set that has been hidden, click on the set name.

Latency, timeline page, and tooltip graph display and controls

Control Name	Control Description	Usage
<p><b>Timeline Page Left/Right Button</b></p>	<p>Scrolls Available Data Timeline by a specified time range depending on the current <b>Zoom Level</b>.</p>	<p>When the <b>Zoom Level</b> is set to <b>Minute</b>, click <b>Timeline Page Left</b>. The <b>Available Data Timeline</b> is changed to show the time period for the previous hour prior.</p>
<p><b>Graph Value Tooltip</b></p>	<p>Shows a value, along with the time stamp, for a specific data point.</p>	<p>Mouse over a data point on the graph to view the tooltip.</p>
<p><b>Latency Range Selector</b> (shown on latency heatmaps only)</p>	<p>Controls the lower and upper limits for displayed latency buckets.</p>	<p>Drag the lower and upper controls to drill down into a specific range of latency buckets. Latency buckets that fall outside of the selected range are summarized, the lower row representing latency buckets that are below the lower limit, and the upper row representing latency buckets that are below the upper limit of the latency range selector. Use Latency Range Selector to view a more detailed distribution of latencies for a specific range.</p>
<p><b>Latency Outlier Selector</b> (shown on latency heatmaps only)</p>	<p>Hides infrequent latencies (outliers) based on a percentage threshold. Its range is 0%-10%, with a default of 0%. The percentage establishes a threshold below which buckets are considered "outliers" and are hidden from the graph. Each bucket is assigned a percentage based on the ratio of its count vs the maximum count of any bucket in the graph.</p>	<p>Drag the control to the desired percentage threshold.</p>

## Performance analytics statistics reference

This topic describes the various performance statistics that are available for the Delphix Engine and how they can be used to analyze and improve performance.

The Delphix Engine is shipped with a default set of statistics that are collected on Delphix Engine virtual appliance, as listed below. The statistics are stored for up to 30 days for historical analysis.

<b>Statistic</b>	<b>Description</b>
<b>CPU Utilization</b>	Total CPU utilization for all CPUs. This statistic includes both kernel and user time.
<b>Network Throughput</b>	Measures throughput in bytes and packets, broken down by sent vs. received data and by the network interface. Each network interface shows four graphed lines: bytes sent, bytes received, packets sent, and packets received. To help easily correlate bytes and packets, the same color is used for both bytes and packet values.
<b>Disk IO</b>	Measures a number of IO operations, and the latencies and throughput of the underlying storage layer. The statistic is represented by the graphs - a column chart for IO operations, a heat map for latency distribution, and a line chart for throughput. IO operations are grouped by reads and write. A shaded rectangle on a latency heat map represents an IO operation (read or write) which falls within a particular time range (bucket). The shading of rectangles depends on the number of IO operations that fall within a particular bucket - the higher the count the darker the shading.
<b>NFS</b>	Measures a number of IO operations and the latencies and throughput of the NFS server layer in the Delphix Engine. Its graphical representation is similar to the Disk IO graph. It is useful to diagnose the performance of dSources and VDBs that use NFS mounts (Oracle, PostgreSQL).
<b>iSCSI</b>	Measures the number of IO operations, and the latencies and throughput, of the iSCSI server layer in the Delphix Engine. Its graphical representation is similar to the Disk IO graph. It is useful to diagnose the performance of Microsoft SQL Server dSources and VDBs.

## Performance analytics tool API reference

This topic describes basic commands and command syntax for using the Performance Analytics tool.

### Statistic types

More detailed information can be found about each statistic type through the command-line interface (CLI) and webservice API, but the following table provides more information about how similar I/O stack statistic types relate to each other.

Statistic type	Description	Axis name	Axis description	Axis value type
NFS_OPS	Provides information about Network File System operations. This is the entry point to the Delphix Engine for all Oracle database file accesses.	op	I/O operation type	STRING
		path	Path of the affected file	STRING
		size	I/O sizes in bytes	HISTOGRAM
		avgLatency	Average I/O latency in nanoseconds	INTEGER
		cached	Whether reads were cached	BOOLEAN
		latency	I/O latencies in nanoseconds	HISTOGRAM
		count	Number of I/O operations	INTEGER
		client	Address of the client	STRING
		throughput	I/O throughput in bytes	INTEGER
		sync	Whether writes were synchronous	BOOLEAN

Statistic type	Description	Axis name	Axis description	Axis value type
iSCSI_OPS	Provides information about iSCSI operations. This is the entry point to the Delphix Engine for all SQL Server file accesses.	Same axes as NFS_OPS, except for path, cached, and sync.		
VFS_OPS	This layer sits immediately below NFS_OPS and iSCSI_OPS. It should give almost exactly the same latencies, assuming no unexpected behavior is occurring.	Same axes as NFS_OPS, except for client.		
DxFS_OPS	This layer sits immediately below VFS_OPS, and the two of them should give almost exactly the same latencies.	Same axes as VFS_OPS.		
DxFS_IO_QUEUE_OPS	This layer sits below DxFS_OPS, but the latencies will differ from that layer because this layer batches together operations to increase throughput.	op	I/O operation type	STRING
		count	Number of I/O operations	INTEGER
		size	I/O sizes in bytes	HISTOGRAM
		avgLatency	Average I/O latency in nanoseconds	INTEGER
		latency	I/O latencies in nanoseconds	HISTOGRAM
		throughput	I/O throughput in bytes	INTEGER
		priority	Priority of the I/O	STRING

Statistic type	Description	Axis name	Axis description	Axis value type
DISK_OPS	This layer sits below DxFs_IO_QUEUE_OPS at the bottom of the I/O stack and measures interactions between the Delphix Engine and disks.	op	I/O operation type	STRING
		count	Number of I/O operations	INTEGER
		size	I/O sizes in bytes	HISTOGRAM
		avgLatency	Average I/O latency in nanoseconds	INTEGER
		latency	I/O latencies in nanoseconds	HISTOGRAM
		throughput	I/O throughput in bytes	INTEGER
		error	Whether the I/O resulted in an error	BOOLEAN
		device	Device the I/O was issued to	STRING
CPU_UTIL	This is unrelated to the layers of the I/O stack. It measures CPU utilization on the Delphix Engine.	idle	Idle time in milliseconds (showAxes command may incorrectly state nanoseconds)	INTEGER
		user	User time in milliseconds (showAxes command may incorrectly state nanoseconds)	INTEGER
		kernel	Kernel time in milliseconds (showAxes command may incorrectly state nanoseconds)	INTEGER

Statistic type	Description	Axis name	Axis description	Axis value type
		dtrace	DTrace time in milliseconds (showAxes command may incorrectly state nanoseconds) Subset of time in kernel	INTEGER
		cpu	Which CPU was utilized	INTEGER
NETWORK_INTERF ACE_UTIL	Network interface utilization on the Delphix Engine.	inBytes	Number of bytes received	INTEGER
		inPackets	Number of packets received	INTEGER
		outBytes	Number of bytes transmitted	INTEGER
		outPackets	Number of packets transmitted	INTEGER
		networkInterface	Which network interface was utilized	STRING
TCP_STATS	Statistics for all established TCP connections on the Delphix Engine.	localAddress	Local address for the TCP connection	STRING
		localPort	Local port for the TCP connection	INTEGER
		remoteAddress	Remote address for the TCP connection	STRING
		remotePort	Remote port for the TCP connection	INTEGER
		inBytes	Data bytes received	INTEGER

Statistic type	Description	Axis name	Axis description	Axis value type
		outBytes	Data bytes transmitted	INTEGER
		receiveWindowSize	The size of the local receive window	INTEGER
		sendWindowSize	The size of the peer's receive window	INTEGER
		congestionWindow Size	The size of the local congestion window	INTEGER
		retransmittedBytes	Bytes retransmitted	INTEGER
		inUnorderedBytes	Number of bytes received out of order. This is a subset of the "inBytes" value	INTEGER
		unacknowledgedBytes	Number of bytes sent but unacknowledged	INTEGER
		roundTripTime	Smoothed average round-trip time in microseconds	INTEGER

#### Statistic axis value types

Values are returned when a slice's data is queried. Each axis has a value type, which specifies how the data will be returned.

Value type	Description
INTEGER	The value is returned as an integer. For information about what units the integer is measured in, read the documentation for the related datapoint or datapoint stream type.
BOOLEAN	The value is returned as a boolean.

Value type	Description
STRING	The value is returned as a string. This is used for enum values as well, although the set of strings that can be returned is limited.
HISTOGRAM	<p>The value is returned as a log-scale histogram. The histogram has size buckets whose minimum and maximum value get doubled. Histograms are returned as JSON maps, where the keys are the minimum value in a bucket and the values are the height of each bucket.</p> <p>Here is an example histogram. Notice that buckets with a height of zero are not included in the JSON object and that keys and values are represented as strings.</p> <pre>{   "32768": "10",   "65536": "102",   "262144": "15",   "524288": "2" }</pre>

Axis constraints are used to limit the data which a slice can collect. Each axis specifies a constraint type which can be used to limit that axis' values.

Constraint type	Description
<code>BooleanConstraint</code>	A superclass in which constraints on boolean values must extend. Currently, the only subclass is <code>BooleanEqualConstraint</code> , which requires that a boolean axis equal either true or false (depending on user input).
<code>EnumConstraint</code>	A superclass in which constraints on enum values must extend. Currently, the only subclass is <code>EnumEqualConstraint</code> , which requires that an enum axis be equal to a user-specified value.
<code>IntegerConstraint</code>	A superclass in which constraints on integer values must extend. Subclasses include <code>IntegerLessThanConstraint</code> , <code>IntegerGreaterThanConstraint</code> , and <code>IntegerEqualConstraint</code> , which map to the obvious comparators for integers.
<code>NullConstraint</code>	This class signifies that an axis cannot be constrained. This makes the most sense for axes that provide an average value - placing a constraint on an average doesn't make sense because you are not able to include or discard a particular operation based on what its effects would be on the average of all operations.

Constraint type	Description
<code>PathConstraint</code>	A superclass in which constraints on file path values must extend. Currently, the only subclass is <code>PathDescendantConstraint</code> , which requires that a path value must be a descendant of the specified path (it must be contained within it). This only applies to paths on the Delphix Engine itself, and all paths used must be canonical Unix paths starting from the root of the filesystem.
<code>StringConstraint</code>	A superclass in which constraints on string values must extend. Currently, the only subclass is <code>StringEqualsConstraint</code> , which requires that a string value must equal a user-specified string.

## Statistic slice commands

Command	Description and Usage Examples
<code>getData</code>	This is used to fetch data from a statistic slice which has been collecting data for a while. It returns a datapoint set, which is composed of datapoint streams, which contain datapoints. For a full description, see the <a href="#">Performance Analytics Tool Overview</a> .
<code>rememberRange</code>	This is used to ensure that data collected during an ongoing investigation doesn't get deleted unexpectedly. If this is not used, data is only guaranteed to be persisted for 24 hours. If it is used, data will be remembered until a corresponding call to <code>stopRememberingRange</code> is made.
<code>stopRememberingRange</code>	This is used to allow previously-remembered data to be forgotten. The data will be forgotten on the same schedule as brand new data, so you will have at least 24 hours before data which you have stopped remembering is deleted. This undoes the <code>rememberRange</code> operation.
<code>pause</code>	This command pauses the collection of a statistic slice, causing no data to be collected until <code>resume</code> is called.
<code>resume</code>	This command resumes the collection of a statistic slice, undoing a <code>pause</code> operation.

## Performance analytics case study: using a single statistic

### Overview

The Delphix Engine uses the Network File System (NFS) as the transport for Oracle installations. An increase in the NFS latency could be causing sluggishness in your applications running on top of Virtual Databases. This case study illustrates how this pathology can be root caused using the analytics infrastructure. This performance investigation uses one statistic to debug the issue, and utilizes the many axes of that statistic to filter down the probable cause of the issue. This technique uses an approach of iteratively drilling down by inspecting new axes of a single statistic and filtering the data to only include information about the operations that appear slow. This technique is valuable for determining which use patterns of a resource might be causing the system to be sluggish. If you isolate a performance issue using this approach but aren't sure what is causing it or how to fix it, Delphix Support can provide assistance for your investigation.

The following example inspects the statistic which provides information about NFS I/O operations on the Delphix Engine. This statistic can be collected a maximum of once every second, and the axes it can collect, among others, are:

- **latency**, a histogram of wait times between NFS requests and NFS responses
- **size**, a histogram of the NFS I/O sizes requested
- **op**, whether the NFS requests were reads or writes
- **client**, the network address of the NFS client which was making requests

 Roughly the same performance information can be obtained from the iSCSI interface as well.

### Investigation

Because the NFS layer sits above the disk layer, all NFS operations that use the disk synchronously (synchronous writes and uncached reads) will have latencies that are slightly higher than those of their corresponding disk operations. Usually, because disks have very high seek times compared to the time the NFS server spends on CPU, disk operations are responsible for almost all of the latency of these NFS operations. In the graphical representation, you can see this by looking at how the slower cluster of NFS latencies (around 2ms-8ms) have similar latencies to the median of the disk I/O (around 2ms-4ms). Another discrepancy between the two plots is that the number of disk operations is much lower than the corresponding number of NFS operations. This is because the Delphix filesystem batches together write operations to improve performance.

If database performance is not satisfactory and almost all of the NFS operation time is spent waiting for the disks, it suggests that the disk is the slowest piece of the I/O stack. In this case, disk resources (the number of IOPS to the disks, the free space on the disks, and the disk throughput) should be investigated more thoroughly to determine if adding more capacity or a faster disk would improve performance. However, care must be taken when arriving at these conclusions, as a shortage of memory or a recently-rebooted machine can also cause the disk to be used more heavily due to fewer cache hits.

Sometimes, disk operations will not make up all of the latency, which suggests that something between the NFS server and the disk (namely, something in the Delphix Engine) is taking a long time to complete its work. If this is the case, it is valuable to check whether the Delphix Engine is resource-constrained, and the most common areas of constraint internal to the Delphix Engine are CPU and memory. If either of those is too limited, you should investigate whether expanding the resource would improve performance. If no resources appear to be constrained or more investigation is necessary to convince you that adding resources would help the issue, Delphix Support is available to help debug these issues.

While using this technique, you should take care to recognize the limitations that caching places on how performance data can be interpreted. In this example, the Delphix Engine uses a caching layer for the data it stores, so asynchronous NFS writes will not go to disk quickly because they are being queued into larger batches, and

cached NFS reads won't use the disk at all. This causes these types of NFS operations to return much more quickly than any disk operations are able to, resulting in a very large number of low-latency NFS operations in the graph above. For this reason, caching typically creates a bimodal distribution in the NFS latency histograms, where the first cluster of latencies is associated with operations that only hit the cache, and the second cluster of latencies is associated with fully or partially uncached operations. In this case, cached NFS operations should not be compared to the disk latencies because they are unrelated. It is possible to use techniques described in the first example to filter out some of the unrelated operations to allow a more accurate mapping between disk and NFS latencies.

1. Begin the performance investigation by examining some high-level statistics such as **latency**.
  - a. Create a slice with statistic type **NFS\_OPS**.
  - b. Set the slice to collect the **latency** axis.
  - c. Do not add any constraints.
  - d. Set the collection interval. Anything over one second will work, but ten seconds gives good data resolution and will not use a lot of storage to persist the data that is collected. The rest of this example will assume a collection period of ten seconds for all other slices, but any value could be used.

```
/analytics

create
set name=step1
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=latency
commit
```

This will collect a time-series of histograms describing NFS latencies as measured from inside the Delphix Engine, where each histogram shows how many NFS I/O operations fell into each latency bucket during every ten-second interval. After a short period of time, read the data from the statistic slice:

```
select step1
getData
setopt format=json
commit
setopt format=text
```

The `setopt` steps are optional but allow you to see the output better via the CLI. The output looks like this:

```
{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "NfsOpsDatapointStream",
    "datapoints": [{
      "type": "IoOpsDatapoint",
      "latency": {
        "32768": "16",
        "65536": "10"
      }
    }
  ]
}
```

```

    },
    "timestamp": "2013-05-14T15:51:40.000Z"
  }, ...]
}],
"resolution": 10
}

```

The data is returned as a set of datapoint streams. Streams hold the fields which are shared by all the datapoints they contain. Later on, in this example, the **op** and **client** fields will be added to the streams, and multiple streams will be returned. Streams are described in more detail in [Performance Analytics Tool Overview](#). The `resolution` field indicates the number of seconds that corresponds to each datapoint, which in our case matches the requested `collectionInterval`. The `collectionEvents` field is not used in this example, but lists when the slice was paused and resumed, to distinguish between moments when no data was collected because the slice was paused, and moments when there was no data to collect.

2. If the latency distributions show some slow NFS operations, the next step would be to determine whether the slow operations are reads or writes.
  - a. Specify a new **NFS\_OPS** slice to collect this by collecting the **op** and **latency** axes.
  - b. To limit output to the long-running operations, create a constraint on the **latency** axis that prohibits the collection of data on operations with latency less than 100ms.

```

/analytics

create
set name=step2
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=op,latency

edit axisConstraints.0
set axisName=latency
set type=IntegerGreaterThanConstraint
set greaterThan=100000000
back

commit

```

The `greaterThan` field is 100ms converted into nanoseconds.

Reading the data proceeds in the same way as the first step, but there will be two streams of datapoints, one where `op=write`, and one where `op=read`.

**info** : Because we constrained output to operations with latencies higher than 100ms, none of the latency histograms will all have any buckets for latencies lower than 100ms.

3. After inspecting the two data streams, you might find that almost all slow operations are writes, so it could be valuable to determine which clients are requesting the slow writes, and how large each of the writes is.
  - a. To collect this data, create a new **NFS\_OPS** slice which collects the **size** and **client** axes.
  - b. Add constraints ensuring that the **op** axis should be constrained to only collect data for **write** operations, and the **latency** axis should be constrained to filter operations taking less than 100ms.
 

**info** : Because the constraint on the `op` axis dictates that it will always have the value `write`, it is not necessary to collect the `op` axis anymore.

```
/analytics

create
set name=step3
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=size,client

edit axisConstraints.0
set type=IntegerGreaterThanConstraint
set axisName=latency
set greaterThan=100000000
back

edit EnumEqualConstraint
set type=StringEqualConstraint
set axisName=op
set equals=write
back

commit
```

Reading the data proceeds in the same way as the first two steps, but there will be one stream for every NFS client. The dataset collected by this will consist of a set of streams, one corresponding to each NFS client, and each stream will be a time-series of histograms showing write sizes that occurred during each ten-second interval.

Continuing to use this approach will allow you to narrow down the slow writes to a particular NFS client, and you may be able to tune that client in some way to speed it up.

## Performance analytics case study: using multiple statistics

### Overview

This case study illustrates an investigation involving more than one metric. In typical performance investigations, you will need to peel out multiple layers of the stack in order to observe the component causing the actual performance pathology. This case study specifically examines sluggish application performance caused due to slow IO responses from the disk subsystem. This example will demonstrate a technique of looking at the performance of each layer in the I/O stack to find which layer is responsible for the most latency, then looking for constrained resources that the layer might need to access. This technique is valuable for finding the most-constrained resource in the system, potentially giving actionable information about resources that can be expanded to increase performance.

For the following example, we will inspect latency at two layers: the Network File System (NFS) layer on the Delphix Engine, and the disk layer below it. Both of these layers provide the **latency** axis, which gives a histogram of wait times for the clients of each layer.

### Investigation

The analytics infrastructure enables users to observe the latency of multiple layers of the software stack. This investigation will examine the latency of both layers, and then draw conclusions about the differences between the two.

### Setup

To measure this data, create two slices. When attempting to correlate data between two different statistics, it can be easier to determine causation when collecting data at a relatively high frequency. The fastest that each of these statistics will collect data is once per second, so that is the value used.

1. A slice collecting the **latency** axis for the statistic type **NFS\_OPS**.

```
/analytics
create
set name=slice1
set statisticType=NFS_OPS
set collectionInterval=1
set collectionAxes=latency
commit
```

2. A slice collecting the **latency** axis for the statistic type **DISK\_OPS**.

```
/analytics
create
set name=slice2
set statisticType=DISK_OPS
set collectionInterval=1
set collectionAxes=latency
commit
```

After a short period of time, read the data from the first statistic slice.

```
select slice2
getData
setopt format=json
commit
setopt format=text
```

The same process works for the second slice. The `setopt` steps allow you to see the output better via the CLI. The output for the first slice might look like this:

```
{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "NfsOpsDatapointStream",
    "datapoints": [{
      "type": "IoOpsDatapoint",
      "latency": {
        "512": "100",
        "1024": "308",
        "2048": "901",
        "4096": "10159",
        "8192": "2720",
        "16384": "642",
        "32768": "270",
        "65536": "50",
        "131072": "11",
        "524288": "64",
        "1048576": "102",
        "2097152": "197",
        "4194304": "415",
        "8388608": "320",
        "16777216": "50",
        "33554432": "20",
        "67108864": "9",
        "268435456": "2"
      },
      "timestamp": "2013-05-14T15:51:40.000Z"
    }, {
      "type": "IoOpsDatapoint",
      "latency": {
        "512": "55",
        "1024": "130",
        "2048": "720",
        "4096": "6500",
        "8192": "1598",
        "16384": "331",
        "32768": "327",
        "65536": "40",
        "131072": "14",
        "262144": "87",
        "524288": "42",
```

```

        "1048576": "97",
        "2097152": "662",
        "4194304": "345",
        "8388608": "280",
        "16777216": "22",
        "33554432": "15",
        "134217728": "1"
    },
    "timestamp": "2013-05-14T15:51:41.000Z"
  }, ...]
}],
"resolution": 1
}

```

For the second slice, it might look like this:

```

{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "DiskOpsDatapointStream",
    "datapoints": [{
      "type": "IoOpsDatapoint",
      "latency": {
        "262144": "1",
        "524288": "11",
        "1048576": "13",
        "2097152": "34",
        "4194304": "7",
        "8388608": "2",
        "16777216": "3",
        "33554432": "1"
      }
    },
    "timestamp": "2013-05-14T15:51:40.000Z"
  }, {
    "type": "IoOpsDatapoint",
    "latency": {
      "262144": "5",
      "524288": "10",
      "1048576": "14",
      "2097152": "26",
      "4194304": "7",
      "8388608": "4",
      "16777216": "2"
    }
  },
  "timestamp": "2013-05-14T15:51:41.000Z"
  }, ...]
}],
"resolution": 1
}

```

The data is returned as a set of datapoint streams. Streams hold the fields that would otherwise be shared by all the datapoints they contain, but only one is used in this example because there are no such fields. Streams are discussed in more detail in the [Performance Analytics Tool Overview](#). The `resolution` field indicates how many seconds each datapoint corresponds to, which in our case matches the requested `collectionInterval`. The `collectionEvents` field is not used in this example, but lists when the slice was paused and resumed to distinguish between moments when no data was collected because the slice was paused, and moments when there was no data to collect.

Graphically, these four histograms across two seconds look like this:

## Analysis

Because the NFS layer sits above the disk layer, all NFS operations that use the disk synchronously (synchronous writes and uncached reads) will have latencies that are slightly higher than those of their corresponding disk operations. Usually, because disks have very high seek times compared to the time the NFS server spends on CPU, disk operations are responsible for almost all of the latency of these NFS operations. In the graphical representation, you can see this by looking at how the slower cluster of NFS latencies (around 2ms-8ms) have similar latencies to the median of the disk I/O (around 2ms-4ms). Another discrepancy between the two plots is that the number of disk operations is much lower than the corresponding number of NFS operations. This is because the Delphix filesystem batches together write operations to improve performance.

If database performance is not satisfactory and almost all of the NFS operation time is spent waiting for the disks, it suggests that the disk is the slowest piece of the I/O stack. In this case, disk resources (the number of IOPS to the disks, the free space on the disks, and the disk throughput) should be investigated more thoroughly to determine if adding more capacity or a faster disk would improve performance. However, care must be taken when arriving at these conclusions, as a shortage of memory or a recently-rebooted machine can also cause the disk to be used more heavily due to fewer cache hits.

Sometimes, disk operations will not make up all of the latency, which suggests that something between the NFS server and the disk (namely, something in the Delphix Engine) is taking a long time to complete its work. If this is the case, it is valuable to check whether the Delphix Engine is resource-constrained, and the most common areas of constraint internal to the Delphix Engine are CPU and memory. If either of those is too limited, you should investigate whether expanding the resource would improve performance. If no resources appear to be constrained or more investigation is necessary to convince you that adding resources would help the issue, Delphix Support is available to help debug these issues.

While using this technique, you should take care to recognize the limitations that caching places on how performance data can be interpreted. In this example, the Delphix Engine uses a caching layer for the data it stores, so asynchronous NFS writes will not go to disk quickly because they are being queued into larger batches, and cached NFS reads won't use the disk at all. This causes these types of NFS operations to return much more quickly than any disk operations are able to, resulting in a very large number of low-latency NFS operations in the graph above. For this reason, caching typically creates a bimodal distribution in the NFS latency histograms, where the first cluster of latencies is associated with operations that only hit the cache, and the second cluster of latencies is associated with fully or partially uncached operations. In this case, cached NFS operations should not be compared to the disk latencies because they are unrelated. It is possible to use techniques described in the first example to filter out some of the unrelated operations to allow a more accurate mapping between disk and NFS latencies.

1. Begin the performance investigation by examining some high-level statistics such as **latency**.
  - a. Create a slice with statistic type **NFS\_OPS**.
  - b. Set the slice to collect the **latency** axis.
  - c. Do not add any constraints.
  - d. Set the collection interval. Anything over one second will work, but ten seconds gives good data resolution and will not use a lot of storage to persist the data that is collected. The rest of this example will assume a collection period of ten seconds for all other slices, but any value could be used.

```
/analytics  
  
create  
set name=step1  
set statisticType=NFS_OPS  
set collectionInterval=10  
set collectionAxes=latency  
commit
```

This will collect a time series of histograms describing NFS latencies as measured from inside the Delphix Engine, where each histogram shows how many NFS I/O operations fell into each latency bucket during every ten-second interval. After a short period of time, read the data from the statistic slice:

```
select step1
getData
setopt format=json
commit
setopt format=text
```

The `setopt` steps are optional but allow you to see the output better via the CLI. The output looks like this:

```
{
  "type": "DatapointSet",
  "collectionEvents": [],
  "datapointStreams": [{
    "type": "NfsOpsDatapointStream",
    "datapoints": [{
      "type": "IoOpsDatapoint",
      "latency": {
        "32768": "16",
        "65536": "10"
      },
      "timestamp": "2013-05-14T15:51:40.000Z"
    }, ...]
  }],
  "resolution": 10
}
```

The data is returned as a set of datapoint streams. Streams hold the fields which are shared by all the data points they contain. Later on, in this example, the **opt** and **client** fields will be added to the streams, and multiple streams will be returned. Streams are described in more detail in [Performance Analytics Tool Overview](#). The `resolution` field indicates the number of seconds that corresponds to each datapoint, which in our case matches the requested `collectionInterval`. The `collectionEvents` field is not used in this example, but lists when the slice was paused and resumed, to distinguish between moments when no data was collected because the slice was paused, and moments when there was no data to collect.

2. If the latency distributions show some slow NFS operations, the next step would be to determine whether the slow operations are reads or write.
  - a. Specify a new **NFS\_OPS** slice to collect this by collecting the **op** and **latency** axes.
  - b. To limit output to the long-running operations, create a constraint on the **latency** axis that prohibits the collection of data on operations with latency less than 100ms.

```
/analytics
create
```

```

set name=step2
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=op,latency

edit axisConstraints.0
set axisName=latency
set type=IntegerGreaterThanConstraint
set greaterThan=100000000
back

commit

```

The `greaterThan` the field is 100ms converted into nanoseconds.

Reading the data proceeds in the same way as the first step, but there will be two streams of data points, one where `op=write`, and one where `op=read`.

**Info** : Because we constrained output to operations with latencies higher than 100ms, none of the latency histograms will all have any buckets for latencies lower than 100ms.

3. After inspecting the two data streams, you might find that almost all slow operations are writes, so it could be valuable to determine which clients are requesting the slow writes, and how large each of the writes is.
  - a. To collect this data, create a new **NFS\_OPS** slice which collects the **size** and **client** axes.
  - b. Add constraints ensuring that the **op** axis should be constrained to only collect data for **write** operations, and the **latency** axis should be constrained to filter operations taking less than 100ms.

**Info**: Because the constraint on the `op` axis dictates that it will always have the value `write`, it is not necessary to collect the `op` axis anymore.

```

/analytics

create
set name=step3
set statisticType=NFS_OPS
set collectionInterval=10
set collectionAxes=size,client

edit axisConstraints.0
set type=IntegerGreaterThanConstraint
set axisName=latency
set greaterThan=100000000
back

edit EnumEqualConstraint
set type=StringEqualConstraint
set axisName=op
set equals=write
back

commit

```

Reading the data proceeds in the same way as the first two steps, but there will be one stream for every NFS client. The dataset collected by this will consist of a set of streams, one corresponding to each NFS client, and each stream will be a time series of histograms showing write sizes that occurred during each ten-second interval.

Continuing to use this approach will allow you to narrow down the slow writes to a particular NFS client, and you may be able to tune that client in some way to speed it up.

## Storage performance configuration options

This section covers the following topics:

- [Optimal storage configuration parameters for the Delphix engine](#)
- [Storage performance test tool \(fio\)](#)
- [Storage performance expectations and troubleshooting](#)
- [Storage performance test tool notes - restricted](#)

## Optimal storage configuration parameters for the Delphix engine

This topic describes minimum capacity and throughput requirements for storage devices used with the Delphix Engine.

Storage for the Delphix Engine must be able to sustain the aggregated Input/Output Operations Per Second (IOPS) and throughput (MBPS) requirements of all its Virtual Databases. Throughput required for data source synchronization (SnapSync and LogSync) must also be supported.

The Delphix Engine requires storage for:

Item	Description
A copy of each Source Database	The copies are compressed.
Unique Block Changes in VDBs	When changes are made to a VDB, the Delphix Engine stores the changes in new blocks associated with only that VDB. The new blocks are compressed.
Timeflow for dSources and VDBs	The TimeFlow kept for each dSource and VDB comprises snapshots of the database (blocks changed since the previous snapshot) and archive logs. The retention period for this history of changes is determined by policies established for each dSource and VDB. The TimeFlow is compressed.

In addition to the storage for these items, the Delphix Engine requires 30% free space in its storage for the best performance. See [An Overview of Capacity and Performance Information](#) and related topics for more details on managing capacity for the Delphix Engine.

Best practices for storage performance include:

- Initial storage is equal to the size of the physical source databases. For high redo rates and/or high DB change rates, allocate an additional 10-20% storage.
- Add storage when storage capacity approaches 30% free
- Use physical LUNS allocated from storage pools or RAID groups that are configured for availability
- Never share physical LUNS between the Delphix Engine and other storage clients.
- Keep all physical LUNS the same size.
- Provision storage using VMDKs or RDMs operating in virtual compatibility mode.
- VMDKs should be **Thick Provisioned, Lazy Zeroed**. The underlying physical LUNS can be thin provisioned.
- Physical LUNS used for RDMs should be thick provisioned.
- Measure or estimate the required IOPS and manage the storage disks to provide this capacity. It is common to use larger numbers of spindles to provide the IOPS required.
- Physical LUNS carved from RAID 1+0 groups or pools with dedicated spindles provide higher IOPS performance than other configurations
- Maximize Delphix Engine vRAM for a larger system cache to service reads

### Example

There are two production dSources, totaling 5 TB in size. 5 VDBs will be created for each. The Sum of read and write rates on the production source database is moderate (1000 IOPS), the sum of VDB read rate is moderate (950 IOPS), and the VDB update rate is low (50 IOPS).

- Initial storage equal to 5TB, provisioned as 5 x 1 TB physical LUNS, Thin Provisioned. Allow for expansion of the LUNS to 2TB.

- Provision as 5 x 950 GB Virtual Disks. VMDKs must be Thick Provisioned, Lazy Zeroed. Using 1 TB LUNs allows expansion to 2 TB (ESX 5.1 limit).
- The storage provisioned to the Delphix Engine storage must be able to sustain 1000 IOPs (950 + 50). For this reason, each physical LUN provisioned to the Delphix Engine must be capable of sustaining 200 IOPs. IOPs on the source databases are not relevant to the Delphix Engine.
- 64GB Delphix Engine vRAM for a large system cache

## Storage performance test tool (fio)

### Overview

This fio-based Storage Performance Tool executes a synthetic workload to evaluate the performance characteristics of the storage assigned to the Delphix Engine. The Storage Performance Tool is a feature that is only available from the command-line

### Prerequisites

Prior to setting up the Delphix Engine, the admin can login to the Delphix CLI using a **sysadmin** account to launch the Storage Performance Tool. Because the test is destructive, it will only run against storage which has not been allocated to Delphix for use by the engine.

### Running the storage test via CLI

1. Login as the sysadmin user to the Delphix Engine CLI.
  - a. If the Delphix Engine has not been setup yet, the **network setup** prompt appears. Discard the command.

```
delphix network setup update *> discard delphix>
```

2. Create a storage test.

```
delphix> storage test
delphix storage test> create
delphix storage test create *>
```

3. Use 'get' to see other optional arguments. Modify the test parameters as needed and **commit** to start the test.

```
delphix storage test create *> get
type: StorageTestParameters
devices: (unset)
duration: 120
initializeDevices: true
initializeEntireDevice: false
testRegion: 128GB
tests: ALL
delphix storage test create *> commit
STORAGE_TEST-1
Dispatched job JOB-1
STORAGE_TEST_EXECUTE job started for "SYSTEM".
Initializing storage test.
Starting storage device initialization.
ETA: 1:28:44.
Storage device initialization complete.
Starting storage benchmarking.
Starting random read workload with 4 KB block size and 8 jobs.
Starting random read workload with 4 KB block size and 16 jobs.
```

```

Starting random read workload with 4 KB block size and 32 jobs.
Starting random read workload with 4 KB block size and 64 jobs.
Starting random read workload with 8 KB block size and 8 jobs.
Starting random read workload with 8 KB block size and 16 jobs.
Starting random read workload with 8 KB block size and 32 jobs.
Starting random read workload with 8 KB block size and 64 jobs.
Starting sequential write workload with 1 KB block size and 4 jobs.
Starting sequential write workload with 4 KB block size and 4 jobs.
Starting sequential write workload with 8 KB block size and 4 jobs.
Starting sequential write workload with 16 KB block size and 4 jobs.
Starting sequential write workload with 32 KB block size and 4 jobs.
Starting sequential write workload with 64 KB block size and 4 jobs.
Starting sequential write workload with 128 KB block size and 4 jobs.
Starting sequential write workload with 1024 KB block size and 4 jobs.
Starting sequential write workload with 1 KB block size and 16 jobs.
Starting sequential write workload with 4 KB block size and 16 jobs.
Starting sequential write workload with 8 KB block size and 16 jobs.
Starting sequential write workload with 16 KB block size and 16 jobs.
Starting sequential write workload with 32 KB block size and 16 jobs.
Starting sequential write workload with 64 KB block size and 16 jobs.
Starting sequential write workload with 128 KB block size and 16 jobs.

Starting sequential read workload with 1024 KB block size and 64 jobs.
Storage benchmarking complete.
Generating results.
Storage test completed successfully.
STORAGE_TEST_EXECUTE job for "SYSTEM" completed successfully.
delphix storage test>

```

4. The job will be submitted and visible in the Delphix Management application.
5. Retrieve the test results

```

delphix storage test> select STORAGE_TEST-1
delphix storage test 'STORAGE_TEST-1'> result
delphix storage test 'STORAGE_TEST-1' result *> commit
Test Results
-----
Test ID:          1

```

Test System UUID: 564dc710-7bb1-c064-12c2-2659032acf1b  
 Start Time: 03-Feb-2015 10:52:31 -0800  
 End Time: 03-Feb-2015 12:20:25 -0800

Test Grades:

Test Name	Latency			Load Scaling	
	Average	95th %ile	Grade	Scaling	Grade
Random 8K Reads w/ 16 jobs	2.16	4.77	A-	0.89	poor
Random 4K Reads w/ 16 jobs	1.62	3.73	A	0.54	fair
Sequential 1M Reads w/ 4 jobs	62.60	182.00	D	1.40	bad
Sequential 1K Writes w/ 4 jobs	1.30	2.61	C	0.07	good
Sequential 128K Writes w/ 4 jobs	10.19	26.00	D	1.35	bad

Grading Key:

Test Name	Grade:	A+	A	A-	B	B-	C	C-	D
Small Random Reads		2.0	4.0	6.0	8.0	10.0	12.0	14.0	> 14.0
Large Seq Reads		12.0	14.0	16.0	18.0	20.0	22.0	24.0	> 24.0
Small Seq Writes		0.5	1.0	1.5	2.0	2.5	3.0	3.5	> 3.5
Large Seq Writes		2.0	4.0	6.0	8.0	10.0	12.0	14.0	> 14.0

delphix storage test 'STORAGE_TEST-1'>

```

## Storage performance expectations and troubleshooting

### Overview

When you initially set up a Delphix Engine, there is a one-time opportunity (and requirement) to run your storage performance tests on unconfigured storage. Because of the test method we use, we cannot run it again in the same way after the engine is set up. When run from a Windows target host, [DiskSpd](#) can help establish a performance baseline that combines the network and storage performance over **iSCSI**. This can be a significant help in determining whether your current or future performance is within normal expectations. Similarly, you can use [fio](#) on the \*nix side from a target system to establish a performance baseline that combines the network and storage performance over **NFS**.

### Troubleshooting and information gathering questions

These questions are presented roughly in order of priority. The answers to these questions should help narrow down possible causes of poor performance.

- All storage traffic for virtualization Target hosts goes over the network. Have you reviewed [Network Performance Expectations and Troubleshooting?](#)
- Were all of the [storage best practices](#) been applied?
  - In particular, check the IO Operation limit and round-robin settings.
- Was a baseline ever created for this host using DiskSpd or fio? (How does our current performance compare?)
- Gather storage specs from VM/storage administrator:
  - Vendor, Model (EMC VMAX 40k, HP 3PAR StoreServ 7000)
  - IO latency SLO (e.g. 5ms 99.999%)
  - IOPS/GB SLO (e.g. 0.68 IOPS/GB for EMC Gold-1)
    - <https://store.emc.com/us/Product-Family/EMC-VMAX-Products/EMC-VMAX-Cloud-Edition/p/EMC-VMAXCloud>
  - Cache type and size (e.g. FAST cache 768GB)
  - Tier, #Pools; if auto – tiering; relocation schedule (e.g. Gold/Silver/Auto/3 pools/etc)
  - Pool detail: (#) drives, RPM, Type (e.g. Pool1: (20) EFD, (30) 15k SAS, Pool 2: (40) 10k SATA)
  - Connection (XXGb Fibre Channel)
  - Dedicated or Shared pool (how many applications/servers)

### Conclusion

If you need further help, please contact Delphix Support or Professional Services to assist in getting the best performance possible from your environment.

## Storage performance test tool notes - Restricted

In addition to displaying the storage results on screen via CLI or retrieving results from a locally downloaded support bundle, Delphix employees have additional options to retrieve the information via ssh or via a support bundle uploaded to <http://upload.delphix.com>.

### Download via SSH

Note the destination folder increments based on the job number. storage-test/1, storage-test/2, storage-test/3. etc.

```
delphix$ ls -l /var/delphix/server/storage-test/1/fio_summary*
-rw-r---- 1 delphix staff 2310 Apr 29 17:51 /var/delphix/server/storage-test/1/
fio_summary_full.out
-rw-r---- 1 delphix staff 1318 Apr 29 17:51 /var/delphix/server/storage-test/1/
fio_summary_grades.out
-rw-r---- 1 delphix staff 793 Apr 29 17:51 /var/delphix/server/storage-test/1/
fio_summary.out
```

Versions older than 4.2 default to /opt/delphix/monitor/htdocs

### Upload to portal; download from portal

1. Upload to portal:
  - a. Login to the Delphix Management application.
  - b. Select System -> Support Logs
  - c. Choose to transfer the logs to Delphix
2. Download steps:
  - a. Go to <http://upload.delphix.com>, login and select "browse uploaded files" to find the file

### Extraction

1. Extract the file to locate "storage\_tests.tar" in the root of the compressed file.

## Architecture for performance - hypervisors and host

The Delphix Engine is a "virtual appliance": a virtual machine guest running within a hypervisor on a physical host. There are a few key best practices we need to keep in mind as we consider this architecture.

### Architecture best practices hypervisor host ESX

#### Hypervisor

1. ESXi 6.x or 7.0 is recommended. ESXi 5.5 or earlier is no longer supported.
2. HyperThreading (HT) for Intel®-based servers (no HT on AMD CPUs).
  - a. Disable HT in BIOS, on the ESXi Host, **and** disable [HT Sharing](#) on the Delphix VM for consistency. This is our best practice, disable at all levels.  
Any other combination may result in a non-deterministic performance.
  - b. When HT cannot be turned off for both the Host and Delphix VM, it should be turned on at all levels, not run in a "mixed-mode".
    - i. HT disablement at a guest level only can result in non-deterministic performance.
    - ii. A dedicated ESXi host, cluster, or DRA is recommended where consistent VDB performance is paramount.
  - c. VM migration to a new host (e.g. VMware HA or vMotion) can create mismatched HT settings.
3. ESXi overhead (resources required for hypervisor cannot be reserved, they must be left unallocated).
  - a. Memory Overhead - 10% of available RAM must not be allocated to guest VMs.
    - i. *Example: 256GB RAM, allocate 230GB to Delphix VM, leave 26GB for ESX*
  - b. CPU Overhead - At least 2 cores (ideally 4) must not be allocated to guest VMs.
    - i. *Example: If 16 physical cores are available, allocate 12 to the virtual machines, leaving 4 for the hypervisor*
    - ii. Why 4? Certain hypervisor functions require precedence over any virtualized system. If a hypervisor needs more CPU than the amount currently available, it can de-schedule all other virtual processes to ensure adequate CPU resources for the hypervisor. Ensuring the hypervisor will not have to de-schedule any running virtual processes (worlds) by setting aside and not over-subscribing CPUs for virtual functions will leave them available for hypervisor use.
    - c. Even if the Delphix VM is the only VM on a host, the hypervisor is still active and essential; and still needs resources.
4. BIOS Power Management should be set to High Performance where ESXi controls power management.
  - a. It can be impacted by [VMware KB 1018206](#) - poor VM application performance caused by power management settings.
  - b. Ensure that all BIOS-managed C-States other than C0 are disabled if power management is hardware controlled.
  - c. Ensure that all ACPI sleep states above S0 are disabled in the BIOS.
  - d. Examples of popular server lines from Cisco, HP, Dell are below. *Specific models will vary, use the appropriate spec sheet.*
    - i. **UCS:** disable the Processor Power States, disable Power Technology, set Energy Performance to "Performance"
    - ii. **HP ProLiant:** set HP Power Regulator to HP "Static High Performance" mode
    - iii. **Dell:** set BIOS System Profile to "Performance Optimized" mode
5. VMware HA can be enabled; VMware DRS is generally disabled.
6. Blade/Rack Server Firmware and ESXi Drivers should be updated to the latest versions.
7. For Intel®-based servers with E5-2600 v2 processors.
8. Two typical server configurations:
  - a. Blade Farm

- b. Rack Server  
Hyper-Converged configurations are possible for high performance.

#### Virtual machine guest

1. For VM machine settings, see [Virtual Machine Requirements for VMware Platform](#).
2. VMWare Guest Specifications:
  - a. Minimum: 8 vCPU x 64 GB  
Small: 8 vCPU x 128GB  
Medium: 16 vCPU x 256 GB  
Large: 24 vCPU x 512 GB
  - b. Reserve 100% of RAM and CPU:
    - i. If the ESX host is dedicated to Delphix, CPU and RAM reservations are advised but not necessary, however, swap space will be required on the hypervisor to compensate for the lack of reserved RAM.
  - c. [Hyperthreading](#) - See the ESX host section at the top. Disable HT Sharing on VM, disable HT on ESX Host.
3. Assign single-core sockets for vCPUs in all cases. If there is a compelling reason to use multi-core vCPUs, reference the following article from VMware which describes matching virtual multi-core sockets to the hardware ESX is running on.  
[VMware Article on CoresPerSocket](#)  
Example: *ESXi Host has 2 socket x 18 core Intel Xeon, Delphix Engine wants 16 vCPU.*  
Configure Delphix VM with 2 Virtual Sockets, 8 Cores Per Socket to utilize hardware architecture.
4. Avoid placing other extremely active VMs on the same ESX host.
5. Monitoring - vSphere Threshold Alerts for CPU, Network, Memory, Capacity.
6. To set the number of vCPUs per virtual machine via the vSphere client, please see "[Virtual CPU Configuration](#)" in the Administration guide:  
[ESXi 6.0](#)
  - a. [Delphix VM CPU Utilization](#) - Delphix KB article on what makes Delphix VMs similar to other resource-intensive applications
  - b. [Exchange on VMware Best Practices](#) - VMworld 2013 session
  - c. [ESXTOP Reference, Blog](#)
7. Ensure that the latest available VMware drivers and firmware versions are installed for HBAs, NICs, and any other hardware components configured on the Delphix virtual machine. This is a critical step that can have a massive impact on the performance and robustness of our solution.

## Target host OS and database configuration options

This topic describes configuration options to maximize the performance of a target host in a Delphix Engine deployment. These network-tuning changes should improve performance for any data source

### OS-specific tuning recommendations

#### Solaris

When exclusively using Oracle's Direct NFS Feature (dNFS), it is unnecessary to tune the native NFS client. However, tuning network parameters is still relevant and may improve performance.

#### Tuning the Kernel NFS client

On systems using Oracle Solaris Zones, the kernel NFS client can only be tuned from the global zone.

On Solaris, by default the maximum I/O size used for NFS read or write requests is 32K. For I/O requests larger than 32K, the I/O is broken down into smaller requests that are serialized. This may result in poor I/O performance. To increase the maximum I/O size:

1. As superuser, add to the `/etc/system` file:

```
* For Delphix: change the maximum NFS block size to 1M
set nfs:nfs3_bsize=0x100000
```

2. Run this command:

```
# echo "nfs3_bsize/W 100000" | mdb -kw
```

It is critical that the above command be executed exactly as shown, with quotations and space. Errors in the command may cause a system panic and reboot.

#### Tuning TCP buffer sizes

On systems using Oracle Solaris Zones, TCP parameters, including buffer sizes, can only be tuned from the global zone or in exclusive-IP non-global zones. Shared-IP non-global zones always inherit TCP parameters from the global zone.

#### Solaris 10

It is necessary to install a new Service Management Facility (SMF) service that will tune TCP parameters after every boot. These are samples of the files needed to create the service:

File	Installation location
<code>dlpx-tcptune</code>	<code>/lib/svc/method/dlpx-tcptune</code>
<code>dlpx-tune.xml</code>	<code>/var/svc/manifest/site/dlpx-tune.xml</code>

1. As superuser, download the files and install them in the path listed in the **Installation location** in the table.
2. Run the commands:

```
# chmod 755 /lib/svc/method/dlpx-tcptune
# /usr/sbin/svccfg validate /var/svc/manifest/site/dlpx-tune.xml
# /usr/sbin/svccfg import /var/svc/manifest/site/dlpx-tune.xml
# /usr/sbin/svcadm enable site/tcptune
```

Verify that the SMF service ran after being enabled by running the command:

```
# cat `svccprop -p restarter/logfile tcptune`
```

You should see output similar to this:

```
[ May 14 20:02:02 Executing start method ("/lib/svc/method/dlpx-tcptune
start"). ]
Tuning TCP Network Parameters
tcp_max_buf adjusted from 1048576 to 16777216
tcp_cwnd_max adjusted from 1048576 to 4194304
tcp_xmit_hiwat adjusted from 49152 to 4194304
tcp_recv_hiwat adjusted from 128000 to 16777216
[ May 14 20:02:02 Method "start" exited with status 0. ]
```

Solaris 11

### As superuser

Run the following commands:

```
# ipadm set-prop -p max_buf=16777216 tcp
# ipadm set-prop -p _cwnd_max=4194304 tcp
# ipadm set-prop -p send_buf=4194304 tcp
# ipadm set-prop -p recv_buf=16777216 tcp
```

Linux/Redhat/CentOs

### Tuning the Kernel NFS client

In Linux, the number of simultaneous NFS requests is limited by the Remote Procedure Call (RPC) subsystem. The maximum number of simultaneous requests defaults to 16. Maximize the number of simultaneous requests by changing the kernel tunable `sunrpc.tcp_slot_table_entries` value to 128.

To ensure that the interface does not drop packets because the driver is configured with one receive queue, use the following commands to view the adaptor policy/increase Rx queue length.

```
<LinuxHost> $ ifconfig -a
```

```
eth0      Link encap:Ethernet  HWaddr 00:22:BB:CC:DD:22
          inet addr:www.xxx.yyy.zzz  Bcast:www.xxx.yyy.zzz  Mask:255.255.255.0
          inet6 addr: feee::222:bbff:fffc:ddd/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:9000  Metric:1
          RX packets:760729910 errors:0 dropped:700 overruns:0 frame:0
          TX packets:309094054 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:1023150307866 (952.8 GiB)  TX bytes:190673864056 (177.5 GiB)
```

#### RHEL4 through RHEL5.6

1. As superuser, run the following command to change the instantaneous value of simultaneous RPC commands:

```
# sysctl -w sunrpc.tcp_slot_table_entries=128
```

2. Edit the file `/etc/modprobe.d/modprobe.conf.dist` and change the line:

```
install sunrpc /sbin/modprobe --first-time --ignore-install sunrpc &&
{ /bin/mount -t rpc_pipefs sunrpc / var /lib/nfs/rpc_pipefs > /dev/ null
  2>&1 || ;;
```

to

```
install sunrpc /sbin/modprobe --first-time --ignore-install sunrpc &&
{ /bin/mount -t rpc_pipefs sunrpc / var /lib/nfs/rpc_pipefs > /dev/ null
  2>&1 ; /sbin/sysctl -w sunrpc.tcp_slot_table_entries=128; }
```

Improper changes to the `modprobe.conf.dist` file may disrupt the use of NFS on the system. Check with your system administrator or operating system vendor for assistance. Save a copy of the `modprobe.conf.dist` in a directory other than `/etc/modprobe.d` before starting.

#### RHEL 5.7 through RHEL 6.2

1. As superuser, run the following command to change the instantaneous value of simultaneous RPC commands:

```
# sysctl -w sunrpc.tcp_slot_table_entries=128
```

2. If it doesn't already exist, create the file `/etc/modprobe.d/rpcinfo` with the following contents:

```
options sunrpc tcp_slot_table_entries=128
```

#### RHEL 6.3 onwards

Beginning with RHEL 6.3, the number of RPC slots is dynamically managed by the system and does not need to be tuned. Although the `sunrpc.tcp_slot_table_entries` tuneable still exists, it has a default value of 2, instead of 16 as in prior releases. The maximum number of simultaneous requests is determined by the new tuneable, `sunrpc.tcp_max_slot_table_entries` which has a default value of 65535.

## Tuning TCP buffer sizes

Packages should install their configuration files in `/usr/lib/` (distribution packages) or `/usr/local/lib/` (local installs). Files in `/etc/` are reserved for the local administrator, who may use this logic to override the configuration files installed by vendor packages. It is recommended to prefix all filenames with a two-digit number and a dash, to simplify the ordering of the files. The following is an example approach and should be tested beforehand.

```

echo "Target Kernel Parameter Tunings. This is optional but highly recommended."
echo
echo "Tuning TCP Buffer Sizes - Parameters should be as below"
echo
echo "This script takes the recommended vendor approach of creating a file in /usr/
lib/sysctl.d and running \"sysctl -p\""
echo "This script will comment out identical settings in /etc/sysctl.conf, which
would otherwise override the Delphix settings"
echo "Admins can at their discretion set larger values, either in sysctl.conf or /
usr/lib/sysctl.d/60-sysctl.conf"
echo "----"
echo "net.ipv4.tcp_timestamps = 1"
echo "net.ipv4.tcp_sack = 1"
echo "net.ipv4.tcp_window_scaling = 1"
echo "net.ipv4.tcp_rmem = 4096 16777216 16777216"
echo "net.ipv4.tcp_wmem = 4096 4194304 16777216"
cat /dev/null > /usr/lib/sysctl.d/60-sysctl.conf
#Set NOW
NOW=$(date +%m%d%Y%H%m%s")
echo "net.ipv4.tcp_timestamps = 1" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_sack = 1" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_window_scaling = 1" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_rmem = 4096 16777216 16777216" >> /usr/lib/sysctl.d/60-sysctl.conf
echo "net.ipv4.tcp_wmem = 4096 4194304 16777216" >> /usr/lib/sysctl.d/60-sysctl.conf
echo
echo "Running /sbin/sysctl -p /usr/lib/sysctl.d/60-sysctl.conf"
/sbin/sysctl -p /usr/lib/sysctl.d/60-sysctl.conf
if [ $? -ne 0 ]; then
    echo "Command \"sysctl -p /usr/lib/sysctl.d/60-sysctl.conf\" failed; aborting..."
    exit 1
fi
# Make a backup and Comment out similar lines in /etc/sysctl.conf if they exist
# sed will search for lines which are NOT comments ( ^[^\#]* means starts with
anything other than a "#" ) but contain the parameters either with "." or "/"
notation, and add a Comment.
cp /etc/sysctl.conf /tmp/sysctl.conf.$NOW
sed -i "/^[^\#]*net[\.]ip4[\.]tcp_timestamps/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
sed -i "/^[^\#]*net[\.]ip4[\.]tcp_sack/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
sed -i "/^[^\#]*net[\.]ip4[\.]tcp_window_scaling/s/^\#Commented out by Delphix /" /
etc/sysctl.conf
sed -i "/^[^\#]*net[\.]ip4[\.]tcp_rmem/s/^\#Commented out by Delphix /" /etc/
sysctl.conf

```

```
sed -i "/^[^#]*net[\.\/]ipv4[\.\/]tcp_wmem/s/^\#Commented out by Delphix /" /etc/
sysctl.conf
echo
echo "Running /sbin/sysctl -p /etc/sysctl.conf"
/sbin/sysctl -p /etc/sysctl.conf
if [ $? -ne 0 ]; then
    echo "Command \"sysctl -p /etc/sysctl.conf\" failed; aborting..."
    echo "We put a copy of the original at /tmp/sysctl.conf.$NOW"
    exit 1
fi
```

## NFSv4 only - enabling recover lost locks

RHEL 6.6 onwards

By default, the Redhat NFSv4 client does not attempt to reclaim locks that were lost due to a lease expiration event. This can cause an application to encounter unexpected EIO errors on system calls such as write. The Delphix use case requires that the NFSv4 client attempt to reclaim lost locks that were due to lease expiration. An NFS client module parameter, ' `recover_lost_locks` ', is used to change the default behavior. Use the following command to check if the "recover\_lost\_locks" option is set to 1:

```
grep recover_lost_locks /etc/modprobe.d/*.conf
```

If the option is currently set to 0, change it to 1. If it is missing, proceed to the next paragraph where instruction is provided on how to add the option.

As superuser, run the following two commands to enable the NFS client to recover the lost locks feature:

```
# cat > /etc/modprobe.d/nfs4-locks.conf <<EOF
options nfs recover_lost_locks=1
EOF

# [ -d "/sys/module/nfs" ] && echo Y > /sys/module/nfs/parameters/recover_lost_locks
```

## IBM AIX®

### AIX NFSv4 configuration requirements (7.1 and 7.2)

1. An NFS Domain must be configured.
2. The nfsrgyd service must be running.
3. The NFS server IP address from the Delphix Engine must be mappable to an FQDN.

Configure the nfsv4 domain on the AIX target host

```
bash-3.2# chnfsdom test.com
```

Start the nfsrgyd service and confirm it is active

```
bash-3.2# startsrc -s nfsrgyd

bash-3.2# lssrc -s nfsrgyd
```

Subsystem	Group	PID	Status
nfsrgyd	nfs	7536760	active

Confirm that IP address can be resolved

```
bash-3.2$ host 172.16.105.81
81.105.16.172.in-addr.arpa is dc011.delphix.com
```

Reference: [IBM AIX: HOW TO SETUP NFSV4 MOUNT IN CLIENT AND SERVER](#)

### Tuning the Kernel NFS Client

On AIX, by default the maximum I/O size used for NFS read or write requests is 64K. When Oracle does I/O larger than 64K, the I/O is broken down into smaller requests that are serialized. This may result in poor I/O performance. IBM can provide an Authorized Program Analysis Report (APAR) that allows the I/O size to be configured to a larger value.

1. Determine the appropriate APAR for the version of AIX you are using:

AIX Version	APAR Name
6.1	<a href="#">IV24594</a>
7.1	<a href="#">IV24688</a>

2. Check if the required APAR is already installed by running this command: If the APAR is installed, you will see a message similar to this:

```
# /usr/sbin/instfix -ik IV24594
```

3. If the APAR is not yet installed, you will see a message similar to this:

```
All filesets for IV24594 were found.
```

```
There was no data for IV24594 in the fix database.
```

4. Download and install the APAR, as necessary. To find the APARs, use the main search function at <http://www.ibm.com/us/en/>, specifying the name of the APAR you are looking for from step 1. A system reboot is necessary after installing the APAR.
5. Configure the maximum read and write sizes using the commands below:

```
# nfsd -p -o nfs_max_read_size=524288
# nfsd -p -o nfs_max_write_size=524288
```

6. Confirm the correct settings using the command:

You should see an output similar to this:

```
# nfsd -L nfs_max_read_size -L nfs_max_write_size
```

```

NAME CUR DEF BOOT MIN MAX UNIT TYPE
DEPENDENCIES
-----
---
nfs_max_read_size 512K 64K 512K 512 512K Bytes D
-----
---
nfs_max_write_size 512K 64K 512K 512 512K Bytes D
-----
---

```

### Tuning delayed TCP acknowledgements

By default, AIX implements a 200ms delay for TCP acknowledgments. However, it has been found that disabling this behavior can provide significant performance improvements.

To disable delayed ACKs on AIX the following command can be used:

```
# /usr/sbin/no -o tcp_nodelayack=1
```

To make the change permanent use:

```
# /usr/sbin/no -p -o tcp_nodelayack=1
```

## HP-UX

### Tuning the Kernel NFS client

On HP-UX, by default the maximum I/O size used for NFS read or write requests is 32K. For I/O requests larger than 32K, the I/O is broken down into smaller requests that are serialized. This may result in poor I/O performance.

1. As superuser, run the following command:

```
# /usr/sbin/kctune nfs3_bsize=1048576
```

2. Confirm the changes have occurred and are persistent by running the following command and checking the output:

```
# grep nfs3 /stand/system
tunable nfs3_bsize 1048576
```

### Tuning TCP buffer sizes

1. As superuser, edit the `/etc/rc.config.d/nddconf` file, adding or replacing the following entries:

```

TRANSPORT_NAME[0]=tcp
NDD_NAME[0]=tcp_recv_hiwater_def
NDD_VALUE[0]=16777216
#
TRANSPORT_NAME[1]=tcp
NDD_NAME[1]=tcp_xmit_hiwater_def
NDD_VALUE[1]=4194304

```

In this example, the array indices are shown as `0` and `1`. In the actual configuration file, each index used must be strictly increasing, with no missing entries. See the comments at the beginning of `/etc/rc.config.d/nddconf` for more information.

1. Run the command:

```
/usr/bin/ndd -c
```

2. Confirm the settings:

```

# ndd -get /dev/tcp tcp_recv_hiwater_def
16777216
# ndd -get /dev/tcp tcp_xmit_hiwater_def
4194304

```

## OS-specific tuning recommendations for windows

### iSCSI tuning

These are our recommendations for the Windows iSCSI initiator configuration. Please note that the parameters below will affect **all** applications running on the Windows target host, so you should make sure that the following recommendations do not contradict best practices for other applications running on the host.

For details about the Windows iSCSI configuration, see [Requirements for Windows iSCSI Configuration](#)

For targets running Windows Server, the iSCSI initiator driver timers can be found at:

```
HKLM\SYSTEM\CurrentControlSet\Control\Class\{4D36E97B-E325-11CE-
```

```
BFC1-08002BE10318}\<> . Please see How to Modify the Windows Registry on the Microsoft Support site for details about configuring registry settings.
```

Registry Value	Type	Default	Recommended	Comments
MaxTransferLength	REG_DWORD	262144	131072	This controls the maximum data size of an I/O request. A value of 128K is optimal for the Delphix Engine as it reduces the segmentation of the packets as they go through the stack.
MaxBurstLength	REG_DWORD	262144	131072	This is the negotiated maximum burst length. 128K is the optimal size for the Delphix Engine.
MaxPendingRequests	REG_DWORD	255	512	This setting controls the maximum number of outstanding requests allowed by the initiator. At most this many requests will be sent to the target before receiving a response for any of the requests.
MaxRecvDataSegmentLength	REG_DWORD	65536	131072	This is the negotiated MaxRecvDataSegmentLength.

#### Receive side scaling

Follow the instructions here to enable RSS: [Enable Receive Side Scaling \(RSS\) on Staging/Target Network Interfaces](#) hosted on the target, such as Oracle, SQL Server, Sybase, or vFiles. They should be applied to all Delphix targets.

## Usage data management

The Delphix User-click Analytics feature is a lightweight method to capture how users interact with Delphix product user interfaces. The goal of capturing this data is to get a better understanding of product usage, engagement, and user behavior, and to use this data to improve Delphix products and customer experience. This feature is enabled by default for customers deploying on or upgrading to this version. User-click Analytics may also be disabled via the UI.

### Disabling user-click analytics

 This procedure will disable user-click analytics on both the Delphix Engine and Delphix Self-Service.

Procedure to disable user-click analytics via the GUI

Complete the following steps to disable user-click analytics via the GUI.

1. Login to the Delphix Setup application using the sysadmin **username** and **password**.

2. From the Outbound Connectivity panel, click **Modify**.

3. In the **Outbound Connectivity** window, uncheck **Enable Usage Analytics**.

4. Click **Save**.

## Starting, stopping, and restarting your engine

Several options are available to start, stop, restart, or reset the Delphix engine for maintenance or debugging purposes.

### Factory reset

This option returns the Delphix Engine to the "factory default" state. This removes all the data and configurations except for the network configuration and NTP settings. The network configuration and NTP settings are retained in order to make it is easy for a user to start the Delphix Engine otherwise you will need to perform the initial steps to configure the network via the VMware Hypervisor console.

It is recommended to shut down and remove all VDBs before resetting the Delphix Engine. Failure to do so could lead to stale data mounts in target environments. For the same reason, disable all dSources that use validated sync.

Use Factory Reset only when a complete reset and reconfiguration of the Delphix Engine is necessary, as all Delphix Engine objects will be de-allocated.

Complete the following steps to reset the Delphix Engine via GUI:

1. Connect to the Delphix Setup application and log in as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Factory Reset**.

3. Click **OK**.

### Restart

If the Delphix Java process is in a bad state, you may need to restart it to get it operational again.

You can restart the management process safely without shutting down VDBs or disabling dSources because restarting this process has no impact on running VDBs or dSources.

Complete the following steps to restart the Delphix Management Process via GUI:

1. Login to the Delphix Setup application as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Restart**.
3. Click **OK**.

Complete the following steps to restart the Delphix Management Process via CLI:

1. Log in to the CLI as a system administrator.
2. Go to system > restart
3. delphix system restart \*> commit

## Reboot

If the management stack for your Delphix Engine hangs, you will need to perform a reboot.

Before performing a reboot, all your VDBs must be shut down and dSources disabled to maintain data integrity.

Complete the following steps to reboot the Delphix Engine via GUI:

1. Login to the Delphix Setup application as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Reboot**.
3. Click **OK**.

Complete the following steps to reboot the Delphix Engine via CLI:

1. Log in to the CLI as a system administrator.
2. Go to system > reboot
3. delphix system reboot \*> commit

### Reboot vs restart

The only difference between the Restart and Reboot is that the Restart functions without shutting down the VDBs and disabling the dSources.

## Power off

Occasionally, it is necessary to shut down the Delphix Engine for maintenance purposes. Before performing a shutdown, all your VDBs must be shut down and dSources disabled to maintain data integrity.

Once the Delphix Engine is powered off, you can power it back on through your hypervisor console.

Use the following steps to shut down the Delphix Engine via GUI:

1. Login to the Delphix Setup application as a system administrator.
2. From the **Dashboard** panel, click the Actions menu (...) on the top right and select **Power Off**.
3. Click **OK**.

Use the following steps to shut down the Delphix Engine via CLI:

1. ssh sysadmin@yourengine
2. delphix > system
3. delphix system > shutdown
4. delphix system shutdown \*> commit

## Introduction to privilege elevation profiles

This topic introduces the concept of Privilege Elevation Profiles, how they are managed, and how they are supported. Privilege Elevation Profiles exist to provide the Delphix Engine with a mechanism for running privileged commands in a secure way to achieve the following:

- Mount and Unmount NFS filesystems
- Create and Remove directories in paths not owned by the Delphix OS user
- Examine the running process list
- Run commands as root

Privilege Elevation Profiles is an advanced CLI topic and are not documented as part of the general Delphix Engine User Guide. Changes to the default sudo-based profile scripts, or the creation of new profiles that do not work as expected, can cause serious problems and render the Delphix Engine unusable. This article is aimed at advanced end-users and Delphix Professional Services consultants.

## Support for privilege elevation profiles

 Writing and troubleshooting scripts, such as those required for Privilege Elevation Profiles, is out of scope and not covered by Delphix Support.

Privilege Elevation Profiles need to be tailor-made to work with non-standard environments that may use third-party or proprietary privilege elevation mechanisms other than sudo. Customers are strongly encouraged to work with Delphix Professional Services to formulate reliable profile scripts. There is nothing that prevents customers from creating their own profile scripts. However, customers bear full responsibility for supporting and troubleshooting their own profile scripts. Support for profile scripts created by our Professional Services consultants is still supported by Professional Services.

## How do privilege elevation profiles work?

Privilege Elevation Profiles exist within a two-tier cascading hierarchy. This means there is one default profile for the entire Delphix Engine that should contain scripts for all the operations that require privilege elevation. Additional profiles may contain a subset of the scripts. When a non-default profile is used, the Delphix Engine uses that profile's scripts where they exist and reverts to the scripts in the default profile if no script for the operation exists. By default, the Delphix Engine ships with simple scripts that pass commands to the standard UNIX **sudo** command.

All Environments added to the Delphix Engine get added with the default Privilege Elevation Profile. The profile can be assigned on a per-host basis. Below shows how a host using a non-standard profile will use scripts in the cascading model.

default profile (sudo)	custom profile (myProfile)	host profile	script used
dlpx_mount	my_mount	myProfile	my_mount
dlpx_umount	my_umount		my_umount
dlpx_rmdir			dlpx_rmdir

<b>default profile (sudo)</b>	<b>custom profile (myProfile)</b>	<b>host profile</b>	<b>script used</b>
dlpx_mkdir			dlpx_mkdir
dlpx_ps			dlpx_ps
dlpx_pfexec			dlpx_pfexec

# Upgrade

## **Version compatibility and support pre-checks**

Please refer to [Upgrade matrix](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

## Upgrade

These topics describe processes for upgrading the Delphix Engine.

[Upgrading the Delphix engine: overview](#)

[Upgrade prerequisites](#)

[Downloading the upgrade image](#)

[Uploading the upgrade image](#)

[Applying the upgrade](#)

[Post upgrade](#)

## Upgrading the delphix engine: overview

Upgrading the Delphix Engine is a multi-step process that requires some preparation. The engine upgrade process will affect the availability of the Delphix Engine administrative interface and virtual datasets during the operation based on the type of upgrade chosen. For large configurations and Full/Apply Now upgrades, it can take one to two hours; Delay the Reboot upgrades are typically complete within 15 to 30 minutes. Please refer to [Upgrade Matrix](#) and the **version compatibility and support pre-checks** callout below before proceeding with an upgrade.

The following sections explain the steps involved in the upgrade process with links to detailed instructions for proceeding through each of them.

### Types of upgrade

There are two types of upgrades, which are characterized by the impact they have on VDBs during the operation:

 There is no need to reboot unless instructed to receive a specific fix from Delphix.

Upgrade type	Description
Delay the reboot	The user interface, API, and CLI (Command Line Interface) will only be available to the user performing the upgrade. dSources will stop refreshing from production. Policies execution will be delayed until after the upgrade has been completed. Jobs will be canceled (and resumed after upgrade if supported). Access to VDB data will not be affected by this upgrade and can be used normally.
Apply now	In addition to performing an application upgrade, DelphixOS, the operating system that runs Delphix, will be upgraded and the machine will reboot to the new OS as part of the upgrade process. The Delphix Engine will automatically disable all VDBs and dSources during the upgrade process in order to safely reboot to the new version, and thus you should schedule downtime for your VDB applications.

### Outline of the upgrade process

#### Version compatibility and support pre-checks

Please refer to [Upgrade Matrix](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

The following is an outline of the steps for upgrading the Delphix Engine:

1. **Upload** the upgrade image to the Delphix Engine.
2. **Verify** and **resolve** the system requirements and known defects before starting the upgrade.
3. Schedule the appropriate downtime.
4. **Start** the upgrade and choose the upgrade type.
5. **Address** any runtime failures that happen as part of the upgrade.
6. **Verify** that the upgrade was completed successfully.

## Upgrade prerequisites

### ⚠️ **Version compatibility and support pre-checks**

Please refer to [Upgrade matrix](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

## Scheduling downtime

To determine if an upgrade will require a reboot and VDB downtime refer to [Upgrade matrix](#).

If the OS will not be updated as part of the upgrade, then the upgrade process will have no impact on the availability of VDBs, and you do not need to schedule any downtime for your VDB applications.

If the OS will be updated as part of the upgrade, then you should schedule appropriate downtime for your VDB applications. The Delphix Engine will automatically disable VDBs and dSources during the upgrade. The length of the downtime will be proportional to the number of VDBs.

Long-running jobs including replication and SnapSync will fail during any upgrade.

The upgrade file for the version to which you want to upgrade should be downloaded from the [Delphix download site](#). From 6.0.2.0 onwards, the upgrade images are packaged with the latest version of upgrade pre-checks. Please use the latest upgrade image from the download site since the checks will be updated on a need-by basis.

Delphix Upgrade images are approximately 5GB in size; it is recommended to have both a fast internet connection to the Delphix download site as well as to the Delphix Engine.

The upgrade image should be downloaded or moved to a location accessible to the computer used for navigating the Delphix Management application.

### ⚠️ **Upgrading replication source**

Delphix Engines can only perform replication to engines on the same or higher version. Upgrading a replication source without upgrading its replication targets could cause replication between those peers to fail.

## Verifying the integrity of the downloaded upgrade image

SHA256 checksums can be used to verify the integrity of files downloaded via [download.delphix.com](https://download.delphix.com).

The `sha256sum` checksum listed next to each download will help ensure that a file has not changed as a result of a faulty file transfer, a disk error, or non-malicious meddling.

To calculate the checksum of downloaded files and compare them to the checksum listed on the download portal, the following utilities can be used:

- On Windows, `certutil -HashFile <upgrade.tar.gz> SHA256`
- On macOS or Unix servers with Perl installed, `shasum -a 256 <upgrade.tar.gz>`
- On Unix servers with `coreutils` installed, `sha256sum <upgrade.tar.gz>`.

## Verifying connectivity to datasets and environments

For Upgrades from versions > 5.3.6.0 and <6.0.0.0, your Delphix Engine will automatically quiesce all VDBs and dSources during the upgrade process in order to safely reboot to the new version.

For Upgrades from versions  $\geq$  6.0.0.0, based on the [Upgrade matrix](#) you can choose to postpone the VDB downtime and update just the running stack and related packages by choosing "Delay the Restart" option. You can update the OS at a later date by completing the upgrade.

At the end of the upgrade process, the Delphix Engine will also update the Delphix platform toolkit on each connected environment.

To perform these tasks, the Delphix Engine must be able to connect to the environments in which datasets exist and must have credentials to connect to datasets or applications. Environments involved must be properly configured to enable script execution.

When an environment, dataset, or application is unreachable or misconfigured, the upgrade may encounter access errors, and may not be able to re-start it after the upgrade has been applied.

If you know that a dataset is unavailable for some reason (e.g. host not reachable on the network, or the hosting server is down), it is recommended that you **disable** it (if necessary utilize **Force Disable**).

The **Impact of Upgrade** section in the **Details** tab contains the list of datasets that have been identified as unreachable, misconfigured or not behaving correctly and are at risk of not functioning after the upgrade.

Review the warnings in this section (if any) and take appropriate actions before applying the upgrade.

## Downloading the upgrade image

The upgrade file for the version to which you want to upgrade should be downloaded from the [Delphix download site](#). From 6.0.2.0 onwards, the upgrade images are packaged with the latest version of upgrade pre-checks. Please use the latest upgrade image from the download site since the checks will be updated on a need-by basis.

Delphix Upgrade images are approximately 5GB in size; it is recommended to have both a fast internet connection to the Delphix download site as well as to the Delphix Engine.

The upgrade image should be downloaded or moved to a location accessible to the computer used for navigating the Delphix Management application.

### **Version compatibility and support pre-checks**

Please refer to [Upgrade matrix](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

For upgrades from versions > 5.3.6.0 and < 6.0.0.0, you will download a migration image that is specific to the virtualization platform that your Delphix Engine is running on. The platforms for which images are provided include:

- Amazon AWS
- Microsoft Azure
- VMware ESX

For example, an ESX migration image will have a filename like

```
Delphix_6.0.0.0_2019-12-06-09-07_Standard_ESX_Migration.tar.gz.
```

For upgrades from versions >=6.0.0.0, you will download an upgrade image that is generic to all the virtualization platforms that your Delphix Engine is running on. The Upgrade image will have a filename like

```
Delphix_6.0.1.0_2020-03-17-00-39_Standard_Upgrade.tar .
```

SHA256 checksums, which can be used to verify the integrity of any downloaded files, are available via [download.delphix.com](https://download.delphix.com). Each download link should list a `sha256sum` checksum underneath. Additionally, newer releases may also contain a downloadable SHA256SUMS file, containing the checksums of all files in that directory.

To calculate the checksum of downloaded files, and confirm that they match those in the SHA256SUMS file, the following utilities can be used:

- On Windows, `certutil -HashFile <upgrade.tar.gz> SHA256`
- On macOS or Unix servers with Perl installed, `shasum -a 256 <upgrade.tar.gz>`
- On Unix servers with `coreutils` installed, `sha256sum <upgrade.tar.gz>.`

## Uploading the upgrade image

### **Version compatibility and support pre-checks**

Please refer to [Upgrade matrix](#) before upgrading to a newer version.  
 Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.  
 Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

The procedure for uploading an upgrade version to the Delphix Engine is:

1. Login to the **Delphix Setup** application.
2. In the Software Version panel, click View.

### Dashboard

**Software Version** ⓘ
View

**Engine**

**Current Version**  
 Dynamic Data Platform 6.1.0.0-snapshot.20210913234913859+jenkins-ops-devops-gate-master-appliance-build-master-post-push-6092

**Build Date**  
 Sep 14, 2021 5:13:13 AM

**Latest Version**  
 6.1.0.0-snapshot.20210913234913859+jenkins-ops-devops-gate-master-appliance-build-master-post-push-6092

---

**Data Control Tower Connector**

Enable

3. Click the **plus** icon to upload a new version.
4. Select the upgrade version you downloaded from the download site.

## Upload Upgrade Image

Select upgrade image. Once upload is complete, preparation and verification process will be started.

The new version will be displayed in the Upgrade images list and the progress of the verification will be displayed.

### Upload Status

File not selected

The upload begins on the drop or selection of a file (upgrade image) into the Upload Upgrade Image window. You will be able to view the progress in the Upload Status area.

5. In the Upload Complete dialog, click OK. You will see the new version appear on the page.

Once the upgrade image upload is complete, upgrade verification will start automatically

This verification process will notify you of any potential problems that require intervention from either you or Delphix support. The new version of the Delphix Engine cannot be installed before verification has completed. You can track the progress of verification from the **Actions** sidebar. If issues are found during the verification process, they will be listed on the version page. An upgrade will not be possible until the issues are resolved.

For more details, see [Resolving upgrade checks](#)

## Upgrade verification

### **Version compatibility and support pre-checks**

Please refer to [Upgrade matrix](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

The Delphix Engine provides a feature that allows you to verify an upgrade before applying it. Each new version of the Delphix Engine can introduce new requirements for networking, hypervisor usage, the configuration of Delphix Engine objects and more. Verification can determine if the current Delphix Engine does not meet these requirements. It can also detect if the Delphix Engine is in an unexpected state before an upgrade, in which case the best solution might be to contact support. It is recommended that customers read the [release notes](#) for any version they are upgrading to and look for new Delphix Engine requirements.

As soon as the upgrade image is [uploaded](#), a verification job is started. This verification job will use information stored within the uploaded upgrade image to examine the state of the Delphix Engine and make a best effort to validate that applying the upgrade image will succeed. It also will notify the user of any potential problems that require either customer or support intervention.

After resolving problems noted by the verification process, verification can be run again. It is expected that customers will continue to fix problems and re-verify until no more problems remain, or until none of the remaining problems are critical.

The verification does a “dry run” of some of the upgrade procedures in order to alert the administrator of potential problems before continuing with the upgrade. It is strongly recommended that you perform this verification a day or two in advance, before your upgrade downtime begins, in order to give yourself time to address any problems flagged by the verification. Perform a re-verify closer to the upgrade, when issues have been resolved.

The procedure for verifying an upgrade is:

1. Login to the **Delphix setup** application.
2. In the **System upgrade management** panel, click **View**.
3. On the left-hand side, select the version to which you will be upgrading. Details on the version will be displayed on the right.
4. In the upper right-hand section of the Details tab, click **Verify upgrade**. Verification will run in the background. You can view the different stages with the progress during the upgrade process in the **Action** sidebar.
5. Click the **Verification results** option to view problems during verification.
6. Click the **Verification steps** option to view verification steps in detail.

## Understanding the verification page

This section provides details about various components on the **Verification** page.

<input checked="" type="checkbox"/> Delphix Engine is a replication source - incompatible target version	<b>WARNING</b>
<input type="checkbox"/> Hotfixes not integrated	<b>CRITICAL</b>
<input type="checkbox"/> Hotfix metadata malformed	<b>CRITICAL</b>

**WARNING**

**DESCRIPTION**  
This Delphix Engine is a replication source for another Delphix Engine named awrepl.dc4.delphix.com. As of the last replication, awrepl.dc4.delphix.com was running version 2019.8.8.1, which would not be replication-compatible with this Delphix Engine after upgrade.

**IMPACT**  
Upgrading this Delphix Engine without upgrading the target Delphix Engine(s) may cause replication to fail. Replication is currently only allowed to a target Delphix Engine that is at most two major versions higher than the source Delphix Engine. Replicating to a lower version is not supported. To ensure that these engines will remain replication-compatible, check that the target Delphix Engine(s) are running at least version 2019.8.8.11 and at most two major versions higher than 2019.8.8.11.

## Resolving upgrade checks

### Overview

When verifying an upgrade, the verification job can sometimes detect particular action items called upgrade checks. These checks are items that the Delphix Engine is not capable of fixing on its own, and require customer and/or Delphix support action. Every upgrade check that appears must be resolved or ignored before the upgrade can proceed, with the exception of INFORMATIONAL checks which require no action by users. Below is a workflow for various severity types and upgrade check action.

**Workflow for Severity Types and Upgrade Check Action**

### Upgrade severities checks

Severity	Description
CRITICAL	These checks indicate a potential problem post-upgrade with the Delphix Engine. The Delphix Engine cannot be upgraded while CRITICAL checks are present; it is likely that the engine will fail to upgrade or break catastrophically post-upgrade.

Severity	Description
WARNING	These checks indicate problems that are local to some objects on the Delphix Engine, but the overall engine can continue running. For example, WARNING checks may indicate a problem with the configuration of a particular Windows environment and indicate that if an upgrade occurs, that environment will not function properly.
INFORMATIONAL	These checks provide important information about your upgrade but do not require immediate action.

The following is a list of checks that have been added to the Delphix Engine:

1. **OS tunable settings** (CRITICAL) - Upgrade verification checks that only a certain set of operating system tunables have been adjusted. If tunable settings not on this acceptable list have been changed, please contact Delphix support.
2. **Hotfix** (CRITICAL) - Upgrade verification checks if any hotfixes have been applied to the Delphix Engine, and if any exist that are not resolved in the Upgrade version, this check will generate a Critical result. In this scenario, the Engine may still be upgraded, but we ask that you contact Delphix support to assist in addressing the check.
3. **Snapshot directory visible** (CRITICAL) - This is an internal Delphix Engine problem that Delphix support can resolve for our customers.
4. **Replication** (WARNING) - It indicates that your Delphix Engine has replication set up as either a target or source. Delphix Engines can only perform replication to engines on the same version or higher, so it is recommended to upgrade all Engines in a Replication configuration at the same time, depending on the requirements. For more information on forward-compatible replication, refer to [Replication overview](#).
5. **Storage available** (WARNING) - Upgrade verification checks that there is sufficient space to perform data operations.
6. **SSL/TLS configuration** (WARNING) - Upgrade verification checks that the security configuration of the engine is up to date and properly configured.

An Upgrade check can result in multiple check results. Check results are essentially a to-do list of action items required before performing an upgrade. For example, the OS Tunables will create one line item in the UI for each present tunable that is not on our acceptable list. There are two actions that can be performed on each check result.

### Upgrade check actions

Action	Description
resolve	You have taken the action necessary to solve the problem and complete the action item. Marking a result as resolved means that the customer believes the check result indicated will no longer be a problem. The next verification run will check the result again, but if it is fixed will not create any new check results.

Action	Description
ignore	You have no intention of fixing the problem indicated by the check result. Future verification runs will not generate that check result again if it is present. CRITICAL severity checks cannot be ignored.

Examples of upgrade check actions

Case A: Verification results from critical severity check

Consider a case where Delphix Engine previously had a few hotfixes installed by Delphix Support to resolve an issue. During the upgrade process, a critical severity message is displayed indicating the hotfixes that was used to resolve issue might be lost or reappear after the upgrade.

Hence new upgrade version is missing the root cause fix for that issue. In this example, the action is either to contact Delphix Support or upgrade to a new version that no longer needs these hotfixes. After taking the necessary action, you must mark resolved for the verification steps to complete for a successful upgrade.

It is mandatory to resolve all critical severity errors

Case B: Verification results warning severity check with ignore all warnings

Consider a case where Delphix Engine is configured as a Delphix Replication source for another Delphix Engine. During the upgrade process, a warning message appears because the target engine is on a version that is incompatible with the source engine version.

Hence replication is interrupted until the target engine is upgraded to a newer version.

In this example, the action steps are either to mark the issue as **Mark resolved** or **Mark ignored** because a replication-compatibility is acceptable with a few limitations (as indicated in below warning message).

Verification Report

Verification Package Version 0.0.0

Verification Results
  Verification Steps

Hide Resolved/Ignored

Title	Severity
<input checked="" type="checkbox"/> Delphix Engine is a replication source - incompatible target version	⚠ WARNING
<input type="checkbox"/> Hotfixes not integrated	🔴 CRITICAL
<input type="checkbox"/> Hotfix metadata malformed	🔴 CRITICAL

**⚠ WARNING**

**DESCRIPTION**  
This Delphix Engine is a replication source for another Delphix Engine named awrepl.dc4.delphix.com. As of the last replication, awrepl.dc4.delphix.com was running version 2019.8.8.1, which would not be replication-compatible with this Delphix Engine after upgrade.

**IMPACT**  
Upgrading this Delphix Engine without upgrading the target Delphix Engine(s) may cause replication to fail. Replication is currently only allowed to a target Delphix Engine that is at most two major versions higher than the source Delphix Engine. Replicating to a lower version is not supported. To ensure that these engines will remain replication-compatible, check that the target Delphix Engine(s) are running at least version 2019.8.8.11 and at most two major versions higher than 2019.8.8.11.

[Mark Resolved](#) | [Mark Ignored](#) ⓘ

1 to 3 of 3 First Previous Page 1 of 1 Next Last

All Warnings must either be **Mark resolved** or **Mark ignored**

You also can use **Ignore all warnings** option to disregard all warning messages at once.

### Case C: Verification steps upgrade failure

When you want to see more details about the verification process use the **Verification steps** radio button. Verification Steps is an alternate way to view the verification status. It includes all the steps that were performed by the verification process, the status, description and the duration of the step.

In this example below verification status, **FAIL** indicates that a verification result was generated. In the **Verification results** view, a **FAIL** status on this screen may correspond to a CRITICAL, WARNING, or INFORMATIONAL severity.

## Applying the upgrade

### **Version compatibility and support pre-checks**

Please refer to [Upgrade matrix](#) before upgrading to a newer version.

Customers running version 5.3.9 and earlier that are requesting an upgrade to 6.0.0.0 and above, please contact Delphix Support to help coordinate this upgrade.

Upgrading from 6.0.x to 6.0.x includes pre-checks packaged in the upgrade image, contacting Delphix Support for this upgrade is **not required** (e.g. 6.0.0.0 → 6.0.9.0).

Once you have uploaded an upgrade version, verified the upgrade, optionally reviewed the warnings in the Impact of Upgrade section, scheduled downtime pertaining to the type of upgrade you are performing, you can apply the upgrade.

1. Login to the **Delphix setup** application.
2. In the **Upgrade images** panel, click **View**.
3. On the left-hand side, select the version to which you will be upgrading.
4. Click **Apply upgrade** to initiate the upgrade process.
  - a. For upgrades on engines already running 6.0.0.0 and greater, the user can choose the type of upgrade they want to perform.

The upgrade will run in the background. You can view the progress of the upgrade in the Action sidebar. Only the current system admin user can view the progress.

The status of the upgrade will be visible on the screen - if the upgrade is successful, the page will be redirected to the login view.

If an **Apply now** upgrade fails, the appliance will automatically roll back to the version running prior to the upgrade.

The version page will show the new version in an UPLOADED state and the Action sidebar will show that a rollback was performed. If automatic rollback was disabled through the CLI (not advised), you will have to contact support to proceed further, since you may not even be able to log in to the Delphix Engine.

## Failure to quiesce a dataset

If Upgrade has failed to quiesce a dataset, it will pause and you will see the banner at the top of the **Upgrade** page as shown below:

While the upgrade is paused, datasets that have been quiesced are unavailable until you either roll back or continue the upgrade.

To review the list of failures, open the **Report** tab:

 Upgrade Image - 6.0.10.1

Cancel Upgrade

Retry Upgrade

Continue Upgrade

 Upgrade is unable to quiesce some datasets and has paused.

Version 6.0.10.1 - Paused on failures

**Release Date**  
Oct 29, 2021

**Verify Date**  
Not verified

**OS Version**  
6.0.10.1

**Minimum OS Version**  
6.0.4.0

Verification

**Report**

The datasets listed below were identified as having issues preventing their quiescence, and may not be available after the upgrade is complete.

You can attempt to remedy the issues by:

- Clicking Continue Upgrade (those datasets may not restart after the upgrade)
- Going to the Admin Application in a different browser (e.g. Chrome or IE) or using an incognito window in this browser and resolving issues such as wrong passwords, or stopping the datasets (using Force Disable), then clicking Retry

If you choose to Cancel Upgrade, all changes will be reversed, upgrade will end, and the Engine will be in the state it was in before you started the upgrade.

Filter: none

Info	Source	Hosts	Failure	Action
	VDBOMSR94FDE4_JYH	ac12201.dcol1.delphix.com	Stress option upg.quiesce....	Disable stress options.
	VDBOMSR94FDE4_JYH	ac12201.dcol1.delphix.com	UPGRADE QUIESCE_SOUR...	Try the job again.

The datasets listed in the report were identified as having issues that prevented them from being quiesced, and may not be available after the upgrade is complete. Review the messages in the report and take the suggested corrective actions.

If you think that the errors may be the result of transient failures, you can click **Retry upgrade** to try again. Otherwise, it is recommended that you manually quiesce datasets that are still running. To do so:

1. Use a different browser or use an incognito window to go to the **Delphix management** application.

 Failure to do so might result in losing the current session and you may not be able to return to the Upgrade pause screen.

2. Either resolve issues such as a wrong password or stop the dataset using **Force disable**.
3. In the original browser or window, click **Retry upgrade** to try applying the upgrade again.

If you want to ignore the failures to quiesce datasets and proceed with the upgrade:

1. Click **Continue upgrade**. This will attempt to quiesce all datasets which have not yet been quiesced, but will not pause on failures.

**Note** : This may result in datasets remaining unavailable after the upgrade is complete and the Delphix Engine restarts, since the underlying storage that backs the datasets will be unreachable during the

upgrade. This may cause the databases or applications to failover or transition to a failure state, thus requiring administrator intervention to recover.

2. Review the messages in the report and take the suggested corrective actions.
3. If any of the listed datasets are critical, and you are unable to resolve the configuration errors in the report, you can **Rollback** the upgrade. If you choose **Rollback**, all changes will be reversed, the upgrade will end, and the Delphix Engine will be in the state it was in before you started the upgrade.

## Post upgrade

After the upgrade is done, you will be redirected back to the login page.

Login to **Delphix setup** to make sure that the upgrade succeeded and that the new version is running.

A **post-upgrade cleanup** job is run automatically after the upgrade is done. This job refreshes environments and re-enables sources to bring objects back into a working state. VDB access will not be available at all until the environments have been refreshed and the objects are re-enabled by the job **Perform cleanup tasks following a Delphix engine upgrade**.

## Failures

If you used **Continue upgrade** to force the upgrade as is described in [Failure to quiesce a dataset](#), the **Report** tab will contain the list of pre-upgrade quiesce failures. Upgrade will make a best effort to restore functionality to these datasets, but it may still hit the same errors that prevented the datasets from being quiesced successfully before the upgrade. You may need to manually bring up these datasets on the target hosts.

# Security

## Security

Given that the Delphix software is meant to interact with some of your organization's most important application data, security is very important. The security section covers everything you need to know about how you can manage the Delphix software securely (user management, etc) as well as how Delphix works to ensure that the software is not susceptible to vulnerabilities. This section outlines standard hardening techniques that you should apply to every Delphix Engine in your environment. The Delphix Engine delivers its functionality through a web-based graphical user interface (GUI), web-based RESTful APIs, and a command-line interface (CLI) accessed over SSH. All three interfaces leverage the same accounts and privileges scheme. Access to the Delphix Operating System (DxOS) is restricted to Delphix Support and Delphix Professional Services and can be controlled through the Support Access Control mechanism, described below. Customer-specific software installations and modifications to the DxOS are not required or supported. Communications to/from connected systems ("sources" and "targets") should be limited to required ports, and encryption should be used wherever possible.

### [Security principles](#)

### [Product security](#)

### [Object security](#)

### [System configuration](#)

### [GUI security](#)

### [Masking sensitive data](#)

### [Audit logs](#)

### [Support security](#)

### [Password policies](#)

### [Additional topics](#)

## Security principles

The Delphix approach is based on:

**Embrace separation of duties:** Isolate and compartmentalize capabilities and privileges and never give or concentrate access to a single role.

**Apply the principle of least privilege:** Users should obtain only those privileges needed to do their jobs and only for as long as they are needed.

**Use an open, simple design:** Make security mechanisms simple and easy to use, and rely on proven, peer-reviewed solutions.

**Use a layered defense:** Provide no single point of failure; if one layer fails to catch an error, catch it in another layer.

**Use complete mediation and authentication:** Control and check every access point every time.

**Use fail-safes:** Deny access when not explicitly authorized. Prevent faults from causing an opportunity to compromise.

**Protect data at rest and data in motion:** Utilize common security protocols as well as features of the source database and database software to protect data at all times.

**Minimize the attack surface:** Present the minimum sockets, services, webpages, and accounts necessary to operate.

**Don't rely on obscurity:** Be secure even if everything but the key is known.

**Audit and monitor everything:** Provide a tamper-proof trail of evidence.

**Leverage the environment:** Design the Delphix Engine to leverage the security features offered by databases, operating systems, storage devices, and networks.

**Anticipate external attack vectors:** Combat attacks sourced from connected systems.

**Enforce strong credentials:** Define and enforce password policies.

## Product security

This section covers the following topics:

- [Delphix product security](#)
- [Software updates](#)
- [Network security](#)
- [Password vault support](#)
- [Certificate management](#)
- [Replication security](#)

## Delphix product security

### Overview

Delphix takes an active approach towards the discovery of vulnerabilities by employing third-party VAPT (vulnerability and penetration testing) Teams on an annual basis, as well as actively reviewing additional tools to assess our products. We also actively monitor bugs and vulnerabilities against the list of open-source software which is integrated into our products.

Delphix investigates all known vulnerabilities, either found by customers or internally, or discovered by the VAPT Teams. During the course of this investigative process, Delphix works with the reporter of the vulnerability to gather the technical information and determine the appropriate remedial action.

Customers can perform their own security scans and audits using their access through application administrative accounts. Because operating system administrative access is not provided with the closed software virtual appliance, scans executed with this privilege level are consistent with the level of access available in the environment.

As needed, we provide compensating controls and mitigations to reduce the impact of security issues more quickly and deliver fixes as part of the standard software release process described above.

### Software delivery security

We deliver our virtual software appliance and upgrade images to customers on a secure server with access control. Additionally, we provide cryptographic signatures for each image, and customers can use these signatures to ensure the software images have not been tampered with.

### Ancillary components

The virtual appliance communicates with target servers running virtual databases (VDBs). The software is pushed to target servers to facilitate communication for Oracle and SQL Server databases. (Oracle toolkit and Delphix connector, respectively). This software lives outside of the DDDP product appliance, and new versions of the DDDP product will provide updated versions of this software as well.

## Software updates

Keeping Software up to date is an important part of any hardening plan. Delphix software releases are cumulative and include bug fixes, new features, and security improvements. In addition, Delphix releases hotfixes, procedures, and workarounds for critical vulnerabilities.

### Patch annually

To stay up to date, patch your Delphix Engine at least once per year. If you do not, you might have to upgrade twice to get the latest releases, and your old installed version will not be able to receive vulnerability fixes.

If possible, patch more frequently. Depending on the version you are upgrading from/to, you may be able to avoid or defer the reboot sequence, which defers downtime for your virtual databases (VDBs). This allows you to patch outside of downtime windows.

### Subscribe to Delphix notifications

Delphix issues email notifications when critical vulnerabilities are discovered. Registered support accounts will automatically receive these notifications. To ensure that you receive these notifications:

- Register at least two Engine Admins with Delphix Support
- Add Delphix Support accounts when Engine Admins leave the company

## Network security

Review the official documentation for the full list of required ports, *which depends on your database vendor*. Open only those ports that are required. The following table only lists generic requirements; you will need additional ports to integrate with databases.

### Ports

Open only required ports.

## General port allocation

The Delphix Engine makes use of the following network ports irrespective of the type of database objects on it:

### General outbound port allocations

Protocol	Port numbers	Use
TCP	21	Passive FTP connections from the Delphix Engine to the Delphix FTP server. Used for sending logs to Delphix Support.
TCP	25	Connection to a local SMTP server for sending email.
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
TCP/UDP	389	Standard access to an LDAP server
TCP/UDP	636	Secure access to an LDAP server
TCP	1023	Used to complete the passive FTP connection from the Delphix Engine to Delphix Support. These ports are not used if Delphix uses a proxy server to connect to the Internet.
TCP	8415	A Delphix replication source will connect to the replication target using this destination port

### General inbound port allocations

Protocol	Port numbers	Use
TCP/UDP	22	SSH connections to the Delphix Engine

<b>Protocol</b>	<b>Port numbers</b>	<b>Use</b>
TCP	80	HTTP connections to the Delphix GUI
TCP	443	HTTPS connections to the Delphix GUI
TCP	8415	A Delphix replication target will accept incoming connections to this port from the replication

## Password vault support

### Overview

More and more organizations use Enterprise Password Vaults (EPV) such as CyberArk and HashiCorp Vault to store securely and centrally manage identities and credentials. Delphix has added CyberArk, HashiCorp and Azure Key Vault support to the Delphix Virtualization Engine as a new authentication option for environments and databases. This minimizes the number of places where credentials need to be stored and, therefore the risk of insecure storage.

The Delphix Engine uses various authentication methods such as username/password, username/ssh key, and Kerberos credentials when connecting to hosts and databases from the Engine. These credentials are stored on the Delphix Engine in an encrypted format and can be retrieved later to perform various operations. Delphix provides an additional authentication method by integrating Virtualization with the most common vault types (CyberArk, HashiCorp, Azure Key Vault). At runtime, Delphix retrieves the credentials (passwords, ssh keys) from the customer's vault servers via API calls and avoids managing customer passwords.

### Configuring password vaults

In the Setup app, system administrators can manage (add, delete, modify, and validate) vault configurations during and after the initial setup. Each engine can have multiple vaults configured of any type.

The authentication method supported for CyberArk is Certificate-based. Configuring a CyberArk vault requires providing a host address, port number, application ID, and a client certificate (certificate chain and private key).

The authentication methods supported for HashiCorp vaults are Token-based, AppRole-based, and Certificate-based. Configuring a HashiCorp vault requires providing a token ID or a role ID and secret ID or a client certificate along with the host address and port number. For HashiCorp Enterprise vaults, a namespace can also be provided.

The authentication method supported for Azure Key Vault is Client-Secret-based. Configuring an Azure Key Vault requires providing the Azure tenant ID, client ID, and client secret.

### Using password vaults

The Virtualization engine retrieves credentials at runtime from a vault using a unique identifier that locates a set of credentials in a configured vault. This occurs for any activity that requires Environment access (SnapSync, Validated Sync, LogSync, as well as Environment monitoring). This may result in a significant number of requests, so any existing connection rate limits should be evaluated and adjusted accordingly. For CyberArk, the unique identifier consists of a query string. For HashiCorp Vault, it consists of four parameters: engine, path, and a pair of keys that locate the username and secret (password or SSH key) in the key-value store at that engine and path. For Azure Key Vault, it consists of the Azure Vault Name (also known as the Resource Name within Azure Vault, not to be confused with the vault name that identifies the vault in the engine), username key, and secret key.

To set up an environment or database user to use a vault, use the credential type **VaultCredential** when adding/modifying such users and specify the vault and the unique identifier of the credentials.

### Roles and privileges for CyberArk and HashiCorp users

Role	Privileges
System Administrator	Can add, modify, delete, and list vault configurations.

Role	Privileges
Delphix Administrator	Can list existing vault configurations and link environment and database users to vault credentials.

### Supported environments and databases

All environment users can use vault credentials. For Windows, the initial link via the Delphix Connector does not support vaults, but environment users can be subsequently updated to use vaults.

Vault integration is currently supported for SAP ASE database users, Oracle database users, and MSSQL domain users using 6.0.4 and later.

### Setting up a vault via GUI

Complete setup via the GUI is available for CyberArk as of 6.0.3.0, for HashiCorp as of 6.0.4.0 and for Azure Key Vault as of 10.0.0.0.

1. Connect to the Delphix Engine <http://>
2. Add a CyberArk or HashiCorp CA certificate to the TrustStore as part of the initial configuration. Refer [TrustStore Settings](#) for steps to add a CA certificate.
3. Click on the **Modify** link in the top right of the **Network Authorization** panel.

4. On the Network Authorization window, click "+" to add a new vault.
5. Enter the following information: Depending upon your requirements, you can set the configurations for CyberArk, HashiCorp, or Azure Key vault.

Field	Possible value and data Type	description
<b>Vault Type - CyberArk</b>		
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	cyberark02.delphix.com Accepts a URL string value	Specifies the location of the user's vault server
Port	443 Accepts an integer value	Specifies the port number through which the communication will happen
App ID	DelphixQADSA Accepts a string value	Specifies an application ID registered with and provided by CyberArk
Authentication Certificate	-----BEGIN CERTIFICATE----- <certificate> -----END CERTIFICATE----- Accepts a string value	Specifies the authentication certificate provided by CyberArk
Private Key	<CyberArk-provided> Accepts a string value	Specifies the private key provided by CyberArk for TLS based authentication
<b>Vault-Type - HashiCorp</b>		
<b>Authentication method</b>	<b>Token</b>	
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	10.119.132.39 Accepts a URL string value	Specifies the location of the customer vault server
Port	8100 Accepts an integer value	Specifies the port number through which the communication will happen

Field	Possible value and data Type	description
Vault Namespace	purple Accepts a string value	Specifies the namespace configuration specific to the user environment that is provided by the HashiCorp Enterprise Platform
Token	s.2xvGgVRW53Ug6TXbCB7hj6a6 .waR7a Accepts a string value	Specifies the token specific to the user environment that is provided by the HashiCorp Enterprise Platform
<b>Authentication method</b>	<b>AppRole</b>	
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name
Vault Hostname	10.119.132.39 Accepts a URL string value	Specifies the location of the customer vault server
Port	8100 Accepts an integer value	Specifies the port number through which the communication will happen
Vault Namespace	purple Accepts a string value	Specifies the namespace configuration specific to the user environment. This feature is provided with the HashiCorp Enterprise Platform
RoleID	f02b1a68-2c62-1230- e8dc-92424dea6468 Accepts a string value	Specifies the RoleID specific to the user environment
SecretID	ca3aca0c-254a-3f61- c943-0210fd670658 Accepts a string value	Specifies the SecretID specific to the user environment
<b>Authentication method</b>	<b>Certificate</b>	
Vault Name	<user-specified> Accepts a string value	Specifies the user-specified vault name

Field	Possible value and data Type	description
Vault Hostname	10.119.132.39 Accepts a URL string value	Specifies the location of the customer vault server
Port	8100 Accepts an integer value	Specifies the port number through which the communication will happen
Vault Namespace	purple Accepts a string value	Specifies the namespace configuration specific to the user environment. This feature is provided with the HashiCorp Enterprise Platform
Authentication Certificate	-----BEGIN CERTIFICATE----- <certificate> -----END CERTIFICATE----- Accepts a string value	Specifies the authentication certificate provided by HashiCorp for TLS based authentication
Private Key	ca3aca0c-254a-3f61- c943-0210fd670658 Accepts a string value	Specifies the private key specific to the user environment that is provided by HashiCorp for TLS based authentication
Role Name (Optional)	purple-admin-role Accepts a string value	Specifies the certificate role name for TLS based authentication

6. Click **Validate** to check the configurations before saving the vault details. The below screenshot shows an example of the HashiCorp Vault configuration.

**vault Name**

#### Editing a vault via the GUI

1. Connect to the Delphix Engine [http:// <Delphix Engine>/login/index.html#serverSetup](http://<Delphix Engine>/login/index.html#serverSetup).
2. Click on the **Modify** link in the top right of the **Network Authorization** panel.
3. In the **Network Authorization** window, select a vault, then the **pencil** icon.
4. Edit your configuration.
5. Select **Edit**.

#### Deleting a vault via the GUI

1. Connect to the Delphix Engine [http:// <Delphix Engine>/login/index.html#serverSetup](http://<Delphix Engine>/login/index.html#serverSetup).
2. Click on the **Modify** link in the top right of the **Network Authorization** panel.
3. In the **Network Authorization** window, select a vault, then select the **trashcan** icon.
4. Select **Yes** to delete the vault.

#### Adding a host user for HashiCorp

1. Login to the **Delphix Management Application** and select **Manage > Environments**.
2. Select Add **Environment**.
3. In the **Environment Setting** tab, select **Password Vault** as the Login Type.
4. Select the vault configuration and provide the secret engine name, path, and keys for the username secret and complete your environment configuration.
5. The environment will be created with the primary user using vault credentials.

## Setting up a vault via CLI

1. Login as a system administrator and add a CyberArk or HashiCorp CA certificate to the TrustStore as part of the initial configuration.

2. SSH to <Delphix Engine IP>service passwordVault and enter **create**.

```
ip-10-110-230-197 service passwordVault>create
```

3. Add a new vault configuration by entering a name, host, port, applicationId, client certificate, and private key.

```
ip-10-110-230-197 service passwordVault create
Properties
type: CyberArkPasswordVault
name: DemoVault (*)
applications: Delphix (*)
clientCertificate:
  type: PemClientCertificate (*)
  clientCertificateChain: (required)
  privateKey: (required)
host: services-uscentral.skyop.com (*)
port: 17993 (*)
```

4. Add a new HashiCorp vault configuration by entering a name, host, port, and other authentication information based on the authentication method (Token/AppRole/Certificate) selected.

## HashiCorp - Token Based Authentication

```
ip-10-110-230-197 service passwordVault create
Properties
type: HashiCorpVault (*)
name: HashiCorpDemoVault (*)
authentication:
  type: HashiCorpTokenAuthentication (*)
  token: ***** (*)
host: 10.119.132.40 (*)
port: 8200 (*)
```

## HashiCorp - AppRole Based Authentication

```
ip-10-110-230-197 service passwordVault create
Properties
type: HashiCorpVault (*)
name: HashiCorpDemoVault (*)
authentication:
  type: HashiCorpAppRoleAuthentication (*)
  roleId: 20d19a46-6fd9-c78b-b7e3-e43be4c8d5c2 (*)
  secretId: ***** (*)
host: 10.119.132.40 (*)
port: 8200 (*)
```

## HashiCorp - Certificate Based Authentication

```
ip-10-110-230-197 service passwordVault create
Properties
  type: HashiCorpVault (*)
  name: HashiCorpDemoVault (*)
  authentication:
    type: HashiCorpCertificateAuthentication (*)
    clientCertificate:
      type: PemClientCertificate (*)
      clientCertificateChain: (required)
      privateKey: (required)
    roleName: (unset)
  host: 10.119.132.40 (*)
  port: 8200 (*)
```

## Updating an existing vault configuration

```
ip-10-110-230-197 service passwordVault> select DemoVault
ip-10-110-230-197 service passwordVault 'DemoVault'>update
ip-10-110-230-197 service passwordVault 'DemoVault'update *> set name=TestVault
ip-10-110-230-197 service passwordVault 'DemoVault'update *> commit
ip-10-110-230-197 service passwordVault 'TestVault'>
```

## Deleting an existing vault configuration

```
ip-10-110-230-197 service passwordVault 'TestVault'> delete
ip-10-110-230-197 service passwordVault 'TestVault' delete *> commit
ip-10-110-230-197 service passwordVault>
```

## Adding/Modifying host users

Add an environment with user credentials from CyberArk vault. When adding a host/database user with a vault credential, the name field would be a user identifier and not the actual username. In case this field is empty, a unique identifier is generated with a hash of vault credentials.

```
ip-10-110-230-197 environment create *> set hostEnvironment.name=bbh-env
ip-10-110-230-197 environment create *> set hostParameters.host.address=bbdhcp-vault-
demo.dlpX.co
ip-10-110-230-197 environment create *> set hostParameters.host.toolkitPath="/work"
ip-10-110-230-197 environment create *> set primaryUser.name=oracleUser
ip-10-110-230-197 environment create *> set
primaryUser.credential.type=VaultCredential
ip-10-110-230-197 environment create *> set primaryUser.credential.vault=DemoVault
ip-10-110-230-197 environment create *> set
primaryUser.credential.vaultCredentialId="safe-test;folder=root;object=UnixSSH-
sybase"
```

```

ip-10-110-230-197 environment create *> commit
`UNIX_HOST_ENVIRONMENT -6
Dispatched job JOB-33
ENVIRONMENT_CREATE_AND_DISCOVER job started for "bbh-env".
ENVIRONMENT_CREATE_AND_DISCOVER job for "bbh-env" completed successfully.

```

### Adding/Modifying **database users**

Add dSource using database credentials from CyberArk vault.

```

ip-10-110-230-197 database link *> set name=fuji
ip-10-110-230-197 database link *> set group=Untitled
ip-10-110-230-197 database link *> set linkData.config=ASE_SI_CONF-70
ip-10-110-230-197 database link *> set linkData.dbUser=sybaseUser
ip-10-110-230-197 database link *> set linkData.dbCredentials.type=VaultCredential
ip-10-110-230-197 database link *> set linkData.dbCredentials.vault=DemoVault
ip-10-110-230-197 database link *> set
linkData.dbCredentials.vaultCredentialId="safe-test;folder=root;object=Database-
Sybase-sa"
ip-10-110-230-197 database link *> set linkData.loadBackupPath='/opt/sybase/dumps'
ip-10-110-230-197 database link *> set linkData.sourceHostUser=HOST_USER-7
ip-10-110-230-197 database link *> set linkData.stagingHostUser=HOST_USER-7
ip-10-110-230-197 database link *> set linkData.stagingRepository=ASE_INSTANCE-6
ip-10-110-230-197 database link *> set
linkData.syncParameters.type=ASENewBackupSyncParameters
ip-10-110-230-197 database link *> commit
`ASE_DB_CONTAINER-1
Dispatched job JOB-39
DB_LINK job started for "Untitled/fuji".
DB_LINK job for "Untitled/fuji" completed successfully.

```

### Update Existing Database Users

Convert an existing database to use vault credentials for the existing database user.

```

ip-10-110-230-197 > sourceconfig
ip-10-110-230-197 sourceconfig > select MyOraDB
ip-10-110-230-197 sourceconfig "MyOraDB" > update
ip-10-110-230-197 sourceconfig "MyOraDB" *> set
credentials.type=CyberarkVaultCredential
ip-10-110-230-197 sourceconfig "MyOraDB" *> set credentials.vault=MyVault
ip-10-110-230-197 sourceconfig "MyOraDB" *> set credentials.queryString="safe-
test;folder=root;object=UnixSSH-delphix_db"
ip-10-110-230-197 sourceconfig "MyOraDB" *> set db_user="Vault-User"
ip-10-110-230-197 sourceconfig "MyOraDB" *> commit

```

- The set `db_user="Vault-User"` is an optional step. If the `db_user` field is not changed, then it will continue to hold the old value. This value may no longer be correct, or the change to Vault credentials may represent an increase in the customer's security stance, and they may not want their Delphix Admins to know the username.

## Setting up Vault via API

The vault API allows users to add, modify, delete, and list vault configurations and retrieving user credentials on a Delphix Engine.

Endpoint - <https://<Delphix Engine IP>/resources/json/delphix/service/passwordVault>

### Sample API Request

```
{
  "type": "CyberArkPasswordVault",
  "name": "DemoVault",
  "host": "services-uscentral.skytap.com",
  "port": 17993,
  "applicationId": "Delphix",
  "clientCertificate": {
    "type": "PemClientCertificate",
    "privateKey": "-----BEGIN PRIVATE KEY-----<>-----END PRIVATE KEY-----",
    "clientCertificateChain": {
      "type": "PemCertificateChain",
      "chain": [
        {
          "type": "PemCertificate",
          "contents": "-----BEGIN CERTIFICATE-----<>-----END
CERTIFICATE-----"
        }
      ]
    }
  }
}
```

### Deleting an existing vault configuration

```
{
  "type": "CyberArkPasswordVault",
  "name": "DemoVault",
  "host": "services-uscentral.skytap.com",
  "port": 17993,
  "applicationId": "Delphix",
  "clientCertificate": {
    "type": "PemClientCertificate",
    "privateKey": "-----BEGIN PRIVATE KEY-----<>-----END PRIVATE KEY-----",
    "clientCertificateChain": {
```

```

        "type": "PemCertificateChain",
        "chain": [
            {
                "type": "PemCertificate",
                "contents": "-----BEGIN CERTIFICATE-----<>-----END
CERTIFICATE-----"
            }
        ]
    }
}

```

#### Adding/Modifying host users

Add an environment with user credentials from CyberArk vault. When adding a host/database user with a vault credential, the name field would be a user identifier and not the actual username. In case this field is empty, a unique identifier is generated with a hash of vault credentials.

```

{
  "type": "HostEnvironmentCreateParameters",
  "primaryUser": {
    "type": "EnvironmentUser",
    "credential": {
      "type": "VaultCredential",
      "vault": "CYBERARK_PASSWORD_VAULT-1",
      "vaultCredentialId": "safe=test;folder=root;object=UnixSSH-sybase"
    }
  },
  "hostEnvironment": {
    "type": "UnixHostEnvironment",
    "name": "bbh-env"
  },
  "hostParameters": {
    "type": "UnixHostCreateParameters",
    "host": {
      "type": "UnixHost",
      "address": "bbdhcp-vault-demo.dlpxdc.co",
      "toolkitPath": "/work"
    }
  }
}

```

#### Adding/Modifying **database users**

Add dSource using database credentials from CyberArk vault.

The following a sample API link request for MSSQL Domain User.

```

{
  "type": "LinkParameters",

```

```
"name": "ReportServer",
"group": "GROUP-1",
"linkData": {
  "type": "MSSqlLinkData",
  "config": "MSSQL_SINGLE_CONFIG-5",
  "sharedBackupLocations": [],
  "encryptionKey": "",
  "sourceHostUser": "HOST_USER-3",
  "mssqlUser": {
    "password": {
      "type": "VaultCredential",
      "vault": "CYBERARK_PASSWORD_VAULT-2",
      "vaultCredentialId": "safe=test;folder=root;object=Database-MSSql-addtully"
    },
    "type": "MSSqlDomainUser"
  },
  "pptRepository": "MSSQL_INSTANCE-4",
  "pptHostUser": "HOST_USER-3",
  "ingestionStrategy": {
    "validatedSyncMode": "TRANSACTION_LOG",
    "type": "ExternalBackupIngestionStrategy"
  },
  "sourcingPolicy": {
    "logsyncEnabled": false,
    "type": "SourcingPolicy"
  },
}
```

```
"syncParameters": {  
  "compressionEnabled": false,  
  "backupPolicy": "PRIMARY",  
  "type": "MSSqlNewCopyOnlyFullBackupSyncParameters"  
}  
}  
}
```

## Certificate management

The Delphix Dynamic Data Platform uses SSL certificates to secure a number of different communications. Delphix now provides users with the ability to manage their own certificates for HTTPS and DSP (Delphix Session Protocol) connections to and from the Delphix Engine. Users are able to see multiple certificates, their attributes, and deployed status, they can also:

- Replace certificates
- Delete certificates
- Create CSRs (certificate signing requests)

## Configuring network security settings

To enable and modify the extent of security settings for HTTPS and DSP (Delphix Session Protocol), click on the “Settings” button in the top right of the “Network Security” panel. This will open a new wizard where you can modify the settings.

Configuring settings for HTTPS and DSP.

The following procedure guides you through the process of enabling or modifying security settings for HTTPS and DSP.

1. Connect to the Delphix Engine <http://<Delphix Engine>/login/index.html#serverSetup>
2. Click on the **Settings** link in the top right of the **Network Security** panel. This will open a new wizard where you can modify the settings.

**Network Security**
[Settings](#)

[Certificate Information?](#)

**CUSTOM AUTHORIZATIONS**

**Perform Server (target engine) authorization for Replication**  
Disabled

**Perform Client (source engine) authorization for Replication**  
Disabled

**Perform Server (this engine) authorization for remote connections**  
Disabled

**Perform Client (target host) authorization for remote connections**  
Disabled

**Perform Server (this engine) authorization for network test remote connections**  
Disabled

**Perform Client (target engine or host) authorization for network test remote connections**  
Disabled

- In the **Network Settings** wizard, you can modify the **HTTP mode**, **TLS Version**, and **TLS Cipher Suites** to be used.

## Network Security Settings

4. Click **Next**.
5. By default, self-signed certificates are used for server authentication and username/password login acts as client authorization. You can enable the use of custom certificates and modify the extent of how they are used for the following features:

- [Replication](#)
- [Remote host connections](#) (SnapSync, Remote hosts for Target or Server environments, and Oracle V2P)
- [Throughput tests](#) using the Network Performance Tool and DSP

**Info:** For all three features, Server authentication must be enabled for Client authentication to take effect.

**Note:** Any configuration change requires a stack restart to take effect. Submitting the Network Security Settings in the GUI will automatically trigger a stack restart. All jobs will be stopped, but VDBs will continue to run.

## Network Security Settings

6. Once the HTTP and DSP configurations have been set as desired, click **Next**.
7. You will be presented with a Summary tab. Clicking **Submit** to accept your changes will trigger a stack restart as this is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

## Certificate management and remote connections

### Overview

The server is the Delphix engine and the client is the remote host. This can be used for SnapSync, Oracle V2P (Virtual to Physical), and remote host connections. Once either of these options is enabled, the steps for adding certificate must be done for all environments in the engine.

### Enabling server authentication

To enable server authentication, follow the below steps:

1. Replace the desired certificate for DSP (Delphix Session Protocol) in the engine KeyStore. For more details, refer to [KeyStore Settings](#)
2. Create a JKS or PKCS#12 keystore on the remote host with the full CA chain of the replaced certificate. Make sure the created keystore has permissions such that it is readable by all environment users configured in Delphix, and enter the keystore details into the host's truststore configuration on the engine. For more details, refer to [Host DSP Configuration](#)
3. Select **Perform server (this engine) authorization for remote connections.**

 Altering the authentication settings will require DSP keystore and truststore parameters to be configured for all existing environments, if not the refreshing of existing host environments will fail.

### Enabling client authentication

1. DSP connector (for both Windows and Unix hosts)

**To enable client authentication using DSP connector, first enable server authentication (refer to the above steps), then follow the below steps:**

1. Create a JKS or PKCS#12 keystore on the remote host with the desired key pair. Make sure the created keystore has permissions such that it is readable by all environment users configured in Delphix, then enter the keystore details into the host's keystore configuration on the engine. For more details, refer to [Host DSP Configuration](#)
2. Add the full CA chain of the remote host's key pair to the TrustStore on the engine. For more details, refer to [TrustStore Settings](#)
3. Select **Perform Client (the target host) authorization for remote connections.**
4. Once the configurations have been set as desired, you will be presented with a summary page. Clicking **Submit** will trigger a stack restart, which is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

2. Connector installer connector (specific for Windows hosts)

There are two ways to generate self signed certificates :

- a) By [Installing the Delphix Connector](#), which will by default create certificates.
- b) By using [Self-signed Certificates](#)

**To enable client authentication using connector installer, you must perform the below steps for all Windows hosts, which are being added to the Delphix Engine:**

1. Execute the below command to generate the PEM file for the Delphix Connector (provided or [self-signed](#))Java KeyStore file. Also, input the store password from the `DelphixConnector.properties` when prompted.

```
keytool -exportcert -alias DelphixConnector-  
{UUID_From_DelphixConnector.properties} -keystore "{Installation_Dir}  
\connector\DelphixConnector.jks" -rfc -file {Custom_PEM_File_Name}
```

2. Copy the PEM's file content and paste it while adding the certificate into the Delphix Engine.
3. Add the certificate to Delphix engine using the **sysadmin** login and select **Network Security**.
4. Select **Add Certificate** and upload the certificate.
5. Once the certificate is added, enable `validateWindowsConnectorCertificate` from the Delphix engine CLI. This will restart the Delphix engine.

## Certificate management and replication

In Replication, the Server is the Target engine and the Client is the Source engine.

### Enabling server authentication

To enable Server Authentication, do the following:

1. Replace the desired certificate for DSP (Delphix Session Protocol) in the Target engine KeyStore. For more details, refer to [KeyStore Settings](#)
2. Add the full CA chain of the replaced certificate from the Target engine to the TrustStore on the Source engine. The CA chain must match on both engines. For more details, refer to [TrustStore Settings](#)
3. Select the option **Perform Server (target engine) authorization for Replication** for both Target and Source engines.

### Enabling client authentication

To enable Client Authentication, enable Server Authentication (refer to above steps), then do the following:

1. Replace the desired certificate for DSP in the Source engine KeyStore. For more details, refer to [KeyStore Settings](#)
2. Add the full CA chain of the replaced certificate from the Source engine to the TrustStore on the Target engine. The CA chain must match on both engines. For more details, refer to [TrustStore Settings](#)
3. Select the option Perform Client (source engine) authorization for Replication for both Target and Source engines.
4. Once the configurations have been set as desired, you will be presented with a summary page. Clicking **Submit** will trigger a stack restart as that is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

## Certificate management for throughput tests

### Enabling server authentication

To enable Server Authentication, do the following:

1. If using the engine to engine tests, follow the steps for [Replication Server Authentication](#)
2. If using the engine to host tests, follow the steps for [Remote Connections Server Authentication](#)
3. Select the option **Perform Server (this engine) authorization for remote connections.**

### Enabling client authentication

To enable Client Authentication, enable Server Authentication (refer to above steps), then do the following:

1. If using the engine to engine tests, follow the steps for [Replication Client Authentication](#)
2. If using the engine to host tests, follow the steps for [Remote Connections Client Authentication](#)
3. Select the option **Perform Client (target engine or host) authorization for remote connections.**
4. Once the configurations have been set as desired, you will be presented with a summary page. Clicking **Submit** will trigger a stack restart as that is necessary for the configuration changes to take effect. Note: all jobs will be stopped, but VDBs will continue to run.

Delphix Engine generates alerts when certificates in the Keystore or truststore are expired or about to expire:

- A warning level alert is generated if certificates are expiring in 60 days.
- Critical level alerts are generated if certificates expire in 14 days or have already expired.

## Configuring HTTP settings for the Delphix engine

Use the following steps to configure HTTP settings for the Delphix Engine.

1. Login to the Delphix Engine Setup UI as a sysadmin.
2. From the Dashboard under **Network Security** select **Settings**. This will open a new wizard where you can modify the settings.
3. In the **Network Security Settings** screen, you can modify the **HTTP mode**, **TLS Version**, and **HTTPS Ciphers** to be used.
4. In **HTTP mode**, select one of the following:**HTTP Only**: accepts only HTTP connections.
  - a. **HTTPS Only**: accepts only HTTPS connections.
  - b. **HTTP Redirect**: Redirect all requests made over HTTP to HTTPS.
  - c. **HTTP and HTTPS**: accepts both HTTP and HTTPS connections.
  - d. **HTTP Redirect with HSTS**: redirect all requests made over HTTP to HTTPS and add Strict-Transport-Security Header to all responses.
5. In **TLS Version**, select the required TLS versions.
6. In **HTTPS Ciphers**, select the required option from the drop-down list. Select the check box next to **Select All** if you want to select all the options.
7. Click **Next** and then click **Submit** to allow your engine to restart for the changes to take effect.
8. When the Delphix Engine homepage is loaded after the restart, all the HTTP requests will be redirected to the selected HTTP mode after the first load.

 The above steps might not work if:

1. The certificates are not trusted - 'not secure' warning on the search bar of the browser. Certificate setup should be completed before setting up HSTS headers for them to be useful - otherwise, the redirect will still happen over 302 status.
2. Your site is not prepared for HTTPS setup - i.e., each of the subdomains accessed should be supporting HTTPS - parts of the application might be inaccessible otherwise.
3. Every first request whenever the cache is cleared would redirect over 302. Any further requests after the first would redirect over 307.

## Don't want to use HSTS?

1. By default engine is set up to 'HTTP and HTTPS'. You can leave the engine as it is and not make any changes.
2. If you set up HSTS and want to revert it, the same steps for setup can be followed from above, and select your previous option on step 3.

## Regenerating self-signed end-entity and CA certificates

**i** In many environments, the replacement of HTTPS and/or DSP may be unnecessary.

DSP certificate is only relevant if Custom Authorizations have been configured in Network Security settings, as discussed in the [Configuring Network Security Settings](#) article. If these checkboxes are not applied, this means the DSP certificate is not being used.

HTTPS certificate replacement is only necessary if HTTPS connections are used for web browser access.

The following process will leverage Java *keytool* utility. This is commonly available in most Java JDK installations, including those installed in the Delphix Toolkit for Unix, Linux, and Windows Environments under `<toolkit directory> /*host/java/jdk/bin/`. In the following example, `/work` is the toolkit directory. The subdirectory naming conventions from 5.3.x and 6.0.x are illustrated as:

```
$ find /work -name keytool
/work/Delphix_COMMON_f126df603015_33e2f61712c3_2_host/java/jdk/jre/bin/keytool
/work/Delphix_COMMON_f126df603015_33e2f61712c3_2_host/java/jdk/bin/keytool
/work/Delphix_COMMON_564d56b0_26ad_e6ac_f782_d15213207664_oracle_host/java/jdk/bin/
keytool
/work/Delphix_COMMON_564d56b0_26ad_e6ac_f782_d15213207664_oracle_host/java/jdk/jre/
bin/keytool
```

By the end of this process, a PKCS#12 keystore file is generated containing the CA certificate, DSP, and HTTPS certificate. This file will be used for upload twice in the System Setup interface.

### Other notes:

- The recommended keystore password 'changeit' is used.
- For `<domain>`, replace this string with the Engine FQDN in every command. This is used as the CN (Common Name). For instance, `"-dname 'CN=Engine <domain> ca,="" c="">"` would be replaced with `"-dname 'CN=Engine example.delphix.com CA, C=US'"`.
- The certificate aliases to be used are 'tomcat' for HTTPS and 'dsp' for DSP.
- The existing Delphix CA certificate in the truststore cannot be removed. Faults related to this certificate should be ignored.

### 1. Generate a new Delphix CA Certificate.

```
PASSWORD_ENV='changeit' keytool -genkeypair -noprompt -alias delphixca
-keyalg RSA -keysize 2048 -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext bc=ca:true
-ext ku=kCS,cRLS -sigalg SHA256withRSA -storepass:env PASSWORD_ENV -storetype
pkcs12 -startdate -10000M -dname 'CN=Engine <domain> CA, C=US' -keypass:env
PASSWORD_ENV -storetype pkcs12 -keystore keystore
```

### 2. Generate the HTTPS/TLS certificate

```
PASSWORD_ENV='changeit' keytool -genkeypair -alias tomcat -keyalg RSA -keysize
2048 -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:fa
lse -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV
```

```
-startdate -10080M -dname 'CN=<domain>, C=US' -keypass:env PASSWORD_ENV
-keystore keystoreGenerate the DSP certificate
```

### 3. Generate the DSP Certificate

```
PASSWORD_ENV='changeit' keytool -genkeypair -alias dsp -keyalg RSA -keysize
2048 -validity 397 -ext 1.3.6.1.5.5.7.3.1 -ext san=dns:<domain> -ext bc=ca:fales
e -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV
-startdate -10080M -dname 'CN=<domain>, C=US' -keypass:env PASSWORD_ENV
-keystore keystore
```

### 4. Sign the HTTPS/TLS certificate

```
PASSWORD_ENV='changeit' keytool -certreq -alias tomcat -keyalg RSA -sigalg
SHA256withRSA -storetype pkcs12 -keypass:env PASSWORD_ENV -storepass:env
PASSWORD_ENV -keystore keystore | PASSWORD_ENV='changeit' keytool -gencert
-alias delphixca -ext 'san=dns:' -validity 397 -sigalg SHA256withRSA -storetype
pkcs12 -storepass:env PASSWORD_ENV -keystore keystore -startdate -10080M |
PASSWORD_ENV='changeit' keytool -importcert -alias tomcat -storetype pkcs12
-storepass:env PASSWORD_ENV -keystore keystore
```

### 5. Sign the DSP Certificate

```
PASSWORD_ENV='changeit' keytool -certreq -alias dsp -keyalg RSA -sigalg SHA256withRSA
-storetype pkcs12 -keypass:env PASSWORD_ENV -storepass:env PASSWORD_ENV -keystore
keystore | PASSWORD_ENV='changeit' keytool -gencert -alias delphixca -ext 'san=dns:'
-validity 397 -sigalg SHA256withRSA -storetype pkcs12 -storepass:env PASSWORD_ENV
-keystore keystore -startdate -10080M | PASSWORD_ENV='changeit' keytool -importcert
-alias dsp -storetype pkcs12 -storepass:env PASSWORD_ENV -keystore keystore
```

At this point, the certificates can be installed by following the Customer Provided Key Pair method described in the [Customer Provided Key Pair Configuration](#) article.

The same keystore generated will be uploaded twice, once using alias 'dsp' and once using alias 'tomcat', to replace DSP and HTTPS certificates, respectively.

 If this error occurs, **Failed to read file with error "Invalid keystore format"**, ensure the **Upload certificate from a PKCS#12 keystore** radio button is selected.

#### Windows keytool distinctions

- Given the Delphix Connector installation directory **C:\Program Files\Delphix\DelphixConnector**, the keytool.exe executable can be found at **C:\ProgramFiles\Delphix\DelphixConnector\jre\bin\keytool.exe**.
- Powershell set environment variable with: `$ENV:PASSWORD_ENV='changeit'`
- Similar to the comment above with path assumption, on Windows, change `./keytool` to `.\keytool.exe` if located in the `jre\bin` subdirectory.

## Configuring network settings

This topic explains how to replace the HTTPS (HTTP Secure) certificate and the DSP (Delphix Session Protocol) certificate used by the Continuous Data Engine. The KeyStore tab in the Network Security panel displays the keys that the Delphix Engine uses for its identity in HTTPS and DSP communication. For a selected service, the tab will show the full certificate chain starting from the end-entity certificate and ending with the root CA.

**Network Security**

**Perform Client (target engine or host) authorization for network test remote connections**  
Disabled

There are two methods of replacing a certificate. The key difference between the two is whether Delphix or the user is providing the key pair (public and private key).

For more information on how to configure these see:

- [Delphix provided key pair configuration](#)
- [User-provided key pair configuration](#)

## Customer provided key pair configuration

This section describes the steps to take if you are replacing the HTTPS or DSP (Delphix Session Protocol) with your own key pair and certificate. To start, you need to add the key pair and full certificate chain as an entry in a file in JKS or PKCS #12 format.

- If replacing the key pair for the DSP application, note that when the DSP Server or Client authenticates each incoming DSP connection (if enabled), it will validate that each certificate of the incoming connection's identity chain has a "Valid From (or Not Before)" date that is after its own time.

Thus, if your Delphix Engine or host environments are running off of an incorrect (slow) time configuration, then your DSP connections will not work until the offending engine or host's time advances past all incoming certificate's "Valid From (or Not Before)" time.

If correcting the Delphix Engine's or host environment's time configuration may cause issues, then you can work around this issue by creating and using a certificate with a "Valid From (or Not Before)" date which is before your slowest Engine or host.

1. From the **Network Security** panel select the **Actions (...)** menu and select **Replace Certificate**.

2. In the **Replace Certificate** window, select **Upload certificate as files**.

- a. The **Certificate Alias** field is where the key pair and certificate is saved in your JKS or PKCS #12 store.
  - b. The **Keystore Passcode** field is the keystore's password.
  - c. The **Key Pair Passcode** field is the password for the given alias' key. If not set, it uses the keystore's password.
3. Click **Next** to view a summary. Then click **Submit**.

Delphix provided key pair configuration

Creating CSR

Use the following instructions to provide an HTTPS or DSP (Delphix Session Protocol) certificate chain for a key pair created by the Delphix Engine.

1. Connect to the Delphix Engine `HTTP://< your engine>/login/index/html#serverSetup`.
2. From the **Network Security** panel select the **Actions (...)** menu and select **Create CSR**.
3. In the **Create CSR window** provide options for your CSR (certificate signing request). Fill up the following fields:
  - a. The **Common Name (CN)** is required. If the CN is a valid hostname, then the **Subject Alternative Name (SAN)** can be left blank, otherwise a SAN should be provided. When the CN is a wildcard Common Name (e.g. \*.abc.com), the SAN must be populated with every possible domain name covered by the certificate as a comma delimited list. A valid SAN is required for most browsers to accept the certificate.

Create CSR
✕

---

Complete the following form and click "Create". A key pair and the CSR will be generated.  
Once created, it can be accessed via the CLI.

**Service**

HTTPS

DSP

**Distinguished Name**

Complete form fields

Create a composite Distinguished Name

Common Name

Subject Alternative Names

Organizational Unit

Organization

Cancel Create

- b. Select the service you want to create a CSR for (HTTPS or DSP)
  - c. Select how to enter the distinguished name (using the provided fields, or as a composite string).
4. The Validate button will verify that your provided distinguished name follows a legal format.

## Create CSR

Complete the following form and click "Create". A key pair and the CSR will be generated.

Once created, it can be accessed via the CLI.

**Service**

- HTTPS  
 DSP

**Distinguished Name**

- Complete form fields  
 Create a composite Distinguished Name

**Composite Distinguished Name**

Validate

Show advanced

Cancel

Create

5. [Optional] select the **Show advanced link** to provide extra options.
  - a. **Force Replace:** By default, this is false and means Delphix will not replace the active key pair and certificate with the newly generated key pair and self-signed certificate. If you want to replace the active key pair right away before the signed certificate has been created this can be set to true.
  - b. **Keypair Algorithm:** Choose whether the created keypair will use the RSA or ECDSA algorithm. Once an algorithm has been chosen the user can customize the key size and the signature algorithm used.
    - i. **Key size:** The valid sizes for RSA are between 2048 and 4096 inclusive. The valid sizes for ECDSA are between 256 and 571 inclusive.
    - ii. **Signature algorithm:** The available signature algorithms for RSA are "SHA256withRSA", "SHA384withRSA", "SHA512withRSA". The available signature algorithms for ECDSA are "SHA256withECDSA", "SHA384withECDSA", "SHA512withECDSA".
6. Click **Create**. Once submitted, the CSR is created, and will show up in the **Open CSR**stab. You can select the CSR and click on View PEM to obtain the CSR in a PEM format.

**Note:**

If creating a CSR for the DSP application, note that when the DSP Server or Client authenticates each incoming DSP connection (if enabled), it will validate that each certificate of the incoming connection's identity chain has a "Valid From (or Not Before)" date that is after its own time.

Thus, if your Delphix Engine or host environments are running off of an incorrect (slow) time configuration, then your DSP connections will not work until the offending engine or host's time advances past all incoming certificate's "Valid From (or Not Before)" time.

If correcting the Delphix Engine's or host environment's time configuration may cause issues, then you can work around this issue by signing the CSR with a "Valid From (or Not Before)" date which is before your slowest Engine or host.

### Replacing a certificate

After the CSR has been signed and turned into an X.509 Certificate, you can replace the certificate using the Replace Certificate option

1. From the **Network Security** panel select the **Actions (...)** menu and select **Replace Certificate**.
2. In the Replace Certificate window, select PEM file contents. You can then paste the PEM response in the text box.

 The PEM contents must contain a list of the entire trust chain from the newly generated end-entity certificate to the root CA. You can do this by just pasting each certificate back to back in the text box as long as they are separated by the begin and end cert tags. The order that the PEM certificates are added to the list does not matter

3. Click **Next**.

4. The **Summary** tab provides a description of your selections. Click **Submit**.

## Host DSP configuration

In Delphix Engine to remote host DSP (Delphix Session Protocol) communication, the Server is the engine and the Client is the host. The Add Environment wizard allows you to tell the Delphix Engine how the KeyStores and TrustStores have been set up on the remote hosts.

- = When the Server or Client authenticates each incoming DSP connection (if enabled), it will validate that each certificate of the incoming connection's identity chain has a "Valid From (or Not Before)" date that is after its own time.

Thus, if your Delphix Engine or host environments are running off of an incorrect (slow) time configuration, then your DSP connections will not work until the offending engine or host's time advances past all incoming certificate's "Valid From (or Not Before)" time.

If correcting the Delphix Engine's or host environment's time configuration may cause issues, then you can workaround this issue by creating and using certificates with a "Valid From (or Not Before)" date which is before your slowest Engine or host.

## Adding a new single instance environment after DSP configuration changes

- If server authentication for remote host communication or engine to host throughput tests is desired, make sure the appropriate config is set. For more details refer to [Configuring Network Security Settings](#). You will need to create a JKS or PKCS#12 keystore on the remote host with the full CA chain of the DSP key in the keystore. By default, the key will just be signed by the Delphix CA, but you can replace the DSP key if you wish. Refer to [KeyStore Settings](#) for more details.
- If client authentication for remote host communication or engine to host throughput tests is also desired, make sure the appropriate config is set. For more details refer to [Configuring Network Security Settings](#). You will need to create another JKS or PKCS#12 keystore on the remote host with the desired key pair. Make sure the created keystore has permissions such that it is readable by all environment users. Then, add the full CA chain of the remote host's key pair to the TrustStore on the engine. For more details, refer to [TrustStore Settings](#)

Once the appropriate toggles are enabled, and the remote host is all set up, you can now add the environment as shown below. If only server authentication was desired, only the TrustStore fields need to be filled in. If client authentication was also desired, then the KeyStore fields will also need to be filled in

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Actions (...)** menu next to Environments and select **Add Environment**.
5. In the **Host and Server** tab, select **Unix/Linux**.
6. Select **Standalone Host** or **Oracle Cluster**, depending on the type of environment you are adding.
7. Click **Next**.
8. In the Environment Settings tab enter your DSP configurations.
9. Select **Submit**.

## Modifying an existing single instance environment after DSP configuration changes

1. If an environment already exists after enabling server/client DSP authentication, you will need to modify its attributes for host communication to continue working. As detailed in the above section [Adding a new single instance environment after DSP configuration changes](#), you will need to set up the appropriate stores on the remote host.
2. Once this is done, the **Details** page of your environment will show the existing DSP attributes.
3. Click the **pencil** icon in the top right corner to edit the DSP KeyStore and TrustStore fields accordingly.

4. Edit the DSP fields as required.
5. Once you are done select the checkmark.

 This will need to be done for all existing environments after DSP server/client authentication is enabled otherwise many host communication features will not work.

#### Adding a new Unix/Linux cluster environment after DSP configuration changes

Adding a new cluster environment is similar to adding a single instance environment, see [Adding a new single instance environment after DSP configuration changes](#). The steps for setting up the TrustStore and/or KeyStore will need to be done on ALL nodes of the cluster. For a new cluster, each node must also be set up to have the exact same path, password, an alias, because the Delphix Engine will use the same configuration for every auto discovered node. If desired, the path, password, and alias configuration can be changed for each node, but only AFTER the cluster has been added. See [Modifying an existing Unix/Linux cluster environment after DSP configuration changes](#) for more details.

#### Modifying an existing Unix/Linux cluster environment after DSP configuration changes

Similar to single instance environments, an existing cluster can be modified if DSP server/client authentication is enabled. In the cluster environment's Details page, each node can be selected and modified individually. You can also use this to change the path, password, and/or alias to be different across nodes for a cluster that was just added.

#### DSP for windows clusters

 This will need to be done for all existing environments after DSP server/client authentication is enabled otherwise many host communication features will not work.

Before adding a Windows cluster, each node must have already been added as a single instance. See [Adding a new single instance environment after DSP configuration changes](#) if adding a new Windows cluster. If modifying a Windows cluster after a DSP configuration change, you can modify each Windows node on its environment details page See [Modifying an existing single instance](#) for more details, or just use the cluster environment details which will allow you to select which node to modify. See [Modifying an existing Unix/Linux cluster environment after DSP configuration changes](#).

## KeyStore settings

The KeyStore tab in the Network Security panel displays the public key certificates that the Delphix Engine uses for its identity in HTTPS and DSP (Delphix Session Protocol) communication. For a selected service, the tab will show the full certificate chain starting from the end-entity certificate and ending with the root CA.

There are two methods of replacing a certificate. The key difference between the two is whether Delphix or the user is providing the key pair (public and private key). For more information see [Configuring Network Settings](#)

Delphix Engine generates alerts when certificates in the Keystore or truststore are expired or about to expire:

- A warning level alert is generated if certificates are expiring in 60 days.
- Critical level alerts are generated if certificates expire in 14 days or have already expired.

## TrustStore settings

The TrustStore tab in the Network Security panel displays all the CA certificates that the Delphix Engine trusts. Click on the Actions (...) menu in the top right to reveal the options for editing the TrustStore contents:

**Delphix Engine generates alerts when certificates in the Keystore or truststore are expired or about to expire:**

- A warning level alert is generated if certificates are expiring in 60 days.
- Critical level alerts are generated if certificates expire in 14 days or have already expired.

### Adding a certificate

1. From the Actions menu select Add Certificate.
2. In the Add Certificate wizard paste the PEM contents of the CA certificate you want to add. The PEM contents must have the appropriate header and footer included.

3. If you are adding a non-root CA certificate, its signer must already exist in the truststore. So, if you are adding a chain with multiple certificates, you must add them individually starting from the root CA. If not, you will get an error saying that we could not establish a chain of trust.

4. Click **Next** to view a Summary tab where you can confirm the certificate contents.

Add Certificate
✕

---

Cancel Back Next Submit

5. Click **Submit**.

### Deleting a certificate

Use this option to delete the selected CA certificate.

**⚠** Deleting any certificate that breaks an existing chain of trust is not allowed.

1. From the Actions menu select **Delete Certificate**.
2. The default Delphix CA cannot be deleted. Note that deleting any certificate that breaks an existing chain of trust is also not allowed.
3. In the Confirmation dialog select **Delete**.

**Delete Certificate**
✕

---

Are you sure you want to delete certificate CN=Engine js532.dcenter.delphix.com CA, C=US?

---

Cancel Delete

**⚠** Unlike the network security settings, any changes to the TrustStore will not require a stack restart.

## Replication security

### Choose encrypt and compress when replicating

Delphix provides encryption capabilities when replicating data from one Delphix Engine to another.

Upon selecting the **Encrypted** option under **Traffic Options** the Delphix Engine intelligently compresses before encrypting data. This ordering leads to lower CPU utilization and higher throughput compared to using encryption alone, with the same level of protection. See [Configuring Replication](#) for details. The flag can be set at any time. Once set, it results in sending subsequent replication traffic streams as encrypted.

Train your Delphix Administrators to choose both options.

## Object security

This section covers the following topics:

- [User management](#)
- [Source database security](#)
- [Source and target host security](#)

## User management

### Secure user management

Secure user management is best achieved by integration with your centralized authentication service. Once the integration is complete, create LDAP authenticated named users to facilitate separation of duties, least privileges, and auditing. Disable the out-of-the-box generic ADMIN and SYSADMIN accounts.

### Use LDAP for authentication

As described under System Configuration above, enable LDAP authentication to leverage your enterprise authentication service and enable SSL/TLS to secure LDAP connections.

### Create named users

Do not create generic functional accounts such as “QA,” “DEV,” or “TEST.” Such accounts will not leave a proper audit trail and violate the separation of duties principle. Instead, create LDAP authenticated named users.

### Assign least privileges

Restrict the **admin** and **sysadmin** roles to 1-2 trusted named users each. These roles are highly privileged and must be carefully managed. These roles typically map to a **DBA** and **System Administrator** respectively.

For subordinate users who need to refresh VDBs, assign “Data Operator” privilege on the VDB and “Reader” privilege on the dSource.

For subordinate users who need to provision new VDBs from dSources, assign “Provisioner” privilege on the dSource and “Provisioner” privilege on the Group to which they will assign the VDB.

### Consider Delphix self-service functionality

The Delphix Self-Service functionality is targeted towards developer and tester self-service, and it contains a more sophisticated privilege model. With this functionality, Delphix Self-Service users do not have access to the Administrator GUI.

Administrators can define multiple data sources as a complete template. They also allocate server resources as a “data container.” The end-user has the ability to update data from the source, from peers using the same source, and from prior images of the source that they have created.

### Disable ADMIN and SYSADMIN

Once you have established named Delphix Administrators and Systems Administrators, disable the out-of-the-box `sysadmin` and `admin` accounts. You can disable accounts through the CLI.

When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling delphix\_admin.

## Source database security

### Choose minimum privileges for Delphix DB user

The Delphix Engine requires a DB user (**delphix\_db**) on your source databases. This account is necessary to detect the state of the source and stay in sync. Do not give unnecessary privileges to this user. Leverage the script provided by Delphix in the hostchecker bundle to create a user with the minimum required privileges. The DB user (e.g., **delphix\_db**, which is the example used on this page) account can have the same or different user name on each of your source databases.

### Protect the Delphix DB user password

Because the **delphix\_db** user has access to sensitive data dictionary information, take steps to protect access to this account.

### Use database encryption functionality to encrypt sensitive data at rest

Database vendors provide tools to encrypt data at rest. This encrypts data on disk in order to provide protection at rest. Use the database encryption on your source databases to encrypt sensitive or all data. Delphix integrates seamlessly with database encryption to provide protection at rest.

### Choose encrypt and compress when linking

Delphix provides encryption capabilities when linking against your source databases. Encrypting while linking can lead to higher CPU utilization and higher throughput. This overhead can be reduced by selecting both the Compress and Encrypt options, in order to compress the data before it is encrypted. Train your Delphix Administrators to choose both options.

## Source and target host security

### Oracle on UNIX

Delphix support for Oracle on UNIX requires an OS account (**delphix\_os**) on source database servers and on target servers that will host virtual databases or files. The Delphix Engine uses SSH to send commands to this user, which performs operations on the host. Some of these commands require elevated privileges.

There is no actual requirement that the account be named **delphix\_os** on both sources and targets. You can name the account anything you want; you can also use separate accounts on every source and target.

- **Restrict su - delphix\_os to named Delphix admins and system administrators**

Other users of the system do not need access to the delphix\_os user. Your Delphix Admins and System Administrators should retain su ability to facilitate troubleshooting.

- **Use SSH Key exchange to allow the Delphix engine to communicate with targets**

Implement public/private key exchange instead of username/password. This allows you to keep the password of **delphix\_os** completely secret.

- **Put delphix\_os on password rotation** Rotate the delphix\_os password in accordance with your enterprise security policy for application software accounts. You should either:
  - implement SSH Key exchange prior to placing delphix\_os on password rotation, or
  - script CLI commands to update the password inside the engine as part of the rotation process.

Delphix Professional Services can assist you in integrating Delphix with your enterprise password rotation system.

- **Restrict elevated privilege commands to the lowest level needed** The Delphix Engine uses elevated privileges to provide core features as well as optional features. The Delphix docs describe in detail which privileges are absolutely necessary, as well as techniques for further restricting the commands that can be used. The Delphix Engine ships with support for “sudo” as the privilege elevation system, but also allows for integration with third-party and custom centralized privilege management systems.

### Windows

Delphix support for SQL Server requires two OS accounts for Windows:

- **delphix\_src** – used on the source database server
- **delphix\_trgt** – used on the servers which host Virtual Databases Both are required for the Validated Sync target

There is no actual requirement that the account is named **delphix\_src/delphix\_trgt**. You can name the account anything you want; you can also use separate accounts on every source and target. Finally, you can create a single account for use everywhere, but this is not recommended since it violates the separation of duties.

### Restrict privileged commands to the lowest level needed

The Delphix user or domain account should have exactly the privileges required in the Delphix documentation. Do not grant additional privileges.

Put delphix\_src and delphix\_trgt on password rotation

Change the user or domain account password at regular intervals or in accordance with security policies for application software accounts. Use CLI scripts to quickly modify the password across the Delphix ecosystem. Delphix Professional Services can assist you in scripting and integrating Delphix with your enterprise password rotation system.

Use minimum privileges on your SMB share

Consult <http://technet.microsoft.com/en-us/library/cc754178.aspx> to understand how shared folder privileges work. Use the minimum privileges.

Use windows authentication for SQL server

SQL Server allows authentication via Windows or Mixed mode. Mixed mode allows authentication via Windows or SQL Server.

Windows authentication is more secure; it uses Kerberos security protocol, provides password policy enforcement with regard to complexity validation for strong passwords, provides support for account lockout, and supports password expiration. <http://msdn.microsoft.com/en-us/library/ms144284.aspx>

## System configuration

There are a number of configuration options available in the System Administration area that help you to secure the Delphix Engine. You can configure these during installation through the setup wizard, or later by accessing the Delphix Setup screens.

### Maintain system time with NTP

Establish at least one, but preferably three, corporate NTP servers and sync your Delphix Engine to them. This ensures that audit and error messages display the correct time.

When configuring Delphix Engine on VMware, be sure to configure the NTP client on the ESX host to use the same servers that you enter here. On a vSphere client, the NTP client is set in the **Security Profile** section of the configuration process.

### Enable phone home

Phone Home service will send critical information about the Delphix Engine to Delphix Support using HTTPS, on a periodic basis. The use of a Web Proxy Server is fully supported. Phone Home data allows Delphix Support to proactively detect Delphix Engines affected by critical vulnerabilities.

### Register your Delphix engine

Registration is fast and easy, and you can do it with or without Internet connectivity from the Delphix Engine. Failing to register the Delphix Engine will impact its supportability and security in future versions.

### Enable LDAP for authentication

The LDAP protocol is used by enterprise authentication services. Enabling LDAP authentication allows your Delphix Engine to leverage the password control features of these products, such as expiration, lockout, and complexity.

Import your LDAP server certificate into your Delphix Engine, and enable SSL/TLS.

### Enable SMTP and/or SNMP monitoring

When the Delphix Engine encounters errors, it issues **alerts**. Configure SMTP and/or SNMP to forward **alerts** to your central monitoring system.

## GUI security

### Overview

The sections in this article cover securing the Delphix GUI, which is similar to securing other web consoles. Some of these solutions include reducing the session timeout threshold, creating a signed certificate, and disabling HTTP access.

### Reduce inactive session timeout to 15 minutes

This means that a user will be booted from the session after 15 minutes of inactivity. This is done with a CLI command on a per-user basis by modifying the `sessionTimeout` property of the **User** object, as shown below. The default inactive timeout happens after 30 minutes.

```
myhost.delphix.com> cd user
myhost.delphix.com user> select delphix_admin
myhost.delphix.com user 'delphix_admin'> update
myhost.delphix.com user 'delphix_admin' update *> set sessionTimeout=15
myhost.delphix.com user 'delphix_admin' update *> commit
```

### Use a URL from your domain and create a signed certificate

Do not use IP Addresses to access the Delphix Engine. Create a hostname and DNS entry, such as “delphix1.mycompany.com”. Delphix Support can assist in converting the engine from a self-signed certificate to a signed certificate that maps to your domain name. Please file a Support ticket to proceed.

### Disable HTTP access

Disabling HTTP or configuring HTTP to redirect connections to HTTPS is recommended to protect in-flight user credentials and connections with the engine. This can be done via the [command line](#) or through the [GUI](#).

## Masking sensitive data

Encryption does not protect data that is accessed through applications and database clients, the most likely attack vector. Masking sensitive data before it gets to non-production systems is a critical tool in the security arsenal.

Delphix provides an add-on masking product for simple cost-effective integration. It is also possible to integrate Delphix with any masking technology.

There are many topologies to consider, and the complete explanation of their pros and cons is outside the scope of this document. Delphix Professional Services can assist you in analyzing various masking solutions.

## Audit logs

### Review audit logs monthly

Conduct a monthly review of audit logs on your Delphix Engine. Pay particular attention to provisioning operations of unmasked databases, which creates new copies of your production data. See [Accessing Audit Logs](#) for instructions.

### Forward audit logs to central server via syslog

Forward audit logs to a central audit server using syslog techniques. Delphix Professional Services can assist you with scripts that facilitate this. See also [Setting Syslog Preferences](#) for configuration instructions.

## Support security

At least every six months, regenerate the registration code and re-register the engine. See [Regenerating the Delphix engine registration code](#) for instructions and the reasons why this is important for security.

## Delphix operating system (DxOS)

Delphix Support accesses the DxOS for deep diagnostics and troubleshooting. Access to the Delphix Engine requires access to your network. Typically this is granted via shared troubleshooting sessions over Webex, with full transparency.

If desired, you can enable additional control so that access can only take place when you provide a token.

If you disable Support Access, do not have the token, and you are unable to login as a system administrator, it can become impossible for Delphix Support to login to repair your system. Example: the management stack crashes, the login system becomes unavailable, and you have disabled Support Access and do not have the token. For this reason, Delphix strongly recommends leaving Support Access enabled at all times. If you wish to disable access, generate a unique token once a month and place it in a secure location separate from the Delphix Engine.

## Disable support access (optional)

Support Access Control is managed as a system administrator in the Server Setup area.

- When set to DISABLED, it is impossible for Delphix Support to login to the DxOS.
- When set to ENABLED (the default), Delphix Support can login to the DxOS.
- When set to ENABLED and calendar time is set and a token generated, Delphix Support can only login with the token during that timeframe, which you provide. Generate the token once/month for an entire month and store it in a secure location separate from your Delphix Engine. When requested, provide the token through a secure means: in your support ticket, via email or SMS to a trusted entity, etc.

## Password policies

### Getting started

The password policy feature allows users to create their own custom password policies and enforce the password policy on non-LDAP Delphix Engine users.

### Understanding password policies

A password policy is a named password policy that can be assigned to a user. It is a set of requirements that passwords must satisfy.

- `minLength` - A password must be longer than this length.
- `reuseDisallowLimit` - The user should not reuse old passwords. This tells the number of last used passwords disallowed to be reused as the new passwords.
- `uppercaseLetter` - A password must have at least one capital letter.
- `lowercaseLetter` - A password must have at least one lower case letter.
- `digit` - A password must have at least one digit.
- `symbol` - A password must have at least one symbol.
- `disallowUsernameAsPassword` - A password should not be the same as the user name.

#### Password policy requirements

When you set a password, it must differ from the most recent password and contain:

- at least 5 characters
- at least one uppercase letter
- at least one lowercase letter
- at least one numeric digit
- at least one symbol such as #, \$, !
- do not use username or reverse username

This policy applies to non-LDAP Delphix Engine users. This includes the default users, **delphix\_admin** and **sysadmin**. The password policy does not apply to LDAP users.

### Default password policy

By default, the Delphix Engine enforces the password policy named **NONE**, which enforces the least possible constraint.

Passwords must contain at least one character.

### Changing the password policy

To change the current password policy from the default policy **NONE**, create a custom password policy and select it instead of **NONE**.

#### Who can change password policy for whom

- Domain administrators can change the current password policy for all domain users.
- System users can change the current password policy for all system users.
- Domain regular users (non-administrators) users can only view the password policy.

## What operations can be done by administrators

- Create custom password policies
- Update custom password policies
- Delete custom password policies
- Change the current password policy to any of the available password policies
- View available password policies
- View current password policy requirements

## Password policy parameters

When you create a password policy, you can set the following parameters:

- Unique name for the password policy
- Minimum length of the password
- Whether password must differ from the last password
- Whether password must not contain the username or reverse user name
- Whether password must contain at least one uppercase letter
- Whether password must contain at least one lowercase letter
- Whether password must contain at least one numeric digit
- Whether password must contain at least one symbol such as #, \$, !

## Restrictions

- Restrictions for default password policy's modification (named **NONE**):
  - not allowed to delete the default password policy from available list of password policies.
  - not allowed to update any parameters of the default password policy.
- Cannot delete the password policy which is set as current password policy.

## Additional topics

The Delphix Engine provides robust, enterprise-quality security controls. Performing the steps listed in this document will allow you to easily bring your Delphix Engines into compliance with your organization's security policies.

### Perform a yearly audit

At least once annually, audit one or more Delphix Engines to ensure compliance with your security policies.

### Port scan

Delphix fully supports network security scans, using a tool of your choosing.

### Security testing

Many companies require security testing of applications in their environment using a Port Scanner or other Security Penetration Test tools. Delphix supports the use of these security tools with the application credentials available for the engine (e.g., delphix\_admin). The Delphix Engine is a closed appliance, and OS credentials on the appliance are not provided for these tests.

### Security banner

You can configure a custom security banner that will be displayed to all the users prior to login.

1. Login to the CLI using the sysadmin **username** and **password**.

```
ssh sysadmin@yourdelphixengine
```

2. Set the configuration and commit the changes.

```
delphix > service security
delphix service security > update
delphix service security update * > set banner="Your Message Here"
delphix service security update * > commit
```

The string set in the banner is in plain text only. You can also generate banners with multiple lines, however, this can only be done using the "securityConfig" API. Refer to the [Delphix KB article](#) for additional information.

### Virtual database security

The Delphix Engine provides advanced storage capabilities and automation to allow rapid provisioning of virtual databases (VDBs), which use only a fraction of the physical storage used by full database copies. Nonetheless, a VDB is equivalent to a physical database **and must be properly secured like any other database**.

By far the most dangerous attack vectors in the Delphix ecosystem are the same ones that existed pre-Delphix: unauthorized access to your non-production systems containing sensitive production data. **You must perform all the same actions to harden virtual databases as you would to harden physical clones.**

For information on securing your virtual databases, consult vendor-specific material and security guides.

# Datasets

## Datasets

A key part of using Delphix is how we integrate with various data sources. In the Getting Started section, you can find information related to general dataset usage, that is, that usage that is not specific to any data platform. This encompasses topics such as adding environments, creating their users, and using Delphix objects such as virtual databases (VDBs). Separately, there are also data platform-specific features that are only applicable to a certain database. If you need to learn more about the requirements or workflows of a particular data platform, you can find them in the named sections below.

- [Getting started](#)
- [IBM Db2 environments and data sources](#)
- [MySQL environments and data sources](#)
- [Oracle environments and data sources](#)
- [Oracle E-Business Suite \(EBS\) environments and data sources](#)
- [PostgreSQL environments and data sources](#)
- [SAP ASE environments and data sources](#)
- [SQL Server environments and data sources](#)
- [SAP HANA environments and data sources](#)
- [Unstructured files and app data](#)

## Getting started

In order to start using Delphix, you'll need to connect one or more data sources and appropriate hosts for an engine. These are key concepts you'll need to understand as an administrator using Delphix with any data source. An outline of the contents in this section:

This section covers the following topics:

- [Managing environments and hosts](#)
- [Managing data sources and syncing data](#)
- [Provisioning and managing virtual databases](#)
- [Hook scripts for automation and customization](#)
- [Managing policies](#)
- [Accessing the Delphix engine](#)

## Managing environments and hosts

In Delphix, an environment is either a single instance host or cluster of hosts that run database software. For example, a Linux system running Postgres. This may either be an individual instance, or a cluster like Oracle RAC. Environments can either be a source (where data comes from), staging (where data are prepared/masked) or target (where data are delivered and used by developers and testers).

Each environment has its own properties and information depending on the type of environment it is. In this section, you can learn about how to add environments to Delphix as well as what attributes and configurations that environments have.

### Environment attributes and configurations

This topic describes the attributes of an environment such as name, host address, ssh port, or toolkit path. For more advanced attributes for specific data platforms, please navigate to that data platform's documentation section.

#### Environment attributes

Attribute	Description
Environment user(s)	The user(s) for the environment. These are the users who have permission to ssh into an environment (Unix-based environments) or access the environment through the Delphix Connector (Windows-based environments).
Host address	The fully qualified domain name or IP address for the environment.
NFS addresses (Unix-based hosts only)	A list of IP addresses to be used for NFS mount for this environment.  If left empty, Delphix will automatically use the Host Address parameter above for NFS requests
Delphix session protocol (DSP) Configurations	If an environment already exists after enabling server/client DSP authentication, you will need to modify its attributes for host communication to continue working, you will need to set up the appropriate stores on the remote host.
SSH port	Environment port used for SSH, usually port 22. This parameter is only used for Unix-based environments.
Toolkit path	Location of the toolkit. For Windows hosts, this will be specified once installing the Delphix Windows Connector.

Attribute	Description
Java path	<p>Location of the Java Development Kit (JDK) used for the host. Only specified if the feature to provide your own JDK is enabled, otherwise, the defaults are used per our Java Support Matrix. (<a href="#">link</a>)</p> <p>Delphix uses Eclipse Adoptium (formerly known as AdoptOpenJDK) by default. You can provide your own Java when adding an environment and in the environment configuration page,</p>
Notes	Any other information you want to add about the environment

## Environment users

Not to be confused with Delphix administrator users and sysadmin users, environment users must be created for each environment to perform actions on each host. These users are configured for each data platform to interface with the database instance on the host.

1. Login to the Delphix Management application using Delphix Admin credentials.
2. Click **Manage**.
3. Select **Environments**.
4. Click on the existing environment name you want to modify and open the environment information screen.
5. In the **Details** tab, click the **Plus** icon located next to Environment users.
6. There are two ways that can be used for the Delphix Engine to login into the environment.
  - a. Enter the Username and Password for the OS user in that environment and click **Validate**.
  - b. If you want to use a **public key** for logging into your environment:
    - i. Select 'Username and Public Key' for the Login Type.
    - ii. Copy the public key that is displayed, and append it to the end of ~/.ssh/authorized\_keys file of the new user being added. If this directory or file does not exist, you will need to create it.
    - iii. Run `chmod 600 authorized_keys` to enable only the file owner with read and write privileges.
    - iv. Run `chmod 755 ~` to make your home directory writable only by your user and no other user may write to it.
    - v. The public key needs to be added only once per user and per environment.
7. Click the **Add** icon to save the new user.
8. To change the primary user for this environment, select the environment. Then click the **'star'** icon next to **Environment Users**. Only the primary user will be used for environment discovery.
9. To delete a user, click the **Trash** icon next to their username.

## Environment operations

Environments managed by Delphix have two operations, refresh and delete.

1. **Environment refresh**: will update the metadata associated with that environment and sends a new toolkit to the host.
2. **Environment delete**: will remove all metadata associated with an environment on the engine.

## Environment refresh

After you make changes to an environment that you have already set up in the Delphix Management application, such as installing a new database home, creating a new database, or adding a new listener, you may need to refresh the environment to reflect these changes.

During environment discovery and environment refreshes, Delphix pushes a new copy of the toolkit to each host environment and will replace the old toolkit with the newer one. Included in the toolkit are:

- A Java Runtime Environment (JRE)
- Delphix jar files
- The HostChecker utility
- Scripts for managing the environment and/or VDBs
- Delphix Connector log files

When you refresh the environment it will push the toolkit back to the directory identified as the "Toolkit Path" for the given environment. Once this completes, you should be able to bring the dSource back online.

Delphix then executes some of these scripts to discover information about the objects in your environment (where the databases are installed, the database names, information required to connect to these databases, etc.). In some environments (Windows in particular), the scripts are customized to fit your environment.

 An environment refresh or discovery operation does not alter the source configuration of manually added databases. If you have added the databases manually, then Delphix does not update its source configuration upon discovering a change.

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. In the Environments panel, click the name of the environment you want to refresh.
5. Select the **Refresh** icon.
6. In the Refresh confirmation dialog select **Refresh**.

## Environment delete

Deleting an environment in Delphix will remove all data and configurations related to that environment. This action only affects the environment metadata stored in the Delphix Engine. It will not affect your database installations or homes on the hosts or clusters that the environment is referencing.

Before you can delete an environment, you must first delete all dependencies such as dSources and virtual databases (VDBs)

1. Login to the **Delphix Management** application.
2. Select **Environments**.
3. In the Environments panel, select the environment you want to delete.
4. Click the Actions (...) menu, and select **Delete**.
5. In the Delete Environment confirmation dialog click **Delete**.

## Using HostChecker to validate environments

HostChecker is a standalone program which validates that host machines are configured correctly before the Delphix Engine uses them as data sources and provision targets.

Please note that HostChecker does not communicate changes made to hosts back to the Delphix Engine. If you reconfigure a host, you must refresh the host in the Delphix Engine in order for it to detect your changes.

You can run the tests contained in the HostChecker individually, or all at once. You must run these tests on both the source and target hosts to verify their configurations. As the tests run, you will either see validation messages that the test has completed successfully, or error messages directing you to make changes to the host configuration.

HostChecker is distributed as a set of Java files and executables. You can find these files and executables in five distinct tarballs, each containing a different jdk corresponding to a particular platform (OS + processor). Together, these tarballs comprise the set of engines supported by Delphix.

When validating hosts during a new deployment, it is important to download the appropriate tarball for the host you are validating. Tarballs follow the naming convention "hostchecker\_<OS>\_<processor>.tar." For example, if you are validating a linux x86 host, you should download the tarball named hostchecker\_linux\_x86.tar.

HostChecker is also included in the Delphix Toolkit which is pushed to every environment managed by the Delphix Engine. It can be found in /<toolkit-path>/<Delphix\_COMMON>/client/hostchecker.

## Privilege elevation profiles

Privilege Elevation Profiles exist to provide the Delphix Engine with a mechanism for running privileged commands in a secure way to achieve the following:

- Mount and Unmount NFS filesystems
- Create and Remove directories in paths not owned by the Delphix OS user
- Examine the running process list
- Run commands as root

This is an advanced CLI topic and intended for advanced end-users and Delphix Professional Services consultants.

### Support for privilege elevation profiles

Writing and troubleshooting scripts, such as those required for Privilege Elevation Profiles, is out of scope and not covered by Delphix Support.

## How do privilege elevation profiles work?

Privilege Elevation Profiles need to be tailor-made to work with non-standard environments that may use third-party or proprietary a privilege elevation mechanism other than sudo. Customers are strongly encouraged to work with Delphix Professional Services to formulate reliable profile scripts.

Privilege Elevation Profiles exist within a two-tier cascading hierarchy. This means there is one default profile for the entire Delphix Engine that should contain scripts for all the operations that require privilege elevation. Additional profiles may contain a subset of the scripts. When a non-default profile is used, the Delphix Engine uses that profile's scripts where they exist and reverts to the scripts in the default profile if no script for the operation exists. By default, the Delphix Engine ships with simple scripts that pass commands to the standard UNIX sudo command.

All Environments added to the Delphix Engine get added with the default Privilege Elevation Profile. The profile can be assigned on a per-host basis. Below shows how a host using a non-standard profile will use scripts in the cascading model.

In order to create a privilege elevation profile, you must create both a profile and a profileScript. Scripts exist for particular operations, which include:

- dlp\_x\_mount
- dlp\_x\_umount
- dlp\_x\_rmdir
- dlp\_x\_mkdir
- dlp\_x\_ps
- dlp\_x\_pexec

There are three parameters when creating a new profile:

1. name:
2. contents:
3. profile:

## The Delphix toolkit

The Delphix Toolkit is a group of files that allow communication between Delphix engines and remote hosts. Included in the Delphix Toolkit are:

- Database and Host Scripts
- Delphix Session Protocol (DSP) binaries
- Delphix HostChecker
- Java Development Kit (JDK)

The Delphix Toolkit is automatically sent to Environments at the specified Toolkit Path whenever adding or refreshing an environment.

### Toolkit size and predicted growth

Delphix Toolkit's size depends on two factors:

1. The number of Delphix client applications running on the environment
2. The number of VDBs on the environment (if any)

There are currently three Delphix client-side applications: SnapSyncClient, the Delphix Connector, and V2P. Each of the clients that run from the client-side toolkit generates their own logs - info, trace, debug, error. Each level of logging is restricted to a maximum of 10 log files and these log files are capped at 10 MB each.

Therefore the maximum space occupied by the toolkit directory on the Source server is its initial size of 400 MB + 1200 MB = 1.6 GB.

However, on the target server, the maximum toolkit size is initial size 400 MB + 800 MB + (Number of VDBs \* 1MB)

## Managing data sources and syncing data

A dSource is a virtualized representation of a physical or logical source database, which cannot be accessed using database tools. In order to use dSource snapshots, you must create a virtual database (VDB), an independent, writable copy of a dSource snapshot.

Once an environment has been added, Delphix will automatically discover any data sources on the host. These appear as dSources on the Databases page of each environment. This section will describe how to manage these dSources and sync data from your sources. The following operations and concepts exist for dSources:

- Link/Sync
- Timeflows
- Snapshots
- SnapSync and LogSync
- Enable/Disable
- Detach/Reattach
- Delete
- Upgrade

### Linking dSources

Once you have discovered your data source environments, you will see a list of data sources on that host. The first step to sync data is to link a dSource from the host.

Linking a dSource will ingest data from the source and create a dSource object on the engine. The dSource is an object that the Delphix Virtualization Engine uses to create and update virtual copies of your database. As a virtualized representation of your source data, it cannot be managed, manipulated, or examined by database tools.

Once a dSource has been linked, you can begin to perform dSource operations on it, such as enable, detach, delete, and more.

### The dSource timeflow

Both dSources and VDBs have Timeflows, which are a collection of snapshots for a particular data set. Virtual databases can be provisioned from any snapshots in a Timeflow. In the UI, a Timeflow is represented vertically with a series of individual snapshots as rows.

### The dSource snapshot

Snapshots of dSources preserve specific points in time for use later during the virtual database provisioning workflow. Taking a snapshot will create a new snapshot entry in the dSource's Timeflow.

### SnapSync and LogSync

This dSource Timeflow described above is maintained through the use of SnapSync and LogSync.

#### **SnapSync**

SnapSync will pull over the complete data set during the initial load using standard database protocols.

Subsequent SnapSync operations will pull only the incremental changes and store them with optimal storage efficiency. At the end of each SnapSync operation, a snapshot is created that serves as the base point for provisioning operations.

When provisioning a VDB, the closer the origin point is to a snapshot created via SnapSync, the sooner the provisioning operation will complete.

### LogSync

In addition to SnapSync, LogSync will periodically connect to the host(s) running the source database via standard protocols and pull over any log files associated with the database. These log files are stored separately from the SnapSync data and are used to provision from points in between SnapSync snapshots.

When provisioning from a point between snapshots, the additional time it takes to provision is directly proportional to the time difference between the provision point and the last snapshot. The rate of change on the source database dictates the amount of data that must be replayed to bring a virtual database to the correct point in time.

### Enabling and disabling dSources

Some operations, such as dSource upgrade, are not available unless the dSource is disabled. Disabling a dSource turns off communication between the Delphix Engine and the source database, but it does not remove the configuration that enables communication and updates data. When a disabled dSource is later enabled, it will resume communication and incremental data updates from the source database according to the original policies and data management configurations that you set.

Disabling a dSource is also a prerequisite for several other operations, such as:

- database migration
- upgrading the dSource metadata after the upgrade of the associated data source
- restoring the source database from a backup

Disabling a dSource will stop further operations on the Delphix Engine related to the dSource.

1. Login to the **Delphix Management** application.
2. Select the dSource you want to disable.
3. In the upper right-hand corner, from the Actions menu (...) select **Disable**.
4. In the Disable dialog, select **Disable**.

When you are ready to **enable** the dSource again, from the Actions menu (...) select **Enable**, and the dSource will continue to function as it did previously.

### Detaching and reattaching dSources

Each dSource contains metadata that associates it with the source database, as well as the data it has ingested from the source database in the form of snapshots up to that point.

You may want to detach a dSource from a data source and reattach it to another source. It is possible to detach, or unlink, a dSource from its source database. This breaks the association with the source database without affecting the data within the Delphix Engine.

Detached dSources and their source databases have these properties:

- A detached dSources can still be used to provision a virtual database (VDB).
- You can re-link the source database as a different dSource.
- Any child VDBs that were provisioned from this dSource will only be able to be refreshed from the most recent snapshot available on the dSource.
- If you need a VDB from a newer snapshot, you will need to provision a new VDB. Once you have provisioned the new VDB you can delete the old VDBs provisioned from this dSource. You can delete the old dSource when it is no longer needed.

Detaching a dSource

1. Login to the **Delphix Management** application.

2. Select the dSource you want to detach.
3. From the Actions menu (...), select **Unlink dSource**.  
A warning message will appear.
4. Click **Unlink** to confirm. The status of the dSource will show as Detached.

When you are ready to **attach** the dSource again, from the Actions menu (...) select **Link dSource**, and the dSource.

### Deleting dSources

Deleting a dSource will delete the dSource metadata for a particular source database, along with all associated snapshots, logs, and policies stored in Delphix. If a dSource is deleted, it will not affect your source database.

### Prerequisites

You cannot delete a dSource that has dependent virtual databases (VDBs). Before deleting a dSource, ensure that you have deleted all dependent VDBs as described in *Deleting a VDB on [Provisioning and Managing Virtual Databases](#)*. Otherwise, the delete option will be grayed out.

-  For dSources, you cannot delete a dSource that has dependent virtual databases (VDBs) or virtual Pluggable databases (vPDBs). Before deleting a dSource, ensure that you have deleted all dependent VDBs or vPDBs. Otherwise, the delete option will be grayed out. When you delete all the dSources of PDBs, the associated CDBs are automatically deleted.

### Procedure

1. Login to the **Delphix Management** application.
2. Select the dSource you want to delete.
3. From the Actions menu (...), select **Delete**.
4. Click **Delete** to confirm.

### Upgrading dSources

Occasionally, you may upgrade the source database that a dSource is associated with. In this case, you will need to update the dSource's metadata to associate a dSource with a more recent database version, thus performing an 'upgrade' of the dSource's known version.

While this feature does not upgrade the actual database, it is important that Delphix associates this dSource with the correct version of the source database to function properly.

This process of upgrading a dSource will modify the database installation path to use the path of the newer database installation.

The process for the upgrade of dSources will vary depending on the database. Refer to the following pages for database-specific procedures:

- [Upgrading dSources after an Oracle Upgrade](#)
- [Upgrading a dSource after a SQL Server Upgrade](#)
- [Upgrading a SAP ASE dSource](#)

### Prerequisites

- The data source instance has been upgraded to a more recent installation version.
- The dSource must be disabled.

## Provisioning and managing virtual databases

After you have added a data source from an environment and created snapshots of a dSource, you can begin to provision virtual databases (VDBs), one of the key parts of using Delphix.

As discussed before, a dSource is a virtualized representation of a physical or logical source database, which cannot be accessed or manipulated using database tools. In order to use dSource snapshots, you must create a VDB, an independent, writable copy of a dSource snapshot.

You can create VDBs from other VDBs. Once a VDB has been provisioned to a target environment, you can also create a snapshot policy for that VDB, to capture changes within it as if it were any other logical or physical database.

The following operations and concepts exist for VDBs:

- [Provision](#)
- [Start/Stop](#)
- [Refresh](#)
- [Rewind \(Rollback\)](#)
- [Enable/Disable](#)
- [Delete](#)
- [Force delete](#)
- [Migrate](#)
- [Upgrade](#)
- [Virtual to physical \(V2P\)](#)
- VDB configuration templates

### Provisioning virtual databases

Virtual databases are a key data management concept for Delphix. In order to create or provision a virtual database, you will need a linked dSource from a source host and a compatible target environment, as described in the overview for [Managing environments and hosts](#). Since provisioning VDBs varies significantly across data platforms, details on this process can be found within the documentation for a specific data platform.

At their core, virtual databases are fully functional copies of data sources that can be created and managed at a fraction of the storage and time that are typically required. To end-users, VDBs act and perform just like a standard database.

### The VDB timeflow

Both dSources and VDBs have timeflows, which are a collection of snapshots for a particular data set. Virtual databases can be provisioned from any snapshots in a Timeflow. The Virtual database's filesystem will be dependent upon the snapshot used to Provision, and as such, that snapshot can not be removed until the dependency is removed. In the product UI, a Timeflow is represented vertically with a series of individual snapshots as rows.

### The VDB snapshot

Snapshots of dSources preserve specific points in time for use later during the virtual database provisioning workflow. Taking a snapshot will create a new snapshot entry in the VDBs Timeflow.

## Refreshing virtual databases

Refreshing a VDB will re-provision it from the dSource. As with the normal provisioning process, you can choose to refresh the VDB from a snapshot or a specific point in time. However, you should be aware that refreshing a VDB will delete any changes that have been made to it over time. When you refresh a VDB, it will revert to its past state in the specified snapshot or point in time.

When performing a VDB refresh, there is an option to choose between either the faster or more accurate point in time for that database.

**i** Although the VDB no longer contains the previous contents, the previous Snapshots and TimeFlow still remain in Delphix and are accessible through the Command Line Interface (CLI).

### Prerequisites

To refresh a VDB, you must have the following permissions:

- **PROVISIONER** permissions on the dSource associated with the VDB
- **PROVISIONER** permissions on the group that contains the VDB
- **Owner** permissions on the VDB itself
- **Data** is a role that allows DB\_ROLLBACK, DB\_REFRESH, READ\_ACTION, DB\_SYNC, JOB\_CANCEL.
- **Read** is a role that allows the user to inspect objects via the READ\_ACTION permission.

A user with admin credentials can perform a VDB Refresh on any VDB in the system.

### Procedure

Perform the following steps to refresh a VDB.

1. Log in to the **Delphix Management** application.
2. Navigate to **Manage > Datasets**.
3. Select the VDB that you want to refresh.
4. Click the **Refresh VDB** button. The Refresh VDB screen appears.

5. Select one of the refresh options and click **Next**.
  - a. **Faster** - This option will utilize the most recent snapshot in the timeflow.
  - b. **More accurate** - This option allows you to select a snapshot, a point in time, or a specific log ID.
6. Click **Submit** to confirm.
7. Click the **Actions** button to watch the progress of the refresh job.
8. If you want to know when the VDB was last refreshed/provisioned, check the Time Point on the **Status** page.

## Rewinding virtual databases

Rewinding a VDB rolls it back to a previous point in its Timeflow and re-provisions the VDB. The VDB will no longer contain changes after the rewind point.

### **i** **Rewind VDB**

Although the VDB no longer contains changes after the rewind point, the rolled-over Snapshots and Timeflow still remain in Delphix and are accessible through the Command Line Interface (CLI). See the topic [CLI Cookbook: Rolling forward a VDB](#) for instructions on how to use these snapshots to refresh a VDB to one of its later states after it has been rewound.

**i** Delphix clones a new Timeflow from the closest Snapshot older than or equal to the rewind point. This creates a dependency between the new Timeflow and the parent Snapshot and Timeflow. The parent Snapshot and Timeflow cannot be deleted because of this dependency. The VDB must first be refreshed before the parent Snapshot and Timeflow can be removed.

### Prerequisites

To rewind a VDB, you must have the following permissions:

- **Auditor** permissions on the dSource associated with the VDB
- **Owner** permissions on the VDB itself

You do NOT need **owner** permissions for the group that contains the VDB. A user with admin credentials can perform a VDB Rewind on any VDB in the system.

### Procedure

1. Log in to the **Delphix Management** application.
2. Select the VDB you want to rewind.
3. Select the **Timeflow** tab.
4. Select the rewind point as a snapshot or a point in time.
5. Click **Rewind**.
6. If you want to use login credentials on the target environment other than those associated with the environment user, click **Provide Privileged Credentials**.
7. Click **Rewind** to confirm.

### **i** **Using Timeflow bookmarks**

You can use TimeFlow bookmarks as the rewind point when using the CLI. Bookmarks can be useful to:

- Mark where to rewind to - before starting a batch job on a VDB for example.
- Provide a semantic point to revert back to in case the chosen rewind point turns out to be incorrect.

For a CLI example using a TimeFlow bookmark, see [CLI Cookbook: Provisioning a VDB from a Timeflow Bookmark](#)

## Undoing a rewind or refresh

An accidental refresh of one or more virtual databases (VDBs) from a source database has removed important data. To correct this situation users can undo VDB refresh or rewind actions.

### Procedure

To undo a refresh or rewind via the Delphix Management application:

1. Login to the **Delphix Management** application.
2. Under **Datasets**, select the **VDB** you want to undo your rewind/refresh for.
3. From the **Actions** menu (...) select **Undo Refresh or Rewind**.

4. Confirm that you want to undo the last refresh or rewind for the selected VDB, by selecting Undo.

From the Action sidebar menu, you will be able to view the undo action.

## Starting and stopping virtual databases

Stopping your virtual databases is necessary if you are performing any actions on the database that require it to be offline. In addition to properly stopping the database, the Delphix stop and start actions also unmount and mount the filesystems that are provided by the Delphix Engine as well as performing any Delphix-specific actions during startup or shutdown.

1. Login to the **Delphix Management** application.
2. Select the VDB you want to manage.
3. To stop an active VDB, click the **stop** icon in the top right-hand corner.  
To start an inactive VDB, click the **start** icon in the top right-hand corner.
4. If stopping or starting the VDB requires particular credentials for the target environment other than those of the default environment user:
  - a. Check Provide Privileged Credentials.
  - b. Enter the username and password.
  - c. Click Validate Credentials.
5. Click Yes to stop or start the VDB.
6. You can view the status of the stopping or starting of the VDB in several ways:  
View the **Active Jobs** on the right of the screen or monitor the progress bar from the VDB Status tab.

## Enabling and disabling virtual databases

Disabling a VDB is a prerequisite for procedures such as VDB migration or upgrade. Disabling a VDB removes all traces of it, including any configuration files, from the target environment to which it was provisioned. However, the VDB itself, as well as the metadata, will still exist on the engine.

When you later enable the VDB again, these configuration files are restored on the target environment.

1. Login to the **Delphix Management** application.
2. Select the VDB you want to disable.
3. From the Actions menu select **Disable**.
4. Click **Disable** to acknowledge the warning.

When you are ready to enable the VDB again, from the Actions menu select **Enable**, and the VDB will continue to function as it did previously.

## Deleting virtual databases

Deleting a VDB will remove it and its Timeflow and snapshots from the Delphix Engine entirely. This operation is non-reversible.

### Prerequisites

You cannot delete a VDB that has dependent VDBs. Before deleting a VDBs, make sure that you have deleted all dependent VDBs. Otherwise, the delete option will be grayed out.

Deleting a VDB is an unrecoverable operation. Proceed only if you want to permanently destroy the unique data that was created in the VDB.

### Procedure

1. Login to the **Delphix Management** application.
2. Select the VDB you want to delete.
3. From the **Actions** menu select Delete.
4. Click **Delete** to confirm.

**i Force Delete**

Deleting a vFiles may fail if it cannot be unmounted successfully from all target environments. You can use the **Force Delete** option to ignore all failures during unmount.

## Using force delete

Deleting unused or outdated objects should be a regular part of Delphix Engine administration. This is especially important to prevent low space errors, which can cause the Delphix Engine to stop. The Delphix Engine holds a maximum of 400 objects.

1. Log into the **Delphix Management** application.
2. Select **Resources > Storage Capacity**.
3. Next to the object you want to delete select the **Trashcan**.
4. In the Delete dialog select Force Delete. Oracle users will have the option to provide additional credentials.

**Delete Dataset Child VDB** ✕

Are you sure you want to delete dataset "Child VDB"?

Force Delete

Provide privileged credentials

Cancel Delete

5. Click Delete.

**Dependencies**

If there are dependencies on the snapshot, you will not be able to delete the snapshot free space; the dependencies rely on the data associated with the snapshot. These items are displayed with a lock icon next to the name.

## Delete Dataset dbdhcp1

✕

---

**Unable to delete dataset dbdhcp1**

**Dataset dbdhcp1 is locked due to the following dependencies:**

- VDB "C3" has been provisioned from it
- VDB "C1" has been provisioned from it

**Dataset C3 is locked due to the following dependencies:**

- VDB "C4" has been provisioned from it
- VDB "C6" has been provisioned from it
- Self Service template "JSDataTemplate(C3)" has a reference to it

**Dataset C4 is locked due to the following dependencies:**

- VDB "C5" has been provisioned from it
- Self Service container "JSContainer(C4)" has a reference to it

**Dataset C1 is locked due to the following dependencies:**

- VDB "C2" has been provisioned from it

### Migrating virtual databases

There may be situations in which you want to migrate a virtual database to a new target environment, for example when upgrading the host on which the VDB resides, or as part of a general data center migration. Using the VDB migrate functionality allows you to change the VDB's location from one target environment to another.

This is easily accomplished by first disabling the database, then using the Migrate VDB feature to select a new target environment.

#### Prerequisites

- You should have already set up a new target environment that is compatible with the VDB that you want to migrate.
- Ensure that the VDB has first been disabled

#### Procedure

1. Login to the **Delphix Management** application.
2. Select the VDB you want to migrate.
3. From the Actions menu select **Migrate**.
4. Select the new target environment for the VDB, the user for that environment, and the database installation where the VDB will reside.
5. Select **Migrate** to confirm your selections.
6. From the **Actions** menu select **Enable**.
7. Click **Enable** to confirm.

Within a few minutes, your VDB will re-start in the new environment, and you can continue to work with it as you would any other VDB.

## Upgrading virtual databases

Similar to upgrading a data source, upgrading a VDB changes the installation path that is associated with that data platform. While this feature does not upgrade the actual VDB, it is important that Delphix associates this VDB with the correct database version to function properly.

By performing this upgrade, you can update the version of the database installation used for running the VDB.

### Procedure

1. Login to the **Delphix Management** application.
2. Select the VDB you want to upgrade.
3. From the **Actions** menu select **Upgrade**.

## Virtual to physical (V2P)

Virtual to Physical, or V2P, is the process of exporting a virtual database to a physical one.

After you have created a dSource or a VDB, you can export its contents and log files to a physical database. This process creates a set of directories on the target environment and populates them with the database data, log files, and scripts that are used to recover the physical database.

You can automatically start the physical database recovery process as part of V2P, or you can use the scripts for manual recovery. When the export process completes, the target environment will contain a copy of the database in its unvirtualized size, so before you begin the process, make sure the target directories you specify during V2P have enough capacity to hold the database. For more information, visit the following page: [Virtual to physical](#)

### Procedure

1. Login to the **Delphix Management** application.
2. Select the dSource or VDB you want to export.
3. Select the snapshot of the dSource or VDB state you want to export.
4. From the **Actions** menu select **Virtual to Physical**.
5. Select the target environment, and fill the other input fields depending on the data platform of your object.

## Provisioning with replication

This topic describes how to provision from a replicated dSource or virtual database (VDB).

The process for provisioning from replicated objects is the same as the typical VDB provisioning process, except that first you need to select the replica namespace containing the replicated object.

### Prerequisites

- You must have a dSource or VDB that has been replicated from one Delphix Engine to another, as described in [Replication overview](#)
- The Delphix Engine containing the replicated dSource or VDB must have a compatible target environment that it can use to provision a VDB from the replicated dSource or VDB.
- On the Delphix Engine containing the replicated dSource or VDB, login to the Delphix Management application.

### Procedure

1. From the list of replica namespaces, select the replica namespace that contains the dSource or VDB from which you want to provision.
2. The provisioning process is now identical to the process for provisioning standard objects.

## Virtual to physical

## Customizing target directory structure for database export

This topic describes how to customize the target directory layout for database export.

In the V2P export process, it may be necessary to customize the target directory structure which the files will be exported to. The following is the default directory structure:

- Data files: <target directory>/data
- Archive files: <target directory>/archive
- Temp files: <target directory>/temp
- External files: <target directory>/external
- Script files: <target directory>/script

Note: The example on this page uses / for file separators which is relevant for Unix and Linux environments. If the target environment is Windows, the file separator will be \ .

The following procedure describes how to customize the directory layout.

### Procedure

1. During the virtual to physical export process, click **Advanced** in the V2P Wizard to see the target directory options.
2. You can customize any of the following:
  - **Data directory**
  - **Archive directory**
  - **Temp directory**
  - **External directory**
  - **Script directory**
3. Each directory will then be concatenated to the **Target directory** separated by the appropriate separator.

**i** Any one of **Target directory**, **Data directory**, **Archive directory**, **Temp directory**, **External directory**, **Script directory** can be blank. However, the combination of the fields must form an absolute path.

- Data files: <target directory>/<data directory>
- Archive files: <target directory>/<archive directory>
- Temp files: <target directory>/<archive directory>
- External files: <target directory>/<external directory>
- Script files: <target directory>/<script directory>

### Examples

Target directory is not empty

This means all target directories have a common root.

Input	Final directory layout
<ul style="list-style-type: none"> <li>• <b>Target directory:</b> /mytarget</li> <li>• <b>Data directory:</b> /mydata</li> <li>• <b>Archive directory:</b> /myarchive</li> <li>• <b>Temp directory:</b> /mytemp</li> <li>• <b>External directory:</b> /myexternal</li> <li>• <b>Script directory:</b> /myscript</li> </ul>	<ul style="list-style-type: none"> <li>• Data files: /mytarget/mydata</li> <li>• Archive files: /mytarget/myarchive</li> <li>• Temp files: /mytarget/mytemp</li> <li>• External files: /mytarget/myexternal</li> <li>• Script files: /mytarget/myscript</li> </ul>

Target directory is empty

All target directories may not have a common root. Note that external files and temp files share the same common root.

Input	Final Directory Layout
<ul style="list-style-type: none"> <li>• <b>Target directory:</b></li> <li>• <b>Data directory:</b> /mydata</li> <li>• <b>Archive directory:</b> /myarchive</li> <li>• <b>Temp directory:</b> /mytarget/temp</li> <li>• <b>External directory:</b> /mytarget/external</li> <li>• <b>Script directory:</b> /myscript</li> </ul>	<ul style="list-style-type: none"> <li>• Data files: /mydata</li> <li>• Archive files: /myarchive</li> <li>• Temp files: /mytarget/temp</li> <li>• External files: /mytarget/external</li> <li>• Script files: /myscript</li> </ul>

Target directory is empty and data directory /

Combined with [Customizing VDB file mappings](#), exporting data files to separate file systems is possible. In this example, `a.dbf` and `b.dbf` can be exported to `/filesystem1` and `/filesystem2` respectively. For Oracle VDBs, it is necessary to specify the parameter `useAbsolutePathForDataFiles` in order to export data files to separate file systems. See [CLI Cookbook: V2P \(virtual to physical\) of a single instance Oracle database with datafiles on separate file systems](#) for details.

Input	Final directory layout
<ul style="list-style-type: none"> <li>• <b>Target directory:</b></li> <li>• <b>Data directory:</b></li> <li>• <b>Archive directory:</b> /myarchive</li> <li>• <b>Temp directory:</b> /mytarget/temp</li> <li>• <b>External directory:</b> /mytarget/myexternal</li> <li>• <b>Script directory:</b> /myscript</li> <li>• <b>File mappings:</b> <ul style="list-style-type: none"> <li>• a.dbf : /filesystem1/a.dbf</li> <li>• b.dbf : /filesystem2/b.dbf</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Data files:/</li> <li>• /filesystem1/a.dbf</li> <li>• /filesystem2/b.dbf</li> <li>• Archive files: /myarchive</li> <li>• Temp files: /mytarget/mytemp</li> <li>• External files: /mytarget/myexternal</li> <li>• Script files: /myscript</li> </ul>

Target directory is empty and one of the subdirectories is empty would result in an error.

Input	Final Directories
<ul style="list-style-type: none"> <li>• <b>Target directory:</b></li> <li>• <b>Data directory:</b> /mydata</li> <li>• <b>Archive directory:</b></li> <li>• <b>Temp directory:</b> /mytarget/temp</li> <li>• <b>External directory:</b> /mytarget/myexternal</li> <li>• <b>Script directory:</b> /myscript</li> </ul>	<ul style="list-style-type: none"> <li>• INVALID</li> </ul>

 For parallel execution of V2P operations from the same target, make sure that the scripts directory name is unique.

## Manually recovering a database after V2P

This article describes how to manually recover a database after the V2P process.

**i** For the Oracle database, while running V2P, Delphix copies the datafiles and other required files on the physical storage. After that it performs the database recovery, followed by some post recovery steps and openDatabase.

While running V2P from CLI, you can set `recoverDatabase=false` and `openDatabase=false`.

While running V2P from UI, you can select not to openDatabase.

If `recoverDatabase=false` is set, run both `recover-vdb.sh` and `open-vdb.sh`.

If the V2P was performed with `recoverDatabase=true` and `openDatabase=false`, only run `open-vdb.sh`.

### Procedure

1. In the V2P target environment, navigate to the scripts directory for the exported database instance. You can find the scripts in a sub-directory named for that specific database instance. For Oracle databases, the path is `<target_directory>/<db_unique_name>/script/<instance name>`. For SQL Server databases, the path is `<target_directory>\<db_name>\scripts`.
2. For **Oracle** databases, locate the `recover-vdb.sh` and `open-vdb.sh` scripts, then run the required script(s) as described above (as `sh ./recover-vdb.sh` and `sh ./open-vdb.sh`).
- For **SQL server** databases, locate the script `Provision.ps1` and run it.
3. For **Oracle** databases, add the recovered database to `/etc/oratab` and **Refresh** the target environment for it to discover the recovered database. For **SQL server** databases, when the script completes, **Refresh** the target environment for it to discover the recovered database.

## V2P with unstructured files

This topic describes the procedure for performing virtual to physical (V2P) operations with unstructured files.

**i** V2P Not Supported for Unstructured Files on Windows V2P is not supported for unstructured files on Windows environments. Similar results to V2P may be achieved by provisioning a vFiles and copying data out of the vFiles to the local machine.

### Procedure

1. Log into the **Delphix management** application.
2. Select the dataset you want to export.
3. Select the snapshot you want to export.
4. From the **Actions (...)** menu select **Virtual to physical**.
5. Select the target environment.
6. Enter the **Mount path** for the export.  
The directory you enter here must exist in the target environment, and you must have permission to write to it.
7. Click **Next**.
8. Review the **Target environment** configuration information, and then click **Submit**.

## Hook scripts for automation and customization

Hook operations allow you to execute custom operations at select points during linking sources and managing virtual datasets. For example, you may want to prevent your monitoring systems from triggering during VDB startup and shutdown. In this case, you would leverage pre- and post-hooks to run required scripts for VDB start/stop operations.

Unix-based operating systems will execute hook scripts in bash, while Windows operating systems will execute using PowerShell.

Each Delphix object will have its own set of hooks you can create. To easily manage hooks across multiple datasets, you can create hook templates to apply the same hook to many objects.

### Setting hook operations

You can construct hook operation lists through the Delphix Management application or the command-line interface (CLI). You can either define the hooks as part of the provisioning process or edit them on virtual datasets that already exist.

Hook operations can be created in the Hooks tab of the Add dSource or Add VDB wizards.

To edit hook operations on a dataset, navigate to the datasets page and find the object's configuration. You will see a 'Hooks' tab where you can manage and modify hook operations.

### Hook operation templates

You can use templates to store commonly used operations, which allows you to avoid repeated work when an operation is applicable to more than a single virtual dataset. You manage templates through the Delphix Management application.

### Hook operations list

dSource hooks

Hook	Description
Pre sync	Pre Sync hook operations are executed before a Snapsync of a dSource. These operations can quiesce data to be captured during the Snapsync, or stop application processes that may interfere with the Snapsync operation.
Post sync	Post Sync hook operations are executed after a Snapsync operation of a dSource. These operations can undo any changes made by the pre-sync hooks. They will run regardless of the success of pre-sync hook operations or the Snapsync itself.

## Virtual database hooks

Hook	Description
Configure clone	<p>Operations performed after initial provision or after a refresh.</p> <p>This hook will run after the virtual dataset has been started.</p> <p>During a refresh, this hook will run before the Post Refresh hook.</p>
Pre refresh	<p>Operations performed before a refresh.</p> <p>This hook will run before the virtual dataset has been stopped.</p> <p>These operations can cache data from the virtual dataset to be restored after the refresh completes.</p>
Post refresh	<p>Operations performed after a refresh.</p> <p>This hook will run after the virtual dataset has been started and after the Configure Clone hook.</p> <p>This hook will not run if the refresh or Pre Refresh hook operations fail.</p> <p>These operations can restore cached data after the refresh completes.</p>
Pre rollback	<p>Operations performed before a rollback, also known as rewind.</p> <p>This hook will run before the virtual dataset has been stopped.</p> <p>These operations can cache data from the virtual dataset to be restored after the rewind completes.</p>
Post rollback	<p>Operations performed after a rollback, also known as rewind. This hook will not run if the rewind or Pre Rewind hook operations fail.</p> <p>This hook will run after the virtual dataset has been started.</p> <p>This hook will not run if the rewind or Pre Rewind hook operations fail.</p> <p>These operations can restore cached data after the rewind completes.</p>
Pre snapshot	<p>Operations performed before a snapshot.</p> <p>These operations can quiesce data to be captured during the snapshot, or stop processes that may interfere with the snapshot.</p>
Post snapshot	<p>Operations performed after a snapshot.</p> <p>This hook will run regardless of the success of the snapshot or Pre Snapshot hook operations.</p> <p>These operations can undo any changes made by the Pre Snapshot hook.</p>

Hook	Description
Pre start	Operations performed before the startup of a VDB or vFile. These operations can be used to initialize configuration files or stop processes that might interfere with the virtual dataset.
Post start	Operations performed after the startup of a VDB of vFile. These operations can be used to clean up any temporary files, or restart processes that may have been stopped by a Pre-Start hook, or log notifications.
Pre stop	Operations performed before the shutdown of a VDB or vFile. These operations can quiesce data or processes prior to the virtual dataset shutdown.
Post stop	Operations performed after the shutdown of a VDB or vFile. These operations can be used to log notifications, clean up any temporary files, or stop/restart related processes.

Order of execution of hooks for various VDB Operations

Provision	Refresh	Rollback	Snapshot	Start	Stop
Pre start	Pre refresh	Pre Rollback	Pre snapshot	Pre start	Pre stop
Post start	Pre stop	Pre stop	Post snapshot	Post start	Post stop
Configure clone	Post stop	Post stop			
Run masking job	Pre start	Pre start			
Pre snapshot	Post start	Post start			
Post snapshot	Configure clone	Configure clone			
	Run masking job	Run masking job			
	Post refresh	Post rollback			
	Pre snapshot	Pre snapshot			
	Post snapshot	Post snapshot			

## Staging server hooks

Staging Server hooks are currently applicable to SAP ASE and staged plugins (Db2, HANA, and PostgreSQL) environments, and will execute on the configured staging server.

Hook	Description
Pre validated sync	Operations performed on a staging server before validated sync. This hook will run before the validated sync operation whenever the validated sync run is triggered.
Post validated sync	Operations performed on staging server after validated sync. This hook will run after the validated sync operation whenever the validated sync run is triggered.

## Self-service interaction with hooks

These are the operations performed by the various Self-Service operations:

### **Rollback**

Reset, Undo, and any Restore or Branch operation using source point-in-time or a bookmark that's part of the current container.

### **Refresh**

Refresh and any Restore or Create Branch operation from any shared bookmark or when using the Template as the source of the restore (bookmark or point-in-time).

The Virtual Database Hooks described above will run accordingly. Snapshots are taken, for recovery purposes, before and after every operation that is performed. Bookmark operations will also initiate a snapshot.

## Setting hook operations

You can construct hook operation lists through the Delphix Management application or the command-line interface (CLI). You can either define the operation lists as part of the provisioning process or edit them on virtual datasets that already exist.

Setting hook operations through the Delphix management application

 The provisioning wizard still imports hook operations from templates.

Hook operations can be provisioned in the **Hooks** tab of the Add dSource or Add VDB wizards.

1. Select the **type of operation** and enter a name, operation type, and script.
2. To remove an operation from the list, click the **Trash** icon on the operation.
3. When you have set all hook operations, click **Next** to continue with the provisioning process.

To edit hook operations on a virtual dataset:

 From the **Datasets** panel, you can create hook operations from a template.

1. In the **Datasets** panel, click the virtual dataset.
2. Click the **Configuration** tab.
3. Within the **Configuration** tab, click the **Hooks** tab.
4. Select the **hook** to edit.
5. The current operations at this hook will be displayed. To edit this list of operations, click the **Pencil** icon in the top right-hand corner of the tab.
6. Click the **Plus** icon to add a new operation.
7. Select the **type of operation** or click  to load a hook operation template.
8. Click the **text area** and edit the contents of the operation.
9. To remove an operation from the list, click the **Trash** icon on the operation.
10. When you have set all hook operations, click the **checkmark** to save the changes.

 The provisioning wizard still imports hook operations from templates.

Setting hook operations through the CLI

To specify hook operations during linking, edit the relevant hook's array of operations defined on the `LinkingParameters > Source > Operations` object.

To specify hook operations during provisioning, edit the relevant hook's array of operations defined on the `ProvisionParameters > Source > Operations` object.

To edit hook operations on a dSource that already exists, edit the relevant hook's array of operations defined on the `Source > Operations` object.

To edit hook operations on a virtual dataset that already exists, edit the relevant hook's array of operations defined on the `Source > Operations` object.

For more information about these CLI objects, see the following documentation in the **Help** menu of the **Delphix management** application:

- `LinkedSourceOperations`

- `VirtualSourceOperations`
- `RunCommandOnSourceOperation`
- `RunExpectOnSourceOperation` API

Example of editing hook operations through the CLI

1. Navigate to the relevant source's `VirtualSourceOperations` object.
2. Select a **hook** to edit.

```
delphix> source
delphix source> select "pomme"
delphix source "pomme" > update
delphix source "pomme" update *> edit operations
delphix source "pomme" update operations *> edit postRefresh
```

3. Add an operation at index 0.

```
delphix source "pomme" update operations postRefresh *> add
delphix source "pomme" update operations postRefresh 0 *> set
type=RunCommandOnSourceOperation
delphix source "pomme" update operations postRefresh 0 > set command= "
echo Refresh completed."
delphix source "pomme" update operations postRefresh 0 > ls
Properties
  type: RunCommandOnSourceOperation ( )
  command: echo Refresh completed. ( )
delphix source "pomme" update operations postRefresh 0 *> commit
```

4. Add another operation at index 1 and then delete it.

```
set command="echo Refresh completed." delphix source "pomme" update
operations postRefresh *> add
delphix source "pomme" update operations postRefresh 1 *> set
type=RunCommandOnSourceOperation
delphix source "pomme" update operations postRefresh 1 *> set command= "
echo Refresh completed."
delphix source "pomme" update operations postRefresh 1 *> back
delphix source "pomme" update operations postRefresh *> unset 1
delphix source "pomme" update operations postRefresh *> commit
```

## Passing credentials securely to hook operations

Sometimes, commands in hook operations need credentials to perform tasks such as making API calls or managing local services. To avoid hard-coding credentials in the hook code, you can pass credentials securely to hooks via environment variables using a new list property of each hook operation. The elements in this list define a set of environment variables and the credentials to pass to the hook in those variables.

In the browser, the list can be viewed and updated in the **Credential environment variables** section of a hook operation. (Hook operations can be accessed in the dataset and hook template creation dialogs and view/edit pages.) For example, to view or edit hook credentials for a dataset:

1. Login to the **Delphix management** application.
2. Under **Datasets**, select a **dSource** or **VDB**.
3. Select the **Configuration** tab and then the **Hooks** tab.
4. Select a hook operation.
5. To make any changes, such as adding, modifying or deleting credentials, click on the edit icon to the right of **Operation type**.

The screenshot shows the Delphix Management web interface. The top navigation bar includes 'DELPHIX MANAGEMENT', 'Manage', 'Resources', 'System', and 'Help'. The left sidebar shows a tree view of datasets, with 'DBOMSRPRE2' (dSource - Active) selected under the 'production' environment. The main content area displays the configuration for the 'prepare jobs' hook operation. The configuration is organized into tabs: 'Timeflow', 'Status', 'Configuration', 'Source', 'Policies', 'Data Management', 'Masking', and 'Hooks'. The 'Hooks' tab is active, showing a list of hook operations. The 'prepare jobs' operation is selected, and its configuration is displayed in a modal window. The configuration includes the following sections:

- Hook Points:** A list of hook points under 'Pre Sync' and 'Post Sync'. The 'prepare jobs' operation is listed under 'Pre Sync'.
- Operation Type:** Run Bash Shell Command.
- Credential Environment Variables:** A table with the following entries:
 

Base Variable Name	Value
Type	Password Vault
Vault	cyberark02
Query String	Safe=Production;Object=Jenkins
Base Variable Name	GITHUB
Type	Password
Password	*****
- Script:** A text area containing the command: `/home/oracle/prepare_jobs.sh $JENKINS_PASSWORD $GITHUB_PASSWORD`

In the API and CLI, the credentials list property of each hook operation is an array called `credentialsEnvVarsList`.

Hook credentials can be configured directly as a password or key (entered by the user) or indirectly by selecting a password vault and a location in that vault. Credentials entered directly are managed securely by the engine in the same way as other passwords and keys, which are encrypted in disk and neither logged nor exposed by the API, whereas vault credentials are managed securely and externally to the engine by a specialized product such as CyberArk or HashiCorp Vault that has already been [configured in the engine](#). Credentials stored in a vault are always retrieved by the engine just before executing the hook, so they will always contain the latest values. Any number of credentials of any type can be defined for an operation in the `credentialsEnvVarsList` property.

Four types of credentials can be defined for hooks:

- `CyberArkVaultCredential`
- `HashiCorpVaultCredential`
- `PasswordCredential`
- `KeyPairCredential` (supported only via the API and CLI at the moment)

For more information on each of these types, visit your engine's API page for that type at <https://<engine address>/api/#<type name>> (you must log in first).

To illustrate, consider a hook that needs to authenticate to two different APIs, one using an API key entered directly by the user and another using a username and password managed by a vault. The user can configure the credential variables as follows:

```
delphix source "pomme" update operations postRefresh *> edit
0.credentialsEnvVarsList
delphix source "pomme" update operations.postRefresh 0 credentialsEnvVarsList
*> adddelphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 0 *> set baseVarName=API1delphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 0 *> edit credentialsdelphix
source "pomme" update operations.postRefresh 0 credentialsEnvVarsList 0
credentials *> set type=PasswordCredentialdelphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 0 credentials *> set
password="API-KEY-02a0b73f"delphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 0 credentials *> backdelphix
source "pomme" update operations.postRefresh 0 credentialsEnvVarsList *>
adddelphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 1 *> set baseVarName=API2delphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 1 *> edit credentialsdelphix
source "pomme" update operations.postRefresh 0 credentialsEnvVarsList 1
credentials *> set type=CyberArkVaultCredentialdelphix source "pomme" update
operations.postRefresh 0 credentialsEnvVarsList 1 credentials *> set
queryString="Safe=Apis;Folder=Root\Service2;Object=ApiClient"delphix source
"pomme" update operations.postRefresh 0 credentialsEnvVarsList 1 credentials
*> set vault=MyCyberArk1delphix source "pomme" update operations.postRefresh 0
credentialsEnvVarsList 1 credentials *> commit
```

When this hook executes, it will receive two sets of environment variables containing the corresponding credentials: `API1_PASSWORD` with value `API-KEY-02a0b73f` and variables `API2_USER` and `API2_PASSWORD` containing the values stored in the vault `MyCyberArk1` at the location of the provided query string. The `API2` credentials are retrieved from the vault just before the hook executes, so they will always contain the latest values.

The complete list of environment variables that may be available to a hook is:

- `<base name>_USER` : user name. Present only if the credentials are of a vault credential type and the entry in the vault contains a user name.
- `<base name>_PASSWORD` : a password. Present for `PasswordCredential` . Also present in case of a vault credential type and the vault entry contains a password.
- `<base name>_PRIVKEY` : a private key. Present for `KeyPairCredential` . Also present in case of a vault credential type and the vault entry contains a private key.
- `<base name>_PUBKEY` : a public key. Present for `KeyPairCredential` . Also present in case of a vault credential type and the vault entry contains a public key.

## Hook operation templates

You can use templates to store commonly used operations, which allows you to avoid repeated work when an operation is applicable to more than a single virtual dataset. You manage templates through the Delphix Management application.

### Hook operations templates not available via CLI

Hook operation templates cannot be fully utilized from the CLI. Manage and use hook operations through the Delphix Management application.

## Creating a hook operation template

 The provisioning wizard still imports hook operations from templates.

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Operation templates**.
4. Click the **Plus** icon to add a new operation template.
5. Enter a **Name** for the template.
6. Select an operation **Type**.
7. Enter a **Description** detailing what the operation does or how to use it.
8. Enter operation **Contents** to implement the operation partially or fully.
9. Click **Create**.

## Importing a hook operation template

To import a hook operation template:

1. In the **Datasets** panel, select a dataset.
2. Click the **Configuration** tab.
3. Within the **Configuration** tab, click the **Hooks** tab.
4. Select the **hook** to edit.
5. Click the **Plus** icon to add a new operation.
6. Click **Import**.
7. Select the **template** to import.
8. Click **Import**.
9. When you have set all hook operations, click **Check** to save the changes.

## Exporting a hook operation template

To export a hook operation template:

1. In the **Datasets** panel, select a dataset.
2. Click the **Configuration** tab.
3. Within the **Configuration** tab, click the **Hooks** tab.
4. Select the **hook** to edit.
5. Click the **Plus** icon to add a new operation.
6. Select the **type of operation**.
7. Click the **text area** and edit the contents of the operation.
8. Click **Export**.
9. Enter a **Name** for the template.
10. Enter a **Description** detailing what the operation does or how to use it.
11. Click **Export**.

## Considerations for Delphix hook operations on Oracle RAC VDBs

When performing data management operations like SnapSync, refresh, and so on with Delphix data sources such as VDB and dSources, Delphix offers "hooks" as an ability to perform tasks prior to and after these data management operations. For an introduction and more details about hooks refer to, [Oracle hooks for data sources](#)

Mostly the above article discusses shell operations within the hooks. But sometimes you might need to run a SQL script within the hook to capture or alter the database state before or after a Delphix operation on that source. In a sample scenario, we might be connecting to the database and running some SQL script that does the operations and perhaps generates some files for later use.

In such a case, there is no need to set the Oracle environment in the script, and in fact, setting the ORACLE\_SID value in the script can be a problem for RAC instances. From the article linked above, these are the details of hook operations as they relate to RAC VDBs:

### Oracle RAC

When linking from, or provisioning to Oracle RAC environments, hook operations will not run once on each node in the cluster. Instead, the Delphix Engine picks a node in the cluster at random and guarantees all operations within any single hook will execute serially on this node.

 The Delphix Engine does not guarantee the same node is chosen for the execution of every hook but does guarantee that Pre-/Post- hook pairs (such as Pre-Sync and Post-Sync) will execute on the same node.

If the data source (or VDB) is a single instance Oracle, explicitly setting variables in the script should not be a problem, since the local listener will be aware of the SID in the connect string. But for a RAC, since we will not be sure which node the hook will run against beforehand, do not statically allocate the variables, the engine will determine the connection string based on the databases section of the environments page of the admin app GUI.

### Troubleshooting

Hook operations do not work for Delphix RAC installations.

### Resolution

Remove any oracle environment setting parameters in the script and consider that the hook will run arbitrarily against any of the RAC nodes. Validate that the connect string works for the **Environment>Databases** section for the dSource in question.

### Additional information

For more information about validating and setting connection strings refer to, [Adding JDBC connection string](#)

## Cookbook of common scripts for hooks on SQL server

Customization is a huge topic and there are hundreds of ways to customize Delphix operations using hooks, but here are some example scripts which have shown up as common, and are presented here to provide guidance for building hooks.

- [Common Scripts For Hooks](#)
- [Example Powershell Script for Debugging](#)
- [Example PowerShell Script for Email Notification](#)
- [Example Powershell Script for Executing Stored Procedures](#)
- [Sample Configure Clone Hook for SQL Server](#)
- [Sample Post-Start Hook to Add CDC Jobs](#)
- [Sample Pre- and Post-Refresh Hook for SQL Server](#)

## Common scripts for hooks

### What Are hooks?

Hooks are programmatic call-outs embedded before and after dataset manipulation operations within the Delphix Engine. These programmatic call-outs provide the ability for the Delphix Engine to run custom-built PowerShell scripts directly on the Windows database server.

### Hooks and data operations

Delphix dSources are manipulated by "Sync" operations, in which the Delphix Engine captures data changes from backups of the source database appends them to the dSource. The pre-sync and post-sync hooks are executed in PowerShell by the "environment user" Windows domain account (delphix\_trgt) on the staging target. Since the dSource is a database in recovery mode within the SQL instance on the staging target, no database operations can be performed on the dSource itself, but file-operations on the staging target are possible.

Delphix **VDBs** are manipulated by Provision, Refresh, Rewind, Snapshot, Start, and Stop operations. The Configure Clone, Pre-Refresh, Post-Refresh, Pre-Rewind, Post-Rewind, Pre-Snapshot, Post-Snapshot, Pre-Start, Post-Start, Pre-Stop, and Post-Stop hooks are executed in PowerShell by the Windows "environment user" Windows domain account (delphix\_trgt) on the VDB on the target.

Here are some example use-cases and solutions using hooks:

- Your organization might require that a notification be sent to a distribution list five minutes before anyone refreshes or rewinds a VDB that is used for development or testing. You can write and test that logic in a PowerShell script and then embed it into the Pre-Refresh, Pre-Rewind, and Pre-Stop hooks on all VDBs. This PowerShell script can send email to a specified distribution list, and then pause for 300 seconds (5 minutes) before allowing the operation to continue.
  - [PowerShell scripting example for email notification during Pre-Refresh and Pre-Rewind hooks](#)
- Update data within a VDB when it is first provisioned and again after each refresh from the dSource. A very common example of this is data masking or anonymization, to prevent confidential data from being visible to the users and administrators of the VDB. Delphix has integrated data masking, but you can still initiate the appropriate job and poll until it completes using a PowerShell script.
- During a refresh of a VDB from the dSource, save the non-production database and application passwords, then restore them after the refresh is complete.
  - [PowerShell scripting example for stored procedure execution during Pre-Refresh and Post-Refresh hooks](#)
- Debug the sequence and timing of dataset manipulation operations within the Delphix Engine by logging hook executions to a file
  - [PowerShell scripting example for debugging output to be generated during all VDB hooks](#)

There are many more potential use-cases for hooks, but hopefully, these examples will begin to show the way.

## Example powershell script for debugging

### Description

This is the Windows PowerShell code for a script named **display.ps1**, which you can insert into any pre-script, post-script, or hook to display a timestamp and the values of the Windows environment variables to a log file located in the **C:\TEMP** directory on the target host. One purpose of this script, if inserted into every hook, is to better understand the order of operations within the Delphix Engine. It would also help you understand the duration of those operations.

Of course, this basic script is intended to be augmented for more custom diagnostic output, as desired.

### Disclaimer

Example powershell script for executing stored procedures

Description

The Powershell script (below) makes a call to the stored procedure, whose fully-qualified name is passed as a parameter. This particular script is written so that the stored procedure expects only one parameter named "@DatabaseName". Please note that pre and post-scripts can only be executed on VDBs on the VDB target host. If "@DatabaseName" is not unique enough, then the script can be modified to add "@InstanceName" as well.

The script logs debugging information to a log file created within the "Desktop" directory of the Delphix "environment user" Windows account. This log file is directed to "C:\TEMP" in this example, but of course, can be modified as suitable in your environment.

## Sample configure clone hook for SQL server

### How the configure clone hook works

The Delphix Engine executes the **Configure clone** hook after the initial provisioning of a virtual database (VDB) and after each refresh of that VDB. However, during refresh operations, the **Configure clone** hook runs before the **Post-refresh** hook.

Because it executes after the Delphix Engine brings fresh data from the dSource into the VDB, the Configure Clone hook is an ideal place for data masking and other obfuscation and reconfiguration operations to occur.

The Windows PowerShell script (shown below) is intended to demonstrate how to call the HTTP interface of the Delphix DmSuite v4.7.3 from a Configure Clone hook.

Sample post-start hook to add CDC jobs

Sample post-start hook for CDC

This script will add Change Data Capture (CDC) capture and cleanup jobs on provisioned virtual databases.

```
$VDB_NAME = $env:VDB_DATABASE_NAME

$VDB_INSTANCE = $env:VDB_INSTANCE_NAME

SQLCMD -b -d $VDB_NAME -r0 -Q "EXEC sys.sp_cdc_add_job @job_type = N'capture';EXEC
sys.sp_cdc_add_job @job_type = N'cleanup'" -U <Username> -P <Password> -S ".\
$VDB_INSTANCE"

exit $LastExitCode
```

Sample post-start hook for CDC if provisioning is done from a lower database version to SQL2016 or above

This script will add CDC capture, cleanup jobs, and upgrade CDC metadata on provisioned virtual databases.

```
$VDB_NAME = $env:VDB_DATABASE_NAME

$VDB_INSTANCE = $env:VDB_INSTANCE_NAME

SQLCMD -b -d $VDB_NAME -r0 -Q "EXEC sys.sp_cdc_add_job @job_type = N'capture';EXEC
sys.sp_cdc_add_job @job_type = N'cleanup';EXEC sys.sp_cdc_vupgrade;" -U <Username> -P
<Password> -S ".\$VDB_INSTANCE"

exit $LastExitCode
```

 Place real username and password at respective placeholders while using the scripts.

## Sample pre- and post-refresh hook for SQL server

### How Pre- and Post-refresh hooks work

The Delphix Engine executes the Pre-Refresh hook before each refresh operation on a virtual database (VDB). It executes the Post-Refresh hook after each refresh operation. If a Configure Clone hook is also defined, then the Post-Refresh hook executes after all Configure Clone hooks.

Generally, after the initial provisioning of a VDB, changes are made to that VDB which should be saved across refreshes. Examples include resetting passwords to production accounts, adding non-production accounts, database references to other databases in production or non-production, and so on.

The Pre-Refresh hook is the first step of a process to capture the data to be saved, ending with the Post-Refresh hook to re-apply all that was captured, after the refresh has completed. So, the order of execution is:

1. Zero, one, or more **Pre-refresh** hook(s)
2. The **Refresh** operation itself on the VDB
3. Zero, one, or more **Post-refresh** hook(s)

The Windows PowerShell script (shown below) is intended to demonstrate how to call a SQL Server stored procedure, taking a single parameter for the VDB database name. In a Pre-Refresh hook, a custom-built stored procedure (named MSDB.DBO.CAPTURE\_DB\_SETTINGS) can be called to capture all data, and store it in (for example) the MSDB system database, or in a file on the Windows target host server. In a Post-Refresh hook, a custom-built stored procedure (named MSDB.DBO.APPLY\_DB\_SETTINGS) can be called to access all the data captured by the Pre-Refresh hook and re-apply it into the newly-refreshed VDB.

So, assuming that the Windows PowerShell script below is stored in a file named CALLSP.PS1 within a directory on the VDB target host named D:\DELPHIX\SCRIPTS, the call syntax within the Pre-Refresh hook might look something like this:

```
D:\Delphix\Scripts\callsp.ps1 MSDB.DBO.CAPTURE_DB_SETTINGS
```

...and the call syntax within the Post-Refresh hook might look something like this:

```
D:\Delphix\Scripts\callsp.ps1 MSDB.DBO.APPLY_DB_SETTINGS
```

Be aware that Delphix hooks set the following Windows environments from a VDB:

- VDB\_DATABASE\_NAME – the name of the Delphix VDB (not the SQL Server database)
- VDB\_INSTANCE\_NAME – the name of the SQL Server instance
- VDB\_INSTANCE\_PORT – the port number of the SQL Server instance
- VDB\_INSTANCE\_HOST – the name of the Windows host on which the SQL Server instance resides

You can access the values in these environment variables within PowerShell using the `$env:variable-name` syntax, as shown in the code below.

### Sample code

Below is a sample code for the **callsp.ps1** script.

## Managing policies

These topics describe creating and managing SnapSync, LogSync, Retention, and VDB Refresh policies.

- [Policies for Scheduled Jobs](#)
- [Creating Custom Policies](#)
- [Policies and Time Zones](#)
- [Configuring Retention on Individual Snapshots](#)

## Policies for scheduled jobs

### Introduction

Creating policies is a great way to automate the management of datasets in Delphix. Whether for syncing data, taking snapshots, or refreshing virtual databases, policies ensure that data is ready when needed.

In order to create policies, navigate to the ‘Manage’ dropdown and select ‘Policies’.

There are five categories of policies that the Delphix Engine uses in conjunction with datasets objects:

- **SnapSync** – How often snapshots of a source database are taken for a dSource.
- **VDB snapshot** – How often snapshots are taken of the virtual database (VDB).
- **Retention** – How long snapshots and log files are retained for dSources and VDBs.
- **VDB refresh** – Automatic refresh of a VDB, either with the most recent snapshot or latest Timeflow logs. The default setting for this policy is **None**.
- **Replica retention** – How long snapshots are retained on replicated namespaces for dSources and VDBs after they have been deleted on the replication source. Retention of snapshot applies as long as the database is not deleted on the source. If the database is deleted, then the next replication update will delete the database and the retained snapshots on the replication target.

#### Avoid adding conflicting policies

The following example case can occur if the Snapshot policy is set to NONE, this has a direct impact on the retention policy and potential VDB data growth: An engine encountered a domain0 space issue that resulted from the archive logs on a single VDB taking up 25% of the pool. That engine was set to use a ‘None’ Snapshot policy along with a 1-week log retention policy. Because the archive logs were needed to provision from the one and only snapshot that existed, the engine was unable to enforce the retention policy.

There can be default or custom policies for each of these categories.

Policy type	Description	User access
Default	Default policies exist at the domain level and are applied across all objects in a category.  The settings of a default policy in a category can be modified, but their names cannot be changed.	<ul style="list-style-type: none"> <li>• Users with Delphix Admin credentials</li> </ul>
Custom	Custom policies allow for the creation of unique policies to fit any schedule requirements. These can be setup with varying time intervals, ranging from minutes to days.	<ul style="list-style-type: none"> <li>• Users with Delphix Admin credentials</li> <li>• Group and object owners</li> </ul>

### Setting different policies for objects in a group

Policies applied at the group level will affect all objects in that group. To set different policies for objects in a group, apply the policies at the group level first, then apply policies at the object level.

### SnapSync Policies

SnapSync policies determine how often snapshots of the source database are taken.

In the Default SnapSync policy, a snapshot is taken daily at 3:30 AM local time and will cancel if not completed within four hours. If SnapSync does not complete within this four hour period, it will resume at the next scheduled daily time until the process is complete.

Click the 'Edit' icon to change the Default SnapSync policy, or click the 'Add' icon to create a new SnapSync policy.

 Policies may be configured using the provided Schedule date picker, by Interval, or by using a Quartz cron expression when selecting Custom.

### Retention policy

A Retention Policy defines how long the Delphix Engine retains snapshots and log files, which are used to rewind or provision objects from past points in time. The retention time for snapshots must be equal to or longer than the retention time for logs.

To support longer retention times, more storage may need to be allocated to the Delphix Engine. The retention policy – in combination with the SnapSync policy – can have a significant impact on the performance and storage consumption of the Delphix Engine. Retention policies can be customized to retain snapshots and logs for longer periods, enabling usage to specific points further back in time.

### Replica retention policy

Replica Retention policy defines how long the snapshots are retained on replicated namespaces for dSources and VDBs, after they have been deleted on the replication source.

Normally, the snapshots that have been deleted on the replication source engine are also deleted on the replication target engine. A new retention policy is introduced to provide an extended lifetime of such snapshots on the replication target. The Replica Retention Policy is targeted and defined on the replication target. This policy can be applied to an entire replica namespace or could target specific groups or dSource/VDBs within the replica namespace.

Use the replica snapshots on the replication target to provision or refresh VDBs. Point-in-time provisioning may not be possible for these snapshots, this is done to optimize the disk space usage on the replication target.

 The replica retention policy can only be used to extend (**not to reduce**) the lifetime of the replica snapshots.

Extended replica snapshots can be deleted in the following cases:

- Similar to replicated snapshots, Extended replica snapshots cannot be deleted manually. They can only be removed by adjusting the policy duration so the snapshot is no longer covered.
- If the entire dSource or VDB is deleted, the extended replica snapshot will be deleted on the replication target as well.
- Oracle virtual PDBs require their CDB to be present and, if the CDB is deleted or is not replicated, then the extended replica snapshots on both the deleted CDB as well as the dependent virtual PDB will be deleted on the replication target. This can happen in a rare scenario where an Oracle virtual PDB is migrated from one CDB to another. Once the virtual PDBs snapshots that reference the old CDB are deleted, the old CDB can also be deleted. The snapshots on the virtual PDB that depend on the old CDB will not be covered by extended replica retention on the replication target.

The replica retention policy runs automatically on a schedule to cleanup expiring snapshots or whenever a replication receive job is executed.

### Benefits of longer retention

With increased retention time for snapshots and logs, a longer (older) rollback period for data is allowed.

Common use cases for longer retention include:

- SOX compliance
- Frequent application changes and development
- Caution and controlled progression of data
- Reduction of project risk
- Speed of rollback or restoring to older points in time

## Creating custom policies

This topic describes creating custom policies based on cron expressions for specific database objects or groups.

Custom policies are created by editing a policy associated with a database object, either during its creation or through the **Policy management** screen after it has been created. For information about creating custom policies for dSources and VDBs during the linking and provisioning processes, see the **Linking** and **Provisioning** topics listed for each data platform.

 Policies may be configured using the provided Schedule date picker, by Interval, or by using a Quartz cron expression by selecting Custom.

### Procedure

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Policies**.
4. Select the **tab** for the object or group for which you want to create a policy.
5. In the selected tab click the **Add** button located on the right. For example, to create a new VDB Snapshot policy:
  - a. Select the **VDB snapshot** tab.
  - b. Click **+ VDB snapshot**.
6. Enter **Name** for the policy.
7. Select a **Time Zone**, if this is not selected Delphix picks up the system default time.
8. Select **Timeout**. When a job is run if it does not finish in the selected time it will be killed.
9. Select a **Schedule**.
10. Select **Next**.
11. Select the object(s) to which you want to assign this policy.
12. Click **Submit**.

## Policies and time zones

### Policies and time zones

You can configure the SnapSync, VDB Snapshot, and VDB Refresh policies with the time zone in which the policy should be scheduled.

To edit the time zone of a policy:

1. Login to the **Delphix management application**.
2. Click **Manage**.
3. Select **Policies**.
4. Click on the **pencil** icon located next to the selected policy.
5. Select the appropriate time zone from the drop-down list.
6. Click **Submit**.

 Retention and Quota policies are not schedulable and do not need a time zone.

### Upgrading to version 4.2 or higher:

Prior to version 4.2, a policy operated under the time zone of the policy’s target. For example, a SnapSync Policy scheduled for 4:00 am every day that targeted a dSource in Eastern Standard Time (EST) and a dSource in Pacific Standard Time (PST) fired twice a day: once at 4:00 am EST and once at 4:00 am PST.

To maintain the same behavior of the Delphix Engine after an upgrade, the upgrade process clones existing policies with these clones differing only in their time zone. After upgrading, you may notice that the names of policies change to include the time zones in which they operate.

 Default policies are not cloned and always operate under the timezone of the Delphix Engine.

### Example of an upgrade engine

In this example, the dSources and VDBs originally operated under either EST (America/New\_York) or CST (America/Mexico\_City), and new policies were created to reflect this.

Original policy	New policies
UserSnapSync	UserSnapSync (America/Mexico_City) UserSnapSync (America/New_York)
SnapshotTest	SnapshotTest (America/Mexico_City) SnapshotTest (America/New_York)
UserRefresh	UserRefresh (America/Mexico_City) UserRefresh (America/New_York)

After an upgrade, ensure that the policies are configured as expected; it may have been unclear prior to this upgrade when policies were actually firing.

Also, after upgrading to 4.2 or higher, you may consolidate/clean-up the clones and these changes will persist through future upgrades. If you go to the policy tab, and click on a policy you should see a timezone field. This timezone field is editable. So for example, if you had "VDB\_SNAP (US/Arizona)" and "VDB\_SNAP (America/

Phoenix)", you could delete one of the duplicates (they are both from the same time zone in this case), make sure the timezone field is set to the desired time zone and rename the remaining policy to "VDB\_SNAP".

## Configuring retention on individual snapshots

This topic describes adding a custom retention definition for individual snapshots. This value will override that of the policy currently assigned to the container, for example, if 'forever' is selected then the snapshot will no longer be deleted via the retention policy.

### Procedure

1. Log into the **Delphix management** application.
2. Select **Resources > storage capacity**.
3. Expand the object (dsource or vdb) to modify.
4. Expand the snapshots. (it may take a few minutes for the individual snapshots to appear)
5. To configure the desired value in the 'keep until' column, click the figure in the column.
6. In the Keep For dialog either enter the **number of days** or tick **forever**.
7. Click **Save**.

## Accessing the Delphix engine

### The admin and sysadmin user roles

After installation, you will have two users: **sysadmin** and **admin**. Email addresses are required inputs for both accounts.

 When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling delphix\_admin.

You can create additional sysadmin and admin users, as well as other users with more restricted privileges, as described in the topics under [Managing System Administrators](#)

User	Initial password	Abilities and duties
<b>sysadmin</b>	sysadmin	<p>Typical system administration duties such as:</p> <ul style="list-style-type: none"> <li>• modifying NTP, SNMP, SMTP settings</li> <li>• managing storage</li> <li>• downloading support logs for the Delphix Engine</li> <li>• performing upgrades and patches.</li> </ul> <p>Launches the initial <b>Server Setup</b> configuration application</p> <p>Has access to the Command Line Interface (CLI)</p>
<b>admin</b>	delphix	<p>Manages data objects, all collectively referred to as the Delphix Engine "domain":</p> <ul style="list-style-type: none"> <li>• dSources</li> <li>• virtual databases (VDBs)</li> <li>• users</li> <li>• groups</li> <li>• related policies and resources</li> </ul> <p>Manages the Delphix Engine domain using either the browser-based <b>Engine Admin</b> application or the Command Line Interface (CLI).</p>

### Access methods

There are three main interfaces to a Delphix Engine:

- Web browser (http or https)
- Command Line Interface (CLI) through ssh
- Delphix Web APIs

### Accessing a Delphix engine with a web browser

In order to reach the main Engine Administrator and Delphix Management application (GUI), you can use http or https:

**http://<engine IP or hostname>**

or

**https://<engine IP or hostname>**

 In order to use your hostname, your DNS Administrator must add the hostname and IP Address to your DNS system.

The Delphix management application

By default, the GUI login screen of a Delphix Engine will log you into the Delphix Management application, as that is where a majority of the day-to-day activities will take place, such as attaching of source databases and VDB provisioning. There is a link (Setup) to the Delphix Server Setup application.

If you are already logged into the Delphix Setup application, then you can switch to the Delphix Management login by clicking “Management” in the upper-right corner of the Delphix Setup screen:

The Delphix setup GUI

If accessing the Delphix Engine to perform system administrator actions (adding storage, changing system-level parameters), you will need to switch the login screen to the Delphix Setup login by clicking **Server setup** on the default login screen.

If you are already logged into the Delphix Management GUI, you can switch to the Server Setup login screen by clicking the username in the upper-right corner of the GUI and selecting “Setup”:

## Accessing a Delphix engine using the CLI

Using the Delphix CLI is useful for various situations:

- Limited bandwidth connections where a GUI is too “heavy”
- Flash is prohibited on browsers
- Users who prefer not to use a GUI
- Automation scripts

You access the Delphix CLI through an SSH session. Like the GUI, there are separate CLIs for the Engine Administrator and Delphix Sysadmin roles. The appropriate CLI is automatically selected based on the role that has been granted to you.

Using your SSH client of choice, access the Delphix Engine in a method similar to the following:

```
ssh <user>@<engine IP or hostname>
```

Where <user> is a pre-defined user on the Delphix Engine, and <engine IP> is the IP address of a Delphix Engine.

```
ssh delphix_admin@dlpxengine1
```

All Delphix functionality is available via the CLI. For further information on using the Delphix CLI, see [Command Line Interface Guide](#)

## Accessing a Delphix engine using the Delphix web API

Delphix offers a set of RESTful web service APIs with which you can administer a Delphix Engine. Using Web API calls allows you to create powerful, complex automation, often in coordination with other technologies like Jenkins,

Puppet, Chef, and Ansible. All Delphix functionality is available via the Web API. The use of the Web API is outside the scope of this document, but there is additional information in the [Delphix Web Service API Guide](#)

## IBM Db2 environments and data sources

In this section, we will describe all the different Delphix and Db2 components that are part of the Continuous Data solution for IBM Db2 database.

This section covers the following topics:

- [IBM Db2 overview](#)
- [Delphix architecture with Db2](#)
- [Db2 plugin installation and upgrade](#)
- [How to use dlp\\_x\\_db\\_exec privilege elevation script](#)
- [Quick start guide for Db2](#)
- [Db2 support and requirements](#)
- [Managing Db2 environments and hosts](#)
- [Linking data sources and syncing data with Db2](#)
- [Provisioning and managing VDBs from Db2 dSources](#)
- [Db2 hook operations](#)
- [Enhanced logging for Db2 plugin](#)

## IBM Db2 overview

### Introduction to Db2

Db2 for Linux, UNIX, and Windows (LUW) is a database server product developed by IBM. Db2 LUW is the "Common Server" product member of the Db2 family, designed to run on most popular operating systems.

The version numbers in Db2 are non-sequential with v11.1 and 11.5 being the two most recent releases. Specifics of Db2 versions and platforms supported on Delphix are located in the [Db2 Compatibility Matrix](#)

### IBM Db2 authentication

Db2 User and group authentication is managed in a facility external to Db2 LUW, such as the operating system, a domain controller, or a Kerberos security system. This is different from other database management systems (DBMSs), such as Oracle and SQL Server, where user accounts may be defined and authenticated in the database itself, as well as in an external facility such as the operating system.

Any time a user ID and password is explicitly provided to Db2 LUW as part of an instance attachment or database connection request, Db2 attempts to authenticate that user ID and password using this external security facility. If no user ID or password is provided with the request, Db2 implicitly uses the user ID and password that were used to login to the workstation where the request originated. More information on Db2 authentication and authorization is available via [IBM documentation](#)

#### **Delphix Db2 authentication**

Delphix for Db2 requires that the staging and target hosts must already have the necessary users and authentication systems created/installed on them. Delphix will neither create users nor change database passwords as part of the provisioning process.

### Db2 Database level support

Delphix supports a number of Db2 database-level features. An overview of Db2 database level support is as follows:

- Support for multiple databases linking in a Single Instance, which allows Delphix Engine users to utilize an available instance on the target more efficiently.
- Support for using a customer-supplied directory for the Delphix Plugin, Db2 Mount Points, and Db2 Delphix files and logs.
- Support for the in-memory BLU feature of Db2.
- Support for Kerberos environments.
- Support for VDB provisioning of the same OS version level or one version higher than the source and staging instances.
- Intelligent handling of HADR logs.

### High availability disaster recovery (HADR)

The HADR feature of IBM Db2 provides a high availability solution for both partial and complete site failures. It protects against data loss by replicating data changes from a source database, called the primary, to one or more target databases, called the standby.

#### Delphix HADR support

HADR replication takes place at a database level, not at the instance level. Therefore, a standby instance can have multiple databases from multiple different primary servers/instances on it. If the instance ID on the Delphix standby

is not the same as the instance ID on the primary, the Delphix standby instance ID must have database permissions **secadm** and **dbadm** granted to it on the primary database. These permissions and all HADR settings must be implemented on the primary database before you take the backup on the primary database.

### Log transmitting

All changes that take place at the primary database server are written into log files. The individual log records within the log files are then transmitted to the secondary database server, where the recorded changes are replayed to the local copy of the database. This procedure ensures that the primary and the secondary database servers are in a synchronized state. Using two dedicated TCP/IP communication ports and a heartbeat, the primary and the standby databases track where they are processing currently, the current state of replication, and whether the standby database is up-to-date with the status of the primary database. When a log record is "closed" (still in memory, but has yet to be written to disk on the primary), it is immediately transmitted to the HADR standby database(s). Transmission of the logs to the standbys may also be time-delayed.

### Multiple standby

Beginning in Db2 v10.1, the HADR feature supports multiple standby databases. This enables an advanced topology where you can deploy HADR in multiple standby mode with up to three standby databases for a single primary. One of the databases is designated as the principal HADR standby database, with the others termed as auxiliary HADR standby databases. As with the standard HADR deployment, both types of HADR standbys are synchronized with the HADR primary database through a direct TCP/IP connection. Furthermore, both types support the reads on standby feature and can be configured for time-delayed log replay. It is possible to issue a forced or unforced takeover on any standby, including the delphix auxiliary standby. However, you should never use the Delphix auxiliary standby as a primary, because this will impact Delphix performance.

### Delphix HADR synchronization

The Delphix for Db2 uses the HADR capability of Db2 to synchronize data from a production Db2 database into a Delphix-controlled Db2 "standby" server. By using this mature and existing Db2 capability, the Delphix Engine is able to ingest data and keep the standby server in sync with only a minimal impact on production. The HADR connection is configured to Super-Asynchronous (SUPERASYNC) mode where log writes are considered successfully transmitted when the log records are sent from the primary database. Because the primary database does not wait for acknowledgments from the standby database, there is no delay on the primary and transactions are considered committed regardless of the state of the replication of that transaction. For further information on Delphix synchronization, see [Linking a dSource from a Db2 Database: An Overview](#)

### Database partitioning feature

Database Partitioning Feature (DPF) lets you partition your database across multiple servers. Since you can add new machines and spread your database across them, this allows users to scale their database. This means more CPUs, more memory, and more disks from each of the additional machines are available for your database. DPF can be used to manage large databases for a variety of use cases including data warehousing, data mining, online analytical processing (OLAP), or online transaction processing (OLTP) workloads.

DPF enables the user to divide a database into database partitions, a database partition is a part of a database that consists of its own data, indexes, configuration files, and transaction logs. Each database partition can be configured on the different physical server having its own set of computing resources, including CPU and storage. When a query is processed, the request is divided so each database partition processes the rows that it is responsible for. DPF can maintain consistent query performance as the table grows by providing the capability to add more processing power in the form of additional database partitions. This capability is often referred to as providing linear scalability using Db2s shared-nothing architecture.

DPF is an approach to sizing and configuring an entire database system. Please follow the recommended practices for optimal performance, reliability, and capacity growth. Please refer to IBM documentation of DPF for more details in [IBM knowledge center](#)

## Delphix architecture with Db2

This topic describes the high-level process for adding Db2 environments, linking Db2 instances to the Delphix Engine, and provisioning virtual databases.

Delphix uses a Standby server called “Staging” to support the data ingestion process. There are multiple benefits of having a Staging server between the Db2 Source Instances and the Delphix Dynamic Data Platform:

- Allows the database instances to stay in sync with the source database, so end users can create or update their virtual databases as needed. The Delphix Engine snapshots the Staging server and the snapshots can be provisioned out to one or more target servers.
- Supports multiple ways of ingesting data, via HADR, Backups, Archive Logs, and Staging Push.
- In the case of the Staging Push feature, the user will control the restore and roll forward of the staging database.
- Prevents the end-users and their related processes to be connected to the primary database instances, making the architecture more secure and reducing primary databases' potential point of failure and performance degradation.
- In the case of Database Partitioning Feature (DPF), the staging and target environments will be single-node environments and all the portions on the source (logical and physical) will be converted to logical partitions on a single host.

## Database partitioning feature architecture

**⚠** The snapshot and provision process occurs on the instance level; all databases that exist on the standby server will be provisioned out to the target machines. Similarly, actions such as bookmark, rewind, and refresh will simultaneously apply to all the databases in the instance.

## Db2 plugin installation and upgrade

The Db2 plugin is provided as a zip file on the Delphix download site. Follow the steps below to download the plugin.

1. In the web browser, go to the Delphix [download](#) site.
2. Login to the download site using email and password credentials.
3. Navigate to the required version number of Delphix Engine.
4. Go to the Plugins > Db2 > Plugin\_<version\_number>.zip folder and download the zip file.

For initial installation and upgrading to a higher version refer to the section [Delphix Engine Plugin Management](#) for further details. For upgrading the Lua-based plugin to the vSDK plugin, refer to the following section.

## Upgrading the Lua-based plugin to the vSDK-based plugin

The steps to upgrade from the Lua-based plugin to the new vSDK-based plugin are described below.

### Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Datasets**.
4. You need to disable all the datasets in the Lua environment before upgrading. Click the dSource you want to disable.
5. From the **Actions** menu (...) select **Disable**.
6. Repeat the above step to disable all the VDB datasets.
7. Select **Manage > Plugins**.
8. To upload a vSDK Plugin, click the  icon. This opens the Upload or Upgrade a Plugin dialog. Upload the <file\_name>.json vSDK plugin.
- 9.

### Upload or Upgrade a Plugin

Upload a plugin file to add new plugins in this engine or to upgrade an existing one. Only JSON formatted text files may be uploaded.

Click to browse  
– OR –  
Drag and drop a file here

#### Upload Status

File not selected

Close

To start using the plugin, refresh target and source environments to re-discover repositories. You will notice the changes in the toolkit directory structure as compared to the Lua plugin environment. This plugin upgrade operation will read the `advanceConfFlag.conf` and `plugin-logging.properties` files present in the Lua plugin environment and combines them to create `db2_plugin.conf`. This operation also creates the `plugin_3.x_archives` directory and moves all the Lua-specific files such as the logs directory, the code directory, and the configuration files (`advanceConfFlag.conf` and `plugin-logging.properties`) into this directory. The plugin archive directory is for reference purposes only. You can delete the same if not required.

10. Click **Manage**.
11. Select **Datasets**.
12. From the **Actions** menu (...) select **Enable**. This will enable the existing datasets under the new vSDK environment.
13. The upgrade is now complete. You can now check the logs for upgrade-related information.

## How to use dlpx\_db\_exec privilege elevation script

The following section describes how the Db2 Plugin works with a Kerberos environment. Customers use principal (A user in Kerberos is called a principal ) to connect with DE. All operations where Plugin needs to execute commands using database users, in that case, privilege elevation script will be used.

The following example shows how the Db2 Plugin works in the Kerberos enabled environment for a customer:

1. All SSH connections to remote hosts use a single environment user that is principal in the case of a Kerberos environment.
2. All Db2 commands which need to be executed using a particular OS user (in the case of DB2 it'll be an instance user) will pass through a privilege elevation script. Commands requiring privilege elevation will be executed under a script dlpx\_db\_exec, with the first parameter being the user to execute as, and the remaining parameters being the command to execute. This script may be customized by the customer, but it must always return the results of the executed command and exit with the return code from the executed command.
3. When a command is invoked with dlpx\_db\_exec then we'll pass the instance IDs which was discovered during the discovery phase.

## Implementation

1. The customer will specify the same primary environment user for the execution of all Delphix object requests.
2. All SSH connections will then be made with this user.
3. A new utility dlpx\_db\_exec has been added to the Plugin.
  - a. The first param to this command will be the db2 instance user to execute the remaining args.
  - b. This script will be customizable by the customer to use their internal utility or command to essentially sudo to the requested instance user.
4. The Db2 Plugin is updated to pass the instance ID string to the dlpx\_db\_exec script such that the customer can update this to use sudo (or some other custom elevation utility).
5. The Db2 Plugin scripts are updated to prefix all commands required to be executed as the instance ID with dlpx\_db\_exec.
6. All Db2 changes are based on top of the Db2 DB level changes.

Sample content of dlpx\_db\_exec script

```
#
# This script allows customization of command execution with an alternate user
# account.
# Arg $1 contains "-u<optional user account>" for the desired user under
# which database commands will be executed.
# By default this argument is ignored and the script is executed as the default
# account.
#
```

```
if [[ $1 != -u* ]]; then

    echo "Incorrect command line parameters, -u<optional user account> is required as
the first parameter"

    exit 1

fi

user_id=`echo $1 | sed -e "s/^-u//"`

echo "$user_id" >> /tmp/test.log

shift 1

echo "$user_id and $DB2_DB_NAME" >> /tmp/test.log

if [[ $user_id != "delphix_os" ]]; then

command=$(printf "%s " "$@" )

sudo su - $user_id -c "cd /home/delphix_os;export DB2DBDFT=$DB2DBDFT;$command"

else

$@

fi
```

## Quick start guide for Db2

This quick start guide, which is excerpted from the larger User Guide, is intended to provide you with a quick overview of working with DB2 database objects in the Delphix Engine. It does not cover any advanced configuration options or best practices, which can have a significant impact on performance. It assumes that you are working in a Lab/Dev setting and attempting to quickly test Delphix functionality. It assumes you will use the VMware Hypervisor.

### Overview

In this guide, we will walk through deploying a Delphix Engine, starting with configuring Source and Target database environments. We will then create a dSource, and provision a VDB.

For purposes of the QuickStart, you can ignore any references to Replication or Masking.

### Deploy OVA on VMware

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

1. Download the OVA file from <https://download.delphix.com>. You will need a support login from your sales team or a welcome letter.
  - a. Navigate to the Delphix Product Releases/<Current Version>/Appliance Images page.
2. Login using the vSphere client to the vSphere server (or vCenter Server) where you want to install the Delphix Engine.
3. In the vSphere Client, click **File**.
4. Select **Deploy OVA Template**.
5. Browse to the OVA file.
6. Click **Next**.
7. Select a **hostname** for the Delphix Engine.  
This hostname will also be used in configuring the Delphix Engine network.
8. Select the **data center** where the Delphix Engine will be located.
9. Select the **cluster** and the **ESX host**.
10. Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
11. Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
12. Select the **virtual network** you want to use.  
If using multiple physical NICs for link aggregation, you must use vSphere NIC teaming. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal Network Architecture for the Delphix Engine](#)
13. Click **Finish**.  
The installation will begin and the Delphix Engine will be created in the location you specified.
14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting Up Network Access to the Delphix Engine](#)

**i** If your source database is 4 TB, you probably need 4 TB of storage for the Delphix Engine. Add at least 4 data disks of similar size for the Delphix VM. For example: for a source database of 4 TB, create 4 VMDKs of 1 TB each.

**i** For a full list of requirements and best practice recommendations, see [Virtual Machine Requirements for VMware Platform](#)

## Setup network access to the Delphix engine

1. Power on the Delphix Engine and open the Console.
2. Wait for the Delphix Management Service and Delphix Boot Service to come online. This might take up to 10 minutes during the first boot. Wait for the large orange box to turn green.
3. Press any key to access the sysadmin console.
4. Enter `sysadmin@SYSTEM` for the username and `sysadmin` for the password.
5. You will be presented with a description of available network settings and instructions for editing.

### Delphix Engine Network Setup

To access the system setup through the browser, the system must first be configured **for** networking in your environment. From here, you can configure the primary **interface**, DNS, hostname, and **default** route. When DHCP is configured, all other properties are derived from DHCP settings.

To see the current settings, run `"get."` To change a property, run `"set =."` To commit your changes, run `"commit."` To exit **this** setup and **return** to the standard CLI, run `"discard."`

```

    defaultRoute    IP address of the gateway for the default route -- for
example, "1.2.3.4."

    dhcp            Boolean value indicating whether DHCP should be used for
the primary interface. Setting this value
                    to "true" will cause all other properties (address,
hostname, and DNS) to be derived from the DHCP
                    response

    dnsDomain       DNS Domain -- for example, "delphix.com"

    dnsServers      DNS server(s) as a list of IP addresses -- for example,
"1.2.3.4,5.6.7.8."

    hostname        Canonical system hostname, used in alert and other logs --
for example, "myserver"

    primaryAddress  Static address for the primary interface in CIDR notation
-- for example, "1.2.3.4/22"

```

Current settings:

```

defaultRoute: 192.168.1.1
dhcp: false
dnsDomain: example.com

```

```
dnsServers: 192.168.1.1
hostname: Delphix
primaryAddress: 192.168.1.100/24
```

- Configure the `hostname` . If you are using DHCP, you can skip this step.

```
delphix network setup update *> set hostname=<hostname>
```

warning: Use the same `hostname` you entered during the server installation.

- Configure DNS. If you are using DHCP, you can skip this step.

```
delphix network setup update *> set dnsDomain=<domain>
delphix network setup update *> set dnsServers=<server1-ip>[,<server2-ip>,...]
```

- Configure either a static or DHCP address.  
DHCP Configuration

```
delphix network setup update *> set dhcp=true
```

Static Configuration

```
delphix network setup update *> set dhcp=false
delphix network setup update *> set primaryAddress=<address>/<prefix-len>
```

The static IP address must be specified in CIDR notation (for example, `192.168.1.2/24` )

- Configure a default gateway. If you are using DHCP, you can skip this step.

```
delphix network setup update *> set defaultRoute=<gateway-ip>
```

- Commit your changes. Note that you can use the `get` command prior to committing to verify your desired configuration.

```
delphix network setup update *> commit
Successfully committed network settings. Further setup can be done through the browser at:
```

```
http://<address>
```

Type `"exit"` to disconnect, or any other commands to `continue` using the CLI.

- Check that you can now access the Delphix Engine through a Web browser by navigating to the displayed IP address, or hostname if using DNS.
- Exit setup.  
delphix> exit

## Setting up the Delphix engine

The setup procedure uses a wizard process to take you through a set of configuration screens:

- Administrators
- Time
- Network
- Network Security
- Storage
- Outbound Connectivity
- Authentication
- Network Authorization
- Registration
- Summary

1. Connect to the Delphix Engine at `http://<Delphix Engine>/login/index.html#serverSetup`.

The **Delphix Setup** application will launch when you connect to the server.

Enter your **sysadmin** login credentials, which initially defaults to the username **sysadmin**, with the initial default password of **sysadmin**. On first login, you will be prompted to change the initial default password.

2. Click **Next**.

### Administrators

The Delphix Engine supports two types of administrators:

- System Administrator (sysadmin) - this is the engine system administrator. The sysadmin password is defined here.
- Engine Administrator (admin) - this is typically a DBA who will administer all the data managed by the engine.

On the Administrators tab, you set up the sysadmin password by entering an email address and password. The details for the admin are displayed for reference.

 The default domain user created on Delphix Engines is now **admin** instead of `delphix_admin`. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling `delphix_admin`.

### System time

The engine time is used as the baseline for setting policies that coordinate between virtual databases and external applications.

Choose your option to set up system time in this section.

For a Quick Start, simply set the time and your timezone. You can change this later.

### Network

The initial out-of-the-box network configuration in the OVA file is set to use a single VMXNET3 network adapter.

You have already configured this in the initial configuration. Delphix supports more advanced configurations, but you can enable those later.

## Storage

You should see the data storage VMDKs or RDMs you created during the OVA installation. Click Next to configure these for data storage.

## Serviceability

Choose your options to configure serviceability settings.

For a Quick Start, accept the defaults. You can change this later.

## Authentication

Choose your options to configure authentication services.

For a Quick Start, accept the defaults. You can change this later.

## Registration

If the Delphix Engine has access to the external Internet (either directly or through a web proxy), then you can auto-register the Delphix Engine:

1. Enter your **Support Username** and **Support Password**.
2. Click **Register**.

If external connectivity is not immediately available, you must perform manual registration.

1. Copy the **Delphix Engine registration code** in one of two ways:
  - a. Manually highlight the registration code and copy it to clipboard. Or,
  - b. Click **Copy Registration Code to Clipboard**.
2. Transfer the Delphix Engine's registration code to a workstation with access to the external network Internet. For example, you could e-mail the registration code to an externally accessible e-mail account.
3. On a machine with access to the external Internet, please use your browser to navigate to the Delphix Registration Portal at <http://register.delphix.com>.
4. Login with your Delphix support credentials (username and password).
5. Paste the **Registration Code**.
6. Click **Register**.

 Although your Delphix Engine will work without registration, we strongly recommend that you register each Delphix Engine as part of the setup. Failing to register the Delphix Engine will impact its supportability and security in future versions.

To regenerate the registration code for a Delphix Engine please refer to, [Regenerating the Delphix Engine Registration Code](#). Delphix strongly recommends that you regenerate this code and re-register the engine regularly to maximize the Support Security of the Delphix Engine. Delphix recommends doing this every six months.

## Summary

The final summary tab will enable you to review your configurations for System Time, Network, Storage, Serviceability, and Authentication.

1. Click the **Back** button to go back and to change the configuration for any of these server settings.
2. If you are ready to proceed, then click **Submit**.
3. Click **Yes** to confirm that you want to save the configuration.
4. Click **Setup** to acknowledge the successful configuration.
5. There will be a wait of several minutes as the Delphix Engine completes the configuration.

## Db2 source and target environment requirements

Source Db2 hosts are servers that have Db2 binaries installed and have Db2 instances created on them. The hosts that contain the data that we wish to ingest are referred to as the source environment. Hosts with empty instances (no dbs in instance) are used as either staging or target hosts. This topic describes the requirements for creating connections between the Delphix Engine and Db2 hosts and instances.

### Requirements for Db2 source hosts and instances

Each Db2 Source host must have IBM Db2 installed and at least one instance created on the machine. Depending on the way you intend to ingest data into the Staging server, you will also need to ensure that the following requirements are met:

- For HADR Ingestion: HADR settings for each database to be used with the standby server should be preset before the linking process begins as described in [Linking a Db2 dSource](#)
- For Backup and Log Ingestion, no additional requirements are needed at this point.

### Requirements for Db2 staging and target hosts and instance

- The staging environment that the Delphix Engine uses must have access to an existing full backup of the source database on disk to create the first full copy. Delphix recommends using compressed backups as that will reduce storage needs and speed up ingest. It is recommended to test the integrity of the backup before using it for ingestion. Once this first full backup is available, subsequent refreshes can be accomplished via HADR or Archive Logs.
- The staging and target Db2 instances that you wish to use must already exist on the host. We can use the same instance for the dSource and VDB creation and can also have multiple VDBs on the same instance.
- The available instances on each host can be verified by going to the databases tab for the environment in question.
- Instance level configuration values such as the bufferpool value will need to be managed by the customer independent of Delphix.
- The instances used for staging and target environments must be compatible with the source Db2 instance.

### Requirements for Db2 DPF staging and target hosts and instances

**i** It is highly recommended that the Database Partitioning Feature (DPF) for Db2 staging and target should be configured on separate hosts due to reason that the DPF environment consumes a lot of resources.

- The staging and target hosts should be configured with the same number of logical partition nodes as the source.
- The logical portion configuration should be added in \$HOME/sqllib/db2nodes.cfg file where \$HOME is the home directory of the instance user.
- The hostname to be used should be a fully qualified domain name.
- db2 nodes.cfg file configured for 4 logical partitions should look like:

```
0 <FQDN hostname> 0
1 <FQDN hostname> 1
2 <FQDN hostname> 2
3 <FQDN hostname> 3
```

- Each logical partition should have a corresponding port entry in /etc/services of hosts. In the example below, db2inst1 is the instance the user and port number from 60000 to 60003 are reserved for inter-partition communication.

```
DB2_db2inst1 60000/tcp
DB2_db2inst1_1 60001/tcp
DB2_db2inst1_2 60002/tcp
DB2_db2inst1_END 60003/tcp
```

- Registry variables DB2RSHCMD and DB2COMM should be updated with values as shown below:

```
SSHCMD=$(which ssh)
db2set DB2RSHCMD="$SSHCMD"
db2set DB2COMM=TCPIP
```

- After the environment is configured on staging and target, execute **db2\_all echo hello** on both staging and target servers to add host key in the known\_hosts file. This will also help to check for any ssh issues on these servers.
- The backup files (or log directory if using **Customer Supplied Archive Logs**) should be consistent with the partitions configured on staging.

## Additional environment requirements

- There must be an operating system user (delphix\_os) with these privileges:
  - Ability to login to the staging and target environment via SSH
  - Ability to run mount, umount, mkdir, and rmdir as a super-user. If the staging and target host is an AIX system, permission to run the nfso command as a super-user. See [Sudo Privilege Requirements for Db2 Environments](#) for further explanation of the commands and [Sudo File Configuration Examples for Db2 Environments](#) for examples of the /etc/sudoers file on different Outdent operating systems.
- There must be a directory on the staging and target environment where you can install the Delphix Engine Plugin. For example, /var/opt/delphix/toolkit .
  - The delphix\_os user must own the toolkit path directory (\_\_\_/var/opt/delphix/toolkit).
  - If the delphix\_os user and instance users (responsible for the Delphix Engine operations such as linking and provisioning) are sharing any common group, then the toolkit path directory (\_\_\_/var/opt/delphix/toolkit) must have permissions rwxrwx-- (0770), but you can also use more permissive settings. This allows instance users who are part of the same group as the delphix\_os user's group to be able to create directories inside the toolkit path directory.
  - If the delphix\_os user and instance users (responsible for the Delphix Engine operations such as linking and provisioning) are not sharing any common group, then the toolkit path directory must have -rwxrwxrwx (0777) permissions.
  - The directory should have 1.5GB of available storage: 400MB for the Plugin and 400MB for the set of logs generated by each Db2 instance that runs on the host
  - In Db2 Plugin, plugin directory space will be used as the base location for the mount point
  - When multiple engines access the same host environment, create a separate Db2 plugin directory for each engine that will discover this environment.
- When configuring staging and target environment for multiple partitions (dpf), the `ClientAliveInterval` option must be set to 0 or commented out to prevent the SSH connection from getting severed in the midst of command executions.

- i** For Db2 plugin version 4.0.0 and onwards, follow the steps below to change the toolkit directory.
1. Disable all the datasets related to that environment

2. The instance of the dataset must have the DIR\_CACHE configuration parameter set to No, as shown below.  
*db2 update dbm cfg using DIR\_CACHE NO*
3. Upload the new vSDK-based plugin. The plugin has upgrade logic implemented in it and will upgrade the existing Lua-based plugin.
4. Refresh the environment to allow the plugin to create plugin paths and files under the scratch path.
5. Enable all the datasets and complete the migration process

- The Delphix Engine must be able to initiate an SSH connection to the staging and target environment
- NFS client services must be running on the staging and target environment
- Staging and Target host instances must have the same Db2 instance code page as the production instance. The instance owner must have a compatible value defined in LC\_ALL or LC\_CTYPE for the Db2 code page. Preferably derived from the value of LC\_ALL, LC\_CTYPE, or LANG of the instance owner on the production host.
- The primary environment user should share its primary group with the instance user. For example, if the delphix\_os is the primary environment user which is used for environment addition and its primary group is also delphix\_os then instance users (responsible for the Delphix Engine operations such as linking and provisioning) should share group delphix\_os as their secondary group.

## Custom configurations in Db2 plugin

### DB2 plugin v3.x

The advanced config file is named **advanceConfFlag.conf** and is created under the during discovery or environment refresh operation if the file does not pre-exist already. This file will have the following configurable parameters:

- **Common Group (*notCommonGroupFlag*):**
  - This parameter sets the permission of "mnts", "logs" and "code" directories under the / **db2=""**>location.
  - Set ***notCommonGroupFlag*** to false, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance user.
  - Set ***notCommonGroupFlag*** to true, if the primary environment user and the instance user do not share any user group.
  - Once the necessary changes are made, refresh the environment in order to apply the changes.

By default, the ***notCommonGroupFlag*** parameter is commented out in the file. This means that the plugin implicitly assumes its value as false. The valid values for this parameter are true or false.

- **Allow Source Database on Same Instance (*allowSourceDBonSameInst*)**

By default, the DB2 Plugin restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database

For example:

- When provisioning a VDB from a VDB then the latter is treated as the source database.
- When provisioning a VDB from a dSource then the staging database representing the dSource is treated as the source database.

Set ***allowSourceDBonSameInst*** to true, if the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database. The valid values for this parameter are true or false.

- **Restore Pipeline limit (*restorePipelineLimit*):**

Db2 DPF Plugin performs restoration of all non-catalog partitions in parallel.

The parameter ***restorePipelineLimit*** allows the user to configure the number of partitions that could be restored in parallel by the plugin. When the new **advanceConfFlag.conf** file is created during environment

refresh or discovery operation, the default value of **restorePipelineLimit** is set to 10. The user can modify the value of this parameter to a desired value. The valid value for this field is any positive integer.

A default config file created during discovery or environment refresh operation:

```
# If the user is not sharing a common group between primary environment user and
instance user.

# Then the user needs to set parameter notCommonGroupFlag as true.

# notCommonGroupFlag=true

# During provision operation check if instance contains a database name which is
identical to the source DB name used for provisioning operation.

# By default plugin will never allow creating a VDB on the instance where source
database (or other database which is identical in name with source DB) already
exists.

# If the user still wants to create a VDB on the instance which contains a database
name which is identical to the source DB name used for provisioning operation,

# then the user needs to set parameter allowSourceDBonSameInst as true.

# allowSourceDBonSameInst=true

# Limit for parallel restores

restorePipelineLimit=10
```

DB2 plugin v4.x and onwards

DB2 plugin config file is named **db2\_plugin.conf** and is created under the >> directory during discovery or environment refresh operation if the file does not already exist. This file has two sections represented by the headers - plugin\_custom\_parameters and plugin\_logging\_parameters.

 It is important for the users to maintain two section headers in the db2\_plugin.conf file. If any of the sections get deleted, the plugin will pick the default value for the parameters under the deleted section.

Plugin custom parameters

#### **Common group (usersHaveCommonGroup)**

- This parameter sets the permission for the "mnts" directory located under the **/db2="">**directory and for the "logs" directory located under the **<delphix\_common> plugin/db2\_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/=""></delphix\_common>>**directory.
- Set the **usersHaveCommonGroup** parameter as **True**, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance user.
- Set the **usersHaveCommonGroup** parameter as **False**, if the primary environment user and the instance user do not share any user group.
- Once the necessary changes are made, refresh the environment in order to apply the changes.

By default, the **usersHaveCommonGroup** parameter is set to **True**. The valid values for this parameter are true or false.

#### **Allow source database on same instance (*allowSourceDbOnSameInstance*)**

By default, the DB2 Plugin restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database

For example:

- When provisioning a VDB from a VDB then the latter is treated as the source database.
- When provisioning a VDB from a dSource then the staging database representing the dSource is treated as the source database.

If the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database, then the parameter **allowSourceDbOnSameInstance** must be set to true. The valid values for this parameter are true or false.

#### **Restore pipeline limit (*restorePipelineLimit*)**

Db2 DPF Plugin performs restoration of all non-catalog partitions in parallel.

The parameter **restorePipelineLimit** allows the user to configure the number of partitions that could be restored in parallel by the plugin. When the new **advanceConfFlag.conf** file is created during environment refresh or discovery operation, the default value of **restorePipelineLimit** is set to 10. The user can modify the value of this parameter to the desired value. The valid value for this field is any positive integer.

#### **Plugin logging parameters**

This feature provides three options to configure and control enhanced logging by the plugin:

1. To set debug log levels.
2. To set active log file size.
3. To set log retention levels.

Delphix users can modify the above parameters defined under the `plugin_logging_parameters` section of this file.

#### **Setting log levels (level)**

Delphix users can set the logging level of the plugin-generated logs by setting the parameter **level** under the `plugin_logging_parameters` header. Higher logging levels will help to expedite debugging issues. There are two levels of logging which are: Info and Debug. The configured logging level will apply to all the objects (both dSources and VDBs) present on a staging/target host. For example; if we have 4 dSources on a host associated with a Delphix Engine then the log level will apply to all the dSources.

#### **Log level description:**

- level=INFO: This level will print only informational logs. This is the default log level.
- level=DEBUG: This level will print informational logs and debug statements.

#### **Setting maximum size of active log file (*logFileSize*)**

Delphix users can set the maximum size of the active log file by defining the value of the `logFileSize` parameter under the `plugin_logging_parameters` header of the `db2_plugin.conf` file. Once this maximum size limit is reached, the plugin will rotate the log as per the retention property described below. This parameter only takes in a positive integer value. The minimum value of this parameter is 1 MB and the maximum value is 10 MB. The default value is 1 MB.

#### **Setting log retention levels (*retention*)**

Delphix users can set a retention level for plugin-generated logs for each dataset (.diag.log)="" using="" the="" parameter="">**retention** under the plugin\_logging\_parameters header. As per this parameter, the log files are moved (archived), renamed or deleted once they reach the value set in the logFileSize parameter. New incoming log data is directed into a new fresh file (at the same location).

By default, the value for this parameter will be set to a minimum value of 2. The user can change this value and set its value within the range 2 and 50. For example; if retention is set to 4, the plugin will have the following log files: <DB Name>.diag.log, <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB Name>.diag.log.4.

- File <DB Name>.diag.log is the active log file
- File <DB Name>.diag.log.1 is the most recent archive log file
- File <DB Name>.diag.log.4 is the oldest one

 The DB2 plugin will ignore values for a parameter if the values do not fit the description above and will continue the operation with the default set of values for that particular parameter.

#### db2\_plugin.conf

```
#
# The parameters must not be left padded with spaces. The plugin will otherwise not
# accept the specified parameter
# values and will use the default values.
#

[plugin_custom_parameters]
#
# If the user has not shared a common group between primary environment user and
# instance user.
# Then the user needs to set parameter usersHaveCommonGroup as False.
#

usersHaveCommonGroup=True

#
# During provision operations the plugin checks if the target instance contains a
# database name which is identical to
# the source DB name from which the VDB is to be created. By default the plugin will
# never allow creating a VDB on the
# instance where the source database already exists, or on any instance that has a
# database with the same name. If the
# users still want to create a VDB on an instance which contains a database with the
# same name as the source DB then
# they need to set parameter allowSourceDbOnSameInstance as True.
#

allowSourceDbOnSameInstance=False

#
# If the users want to control the number of parallel restores then they can tune the
# parameter restorePipelineLimit.
# By default the value of this parameter would be 10.
#
```

```

restorePipelineLimit=10

[plugin_logging_parameters]
#
# This flag will set the debug level of plugin logs on the remote server (both
# staging and target). There are two levels:
# Info
# Debug
# The above are the only valid values that can be assigned. If any other value is
# assigned, the plugin will set the
# default level as Info. the string is case insensitive so info, Info and INFO are
# acceptable.
#
level=INFO

#
# This parameter will set the maximum size of the active log file in MB. Once this
# limit is reached, the plugin will
# rotate the log as per the retention property defined below. The minimum value of
# this parameter is 1 MB and maximum
# value is 10 MB. This parameter only takes in a positive integer value. The default
# value is 1 MB
# logFileSize=<positive integer>
#
logFileSize=1

#
# Whenever the size of <DB Name>.diag.log file exceeds the value provided by
# logFileSize parameter then the plugin will
# rename the active log file to <DB Name>.diag.log.<number> and a new log file with
# name <DB Name>.diag.log will be
# generated. For example, if LogRetention is set to 4, the plugin will have the
# following log files: <DB Name>.diag.log,
# <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB
# Name>.diag.log.4.
# File <DB Name>.diag.log.4 will be the oldest one.
# File <DB Name>.diag.log.1 will be the most recent archive log file.
# File <DB Name>.diag.log will be the active log file.
# The minimum and default value for retention flag is 2.
# retention=<positive integer>
#
retention=2

```

## Instance user requirements

- The instance owner of each instance you wish to use within staging or a target host must be added as an environment user within the Delphix engine. See [Managing Db2 Users and Instance Owners](#)

- For HADR synced dSources the staging instance owner must be able to "read" the ingested database contents as Delphix will check the validity of the database by querying tables before each dSource snapshot. warning : If a container is added or deleted, the dSource will have to be resynced.
- Ensure that the following database configurations are set to default values:
  - LOGPRIMARY, LOGSECOND - default values are set by DB2 configuration advisor and shouldn't be changed. For more info, see [logsecond - Number of secondary log files configuration parameter](#)
  - LOGARCHCOMPR1, LOGARCHCOMPR2- the default values are set to OFF so that the workflows can work properly.

### Database container requirements

- All Db2 database container types are fully supported with the exception of Db2 raw containers.
- It is recommended not to use special characters for source database container paths as this may create problems while parsing such container paths and may also result in failures during dSource and VDB creation.

### Sudo privilege requirements for Db2 environments

This topic describes the rationale behind specific `sudo` privilege requirements for virtualizing Db2 Databases.

Privilege	Sources	Targets and staging	Rationale
<code>mkdir/</code> <code>rmdir</code>	Not Required	<b>Required</b>	Delphix dynamically makes and removes directories under the provisioning directory during VDB operations. This privilege is optional, provided the provisioning directory permissions allow the delphix os user to make and remove directories.
<code>mount/</code> <code>umount</code>	Not Required	<b>Required</b>	Delphix dynamically mounts and unmounts directories under the provisioning directory during VDB operations. This privilege is required because <code>mount</code> and <code>umount</code> are typically reserved for superuser.

 It is required to specify the NOPASSWD qualifier within the "sudo" configuration file, as shown here: [Sudo File Configuration Examples for Db2 Environments](#). This ensures that the "sudo" command does not demand the entry of a password, even for the "display permissions" (i.e. "sudo -l") command. Delphix issues "sudo -l" in some scripts to detect if the operating system user has the correct sudo privileges. If it is unable to execute this command, some actions may fail and Delphix will raise an alert suggesting it does not have the correct sudo permissions. Restricting the execution of "sudo -l" by setting "listpw=always" in the "/etc/sudoers" file when the Delphix operating system user is configured to use

public key authentication will cause the Delphix operating system user to be prompted for a password which will fail certain Delphix actions. Use a less restrictive setting for listpw than "always" when the Delphix operating system user is using public-key authentication.

## Adding a Db2 environment

### Prerequisites

- Make sure that the staging environment in question meets the requirements described in [Requirements for Db2 Hosts and Databases](#)

### Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Next to **Environments**, click the **Actions (...)** menu and select **Add Environment**.
5. In the Add Environment dialog, select **Unix/Linux** in the menu.
6. Select **Standalone Host**.
7. Click **Next**.
8. Enter a **Name** for the environment. Enter the **Host IP address** or **hostname**.
9. Enter the **SSH port**.  
The default value is 22.
10. Enter an **OS Username** for the environment.  
For more information about the environment user requirements, see [Requirements for Db2 Hosts and Databases](#)
11. Select Login Type.
  - Username and Password - enter the OS username and password
  - Username and Public Key - enter the OS username.
  - Password Vault - select from an existing Enterprise Password Vault  
warning : Currently, the Enterprise Password Vault option is not supported.  
Using Public Key Authentication  
If you want to use public-key authentication for logging into your Unix-based environment, there are two options: use the engine's key pair or provide a key pair for this environment.  
To use the engine's key pair:
    - a. Select **Public Key** for the **Login Type**.
    - b. Click **View Public Key**.
    - c. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you will need to create it.
      - i. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by the user).
      - ii. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
      - iii. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.

As an alternative, you can provide a key pair specific for this environment via the API or CLI. See [Option 2 in this CLI Cookbook article](#) for instructions.
12. For Password, enter the password associated with the user in step 11.
13. Using Public-Key Authentication:
  - a. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write privileges to it (make sure the file is owned by the user).

- b. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
  - c. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.
14. You can also add public key authentication to an environment user's profile by using the command-line interface, as explained in the topic [CLI Cookbook: Setting Up SSH Key Authentication for UNIX Environment Users](#)
15. For Password Login, click Verify Credentials to test the username and password.
16. Enter a **Toolkit Path** (make sure the toolkit path does not have spaces).  
For more information about the toolkit directory requirements, see [Requirements for Db2 Hosts and Databases](#)
17. To provide your own Oracle Java select the **Provide my own JDK** checkbox and click **Next**.
18. In the Java Development Kit tab enter the absolute path to your Oracle JDK and click **Next**.
19. Click **Submit**.

As the new environment is added, you will see two jobs running in the Delphix platform Job History, one to Create and Discover an environment, and another to Create an environment. When the jobs are complete, you will see the new environment added to the list in the Environments tab. If you do not see it, click the Refresh icon in your browser.

### Managing DB instances

When you add an environment with the Delphix Management Application, all existing DB2 instances on the host are automatically discovered by Delphix. A list of all instances and databases are available to Delphix based on the environment discovery process.

### View instances

1. Log in to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. In the Environments panel, click on the **name of the environment** you want to refresh.
5. Select the **Databases** tab to see a list of all DB2 instances found in the environment.

### Linking a data source (dSource)

#### Prerequisites

- Be sure that the source and staging instances meet the host requirements and the databases meet the container requirements described in [Requirements for Db2 Hosts and Databases](#)

#### Source database preparation

- **Instance owner permissions**  
Delphix uses the Db2 instance owner account on the dSource for multiple operations, including verifying the data inside the databases. In order to ingest a database on the staging server with different instances, we need permissions on the source database in order to perform a restore on the staging server. As an example, if we have an instance named "auto1051" at the source with a database name "delphix" and we want to create a dSource on the "auto1052" instance on the staging server, then you must explicitly grant DBADM and SECADM to the dSource instance "auto1052" on the source instance using the following steps:
  - a. Connect to the source database as the source instance owner.
    - i. `connect to <DB_NAME> user <SOURCE_INSTANCE_OWNER>`
  - b. Issue database grant command
    - i. `grant DBADM, SECADM on the database to user <DSOURCE_INSTANCE_OWNER>`
    - ii. `grant DBADM, SECADM on the database to user <VDB_INSTANCE_OWNER>`

- c. Repeat step 2 for every database to be included in the dSource, on the corresponding source database.

Determine if your dSource will be a non-HADR instance, a HADR single standby instance, or a HADR multiple standby instance. Non-HADR dSources can only be updated via a full dSource resync from a newer backup file

#### Non-HADR Database

1. See the "InstanceOwner Permissions" section above.
2. Ensure that the source database has the necessary user permissions for the provisioned VDBs as described in [Database Permissions for Provisioned Db2 VDBs](#)

#### HADR single standby database

1. All items in Non-HADR Database section above.
2. The following database configuration settings must be set:
  - a. *update db cfg for <DB\_NAME> using HADR\_LOCAL\_HOST <PRIMARY\_IP> HADR\_LOCAL\_SVC <PRIMARY\_PORT> immediate*
  - b. *update db cfg for <DB\_NAME> using HADR\_REMOTE\_HOST <STANDBY\_IP> HADR\_REMOTE\_SVC <STANDBY\_PORT> immediate*
  - c. *update db cfg for <DB\_NAME> using HADR\_REMOTE\_INST <STANDBY\_INSTANCE\_NAME> immediate*
  - d. *update db cfg for <DB\_NAME> using HADR\_SYNCMODE SUPERASYNC immediate*
3. If database configuration parameter LOGINDEXBUILD is set to OFF, do the following:
  - a. *update db cfg for <DB\_NAME> using LOGINDEXBUILD ON*
  - b. Force off all connections to the database and reactivate the database
4. If database configuration parameter LOGARCHMETH1 is set to OFF, do the following:
  - a. *update db cfg for <DB\_NAME> using LOGARCHMETH1 XXXX (must be a valid log archiving method)*
  - b. Take an offline backup
5. If LOGARCHMETH1 points to a third-party backup server (i.e. TSM or Netbackup) define LOGARCHMETH2 to disk
  - a. *update db cfg for <DB\_NAME> using LOGARCHMETH2 DISK:<full path to archive log directory>*
    - i. Log files in the directory must be available from the time of the backup until the restore has successfully completed on the dSource.
6. *db2 start hadr on db <DB\_NAME> as primary by force*
7. Take a full online backup as defined in the "Backup Source Database" section below.
8. Record the following information, as it must be entered on the Delphix Engine while creating the dSource.
  - a. HADR Primary hostname
  - b. HADR Primary SVC
  - c. HADR Standby SVC (auxiliary standby port)

#### HADR multiple standby databases

This **assumes** a single standby database HADR setup already exists. The existing standby will be referred to as the main standby. The new delphix standby will be referred to as the auxiliary standby.

1. The following database configuration settings must be set on the primary database:
  - a. *update db cfg for <DB\_NAME> using HADR\_SYNCMODE <SYNC MODE> immediate – set whichever sync mode you wish to use on your main standby.*
  - b. *update db cfg for <DB\_NAME> using HADR\_TARGET\_LIST "<MAIN\_STANDBY\_IP:MAIN\_STANDBY\_PORT|AUXILIARY\_STANDBY\_IP:AUXILIARY\_STANDBY\_PORT>" immediate*
    - i. You may have up to two auxiliary standbys defined separated by a '|'; one of which must be the delphix dSource.
2. *stop hadr on db <DB\_NAME>*
3. *sart hadr on db <DB\_NAME> as primary by force*
4. Take a full online backup as defined in the "Backup Source Database" section below. While this backup is running, you may continue with step 5.

5. The following database configuration settings must be set on the existing main standby database:
  - a. *update db cfg for <DB\_NAME> using HADR\_SYNCMODE <same mode as defined in 1.a above.> – It must be the same value used for the primary database.*
  - b. *update db cfg for <DB\_NAME> using HADR\_TARGET\_LIST "<PRIMARY\_IP:PRIMARY\_PORT|MAIN\_STANDBY\_IP:MAIN\_STANDBY\_PORT>"*
6. *stop hadr on db <DB\_NAME>*
7. *start hadr on db <DB\_NAME> as standby*
8. Record the following information, as it must be entered on the Delphix Engine while creating the dSource (the auxiliary standby database):
  - a. HADR Primary hostname
  - b. HADR Primary SVC
  - c. HADR Standby SVC (auxiliary standby port)
  - d. HADR\_TARGET\_LIST <PRIMARY\_IP:PRIMARY\_PORT|MAIN\_STANDBY\_IP:MAIN\_STANDBY\_PORT>

## Delphix recovery with customer supplied archive logs

The Delphix Recovery with Customer Supplied Archive Logs (formerly known as Delphix Backup and Logs ingestion), feature allows users to provide Delphix with the location of the source database archive logs. Full backups only have to be restored during dSource creation, or during RESYNC operations when there are exceptions, for example, lost/corrupt log files. Archived logs get applied during the snapshot operation.

A full backup is required to create a dSource and prior to the snapshot operation, users can provide the archive logs to update the dSource during the snapshot operation, user-provided logs will be applied to the staging database. Applying the logs on a regular basis allows users to keep their dSource in sync with their source database. The staging database will always be in a roll forward pending state. The Plugin performs validation before applying the logs. Plugin managed Pre and Post Hooks can be used for preparing and purging the full backups and archive logs. A list of logs that are available for purging is stored in the snapshot metadata of the dSource. In case DPF is enabled, users need to place archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions, then the user-provided log path will have folder names as NODE0000 and NODE0001. Both these folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

HADR and non-HADR configured dSources can be moved to this feature by performing a RESYNC operation.

Delphix supports Customer Supplied Archive Logs with Db2 version 10.5 and 11.1. To use Customer Supplied Archive Logs simply check the checkbox provided during dSource creation. Customer Supplied Archive Logs require that:

- A full backup must be accessible on the staging server, it could be a shared location but must be mounted on the staging host and visible as a file system.
- Archived logs must also be accessible on the staging server
  - The following command can be used to generate archive logs from the source database;
    - db2 archive log for database <database name>
  - Instance users must have read permissions on logs so that Delphix-managed recover can apply the logs.
  - Instance users must have read permissions on logs and additional write permissions on customer-provided log location if Delphix is planning to use customer-provided log location for applying the logs.
  - If the user has placed the archive logs at a user-provided log location, then the logs must be valid and the first active log of the staging database must be present in the user-provided log location.
- If database configuration parameter LOGINDEXBUILD is set to OFF, do the following:
  - update db cfg for <DB\_NAME> using LOGINDEXBUILD ON
  - Force off all connections to the database and reactivate the database
- The customer does log purging from the provided log location. Delphix only provides the list of logs that are eligible for purging.

**Limitations:**

- Continuous updates to the dSource are not available. The DB\_SYNC operations apply new logs from the log location and keep the dSource updated with changes on the source.
- Read access to the staging database is not available.

**Staging push**

With the "Staging Push" feature, you can now manage the restore and rollforward operations from the CLI. During dSource creation (or RESYNC), the plugin will create an empty mount point and will provide a restore and rollforward template that will allow you to restore the database. You can restore the dSource using the steps mentioned in the readme or through any other method of their choice. You can also configure the dSource with HADR by following the steps provided in the "HADR Single/Multiple Standby Database" sections above.

Once the dSource is ready, you can perform restore and rollforward operations from the CLI. After the restore, the staging database should remain in the rollforward pending state, and prior to the next snapshot, the user can do a rollforward to a specific Point-in-Time (by providing a timestamp to the rollforward command) against the available archive logs. In the case of HADR dSource, you will have to stop HADR before taking a snapshot and starting it back on after the snapshot operation is complete.

 You can create a pre-snapshot and post-snapshot hook to perform HADR stop and start operations on the staging database respectively so that you don't have to connect to the staging host every time a snapshot is captured.

Prior to the snapshot operation, the user should validate the backups and the archive logs before applying them to the staging database. Below are the user side validations:

-  **User side validation prior to snapshot operation**
- The user must validate the backup files using **db2ckbkp** utility on the staging host.
  - The user must validate the archive logs using **db2cklog** utility on the staging host.
  - The authenticity of archive logs would be managed by the user.
  - The user has to provide the first active log at the staging database log directory location after applying the logs.
  - If there is a scenario where a user performed some load copy (non-logged transactions) operations on the source side then it's the responsibility of the user to make those non-logged transactions available on the staging database.

**Backup source database**

 **New feature: Source database with Raw DEVICE type storage**  
Several users use raw device-based tablespaces for source Db2 databases. To leverage these environments with Delphix, Delphix has built a workflow using Db2s native tools that allow Delphix to discover and convert a raw device-based tablespace into an automatic storage-based tablespace during ingestion. Once the data is ingested into staging, customers will be able to provision VDBs of the automatic storage-based database.

In order to complete the linking process, the Standby dSource must have access to a full backup of the source Db2 databases on disk. This should be a compressed online Db2 backup and must be accessible to the dSource instance owner on disk. Delphix is currently not set up to accept Db2 backups taken using third-party sources such as Netbackup or TSM. All three features of data ingestion, namely HADR, Non-HADR, and Customer Supplied Archive Logs backups must also include logs. Starting with the Db2 plugin version 3.1.1, we are also supporting full online

backups, which are taken using the "exclude logs" syntax. This support is only applicable to the dSources created using the Customer Supplied Archive Logs (Backup and Logs) ingestion mechanism on a single partition.

#### **Support for named pipe type DB2 backup**

Users can also provide Db2 backups of type named-pipe. Db2 plugin will check the type (type will be either named-pipe or a file) of backup and will use the restore syntax accordingly.

Example backup command: db2 backup database <DB\_NAME> online compress include logs.

Backup types supported in DPF

The type of backups supported by Db2 plugin when used with DPF are:

- SSV backups through backup files or named pipes.
- Non-SSV backups through backup files or named pipes.

Example backup command for DB2 SSV backups: db2\_all "db2 BACKUP DATABASE<DB\_NAME> ON all dbpartitionnums online to <Backup File Location> compress include logs"

Example backup command for DB2 Non SSV backups: db2\_all "db2 backup database <DB\_NAME> online to <Backup File Location> compress include logs"

#### **Best practices for taking a backup**

The following best practices can help improve backup and restore performance:

1. Compression should be enabled
2. Following parameters should be optimally configured:
  - a. Utility Heap Size (UTIL\_HEAP\_SZ)
  - b. No. of CPUs
  - c. No. of Table Spaces
  - d. Extent Size
  - e. Page Size
3. Parallelism & Buffer configuration may be used to improve backup performance. Parameters that should be configured are:
  - a. Parallelism
  - b. Buffer Size
  - c. No. of Buffers

More information about backup best practices is available in [IBM Knowledge Center](#).

## Procedure

1. Login to the **Delphix Management Application**.
2. On the **Databases** tab of the Environment Management screen, add a source config against the discovered staging instance.
3. Then, click **Manage** and select **Datasets**.
4. Click the **Plus (+)** icon and select **Add dSource**, you'll get a list of available source configs using which you can go for dSource creation.
5. In the **Add dSource** wizard, select the required source configuration. Consider the following when choosing an ingestion method.
  - a. Users can specify their own mount path to host the dSource dataset by specifying the path in the **Mount Base** field.

- b. The restore and rollforward operations on the staging database can be managed by selecting the **“Use Staging Push”** checkbox. If the **“Use Staging Push”** checkbox is selected, the other checkboxes must not be selected.
- c. If you are working with a HADR setup and want to ingest the database on a staging using HADR configurations, you need to check the **Link against source using HADR** checkbox and uncheck the **Customer Supplied Archive Logs** checkboxes. However, if you want to setup a dSource using HADR configurations using Staging Push, you need to only select the **Staging push** checkbox and handle restore and HADR configuration manually.
- d. To use a non-HADR method for database ingestion, you need to uncheck the **Link against the source using HADR** and **Customer Supplied Archive Logs** checkboxes.
- e. To use the **Customer Supplied Archive Logs** method for database ingestion check the **Customer Supplied Archive Logs** checkbox and uncheck the **Link against source using HADR** checkbox and enter the path in **Archive Log Path**.
- f. To use the **Database partition feature** check **Use DPF** checkbox and uncheck the **Link against the source using HADR** checkbox. For more information on DPF please view [IBM Db2 Overview](#)

Add dSource ×

- Preparation
- dSource Type
- Source
- dSource Configuration
- Data Management
- Policies
- Hooks
- Summary

### Source

Select an available environment /data source to connect to your dSource

**Data Source**

Filter: none

- BATMAN  
RHEL 8.2 XLARGE non DPF  
AppData
- R82D115A  
RHEL 8.2 XLARGE non DPF  
AppData

**Data Type**

AppData

Database Name (Required) \*

BATMAN

Database name to restore from.

---

**Mount Base**

Path on the local filesystem where the dSource will be mounted by the Delphix Engine. The new path will take into effect only after executing the disable and enable operations.

---

**Staging Push**

Enabling this option will allow user to manage the staging database themselves. If this option is selected then there is no need to provide backup path and no need to select any other option.

Backup Path

/U01/XLARGE\_BKP/

Location of backup files on the Staging Host. Staging host selection will be required before completing this wizard. Default backup file location is the Instance home directory.

Parallelism factor for Database restore

4

Allows users to provide parallelism factor for db2 to execute the database restore operation with.

---

**DPF (Database partitioning feature)**

Enabling this option will allow creation of a dSource with DPF (Database partitioning feature) configuration

---

**Archive Logs**

Link a database, optionally providing the location of Archive Logs.

---

**Archive Log Path**

Location of Customer Supplied Archive Logs which will be applied to the staging database prior to any snapshot. Path must be present on the Staging Host.

---

**Archive Log Location is READ ONLY**

Allow Delphix to copy archive logs to a temporary location, apply the logs, remove the temporary log above and then snapshot the updated staging database. This strategy may be applicable when archive logs are shared from production over NFS and the preference is to set the share to RO.

---

**Rollforward to PIT**

Rollforward a database to a particular timestamp if archive logs are provided and a valid timestamp is provided along with snapshot parameters.

---

**Link against source using HADR**

Enabling this option will configure the staging host as a HADR Standby.

HADR Primary Hostname

The host name where the primary database resides (required for HADR databases).

---

HADR Primary SVC

HADR Primary SVC port value (required for HADR databases).

---

HADR Standby SVC

HADR Standby SVC port value (required for HADR databases).

---

HADR Target List

HADR Target list 'host:port|host:port|host:port' values (required for HADR with multiple standby databases).

---

**Use Plugin Hooks**

Execute custom scripts when linking a dSource

---

**Plugin Pre-Restore Hook**

Execute custom scripts prior to any recovery operation.

---

**Plugin Post-Restore Hook**

Execute custom scripts following database recovery as a part of linking or resync operations.

---

**Staging Database Configuration Settings**

Customise Staging Database configuration settings. For example DATABASE\_MEMORY, LOGFILSIZ.

+ Add

Cancel Back Next Submit

6. The **database name** is mandatory and must be unique for a given instance. This is the name that the database was on the instance it was restored from.
7. If the user is planning to create a dSource with the "**Staging Push**" feature then the user must need to select the "**Use Staging Push**" checkbox.
8. Enter the complete **Backup Path** where the database backup file resides. If no value is entered, the default value used is the instance home directory. If there are multiple backup files for a non-DPF database on the backup path, the most current one will be used. If there are multiple sets of backup files for a DPF database on the backup path, the most recent one will be used.
9. Optionally, you can add the **Parallelism factor for Database restore** to provide the degree of parallelisation to run the database restore operation. If no value is entered, the Db2 plugin inherently assigns parallelism factor. Info :
  - a. Parallelism factor depends on the resources provided on the staging host, you may not see any difference in performance if there aren't enough resources for Db2 plugin to implement the parallelism.
  - b. You can provide any positive integer value for parallelism factor. Db2 plugin will provide that level of parallelism given that the system has appropriate resources to offer.
  - c. Parallelism factor is inversely proportional to the Database restore time, which implies that a higher parallelism factor will result in reduced restoration time.
  - d. For optimal performance during restoration, make sure to provide the same parallelism factor while creating the backups.
10. If the user wants to roll forward a snapshot to a user-specified timestamp, then the user must select the **Rollforward to PIT** checkbox. Users can also manually do this through the snapshot option.  
Info : The user-specified timestamp needs to be provided along with the timezone. For example, 2021-11-14-04.15.00 **UTC**. If the timezone is not entered, then the user's local timezone is considered.
11. Optionally, users can set the database configuration parameters during the linking operation in the **Config Settings** section.
12. Optionally, users can provide a bash script as a **Plugin** defined hook. Delphix has two Plugin managed Hooks:
  - a. **Plugin Pre-Restore Hook:** The bash script entered in this field will get executed before restoration. This hook is useful in such cases where the users want to prepare the full backup before the restore operation.
  - b. **Plugin Post-Restore Hook:** The bash script entered in this field will get executed after completion of the restore operation. This hook is useful in such cases where the user wants to purge the full backup file after the restore operation.

1. Plugin managed pre-Hook – User can copy the required full backup file from some remote location to staging host. Below is an example of such bash script (name of below script is copyBackup.sh)

```
#!/bin/bash
```

```
# Copying backup file from a remote host remote.delphix.com
scp auto1051@remote.delphix.com:/backuplocation/
R74D105A.0.auto1051.DBPART000.20180510073639.001 /db2backup/
```

The user can provide the above script in Plugin managed pre-Hook field as "sh copyBackup.sh"

2. Plugin managed post-Hook – User can purge the full backup file from the staging host. Below is an example of such bash script (name of below script is purgeBackup.sh)

```
#!/bin/bash
```

```
# Purging full backup file from staging host for saving the staging
storage
rm -f /db2backup/R74D105A.0.auto1051.DBPART000.20180510073639.001
```

The user can provide the above script in Plugin managed post-Hook field as "sh purgeBackup.sh"

13. If the dSource is to use **HADR** please enter the following fields. For more information about HADR please view [Linking a dSource from a Db2 Database: An Overview](#)
  - a. Enter a fully qualified HADR Primary Hostname. This is a required field for HADR and must match the value set for HADR\_LOCAL\_HOST on the master.
  - b. Enter the port or /etc/services name for the HADR Primary SVC. This is a required field for HADR and uses the value set for HADR\_LOCAL\_SVC on the master.
  - c. Enter the port or /etc/services name for the HADR Standby SVC. This is a required field for HADR and uses the value set for HADR\_REMOTE\_SVC on the master.
14. If you are using **Customer Supplied Archive Logs** for dSource creation complete the following fields:
  - a. Check the Customer Supplied Archive logs checkbox
  - b. Provide the log location of the archive logs. In this location, users can load copy files by appending schema and table name to it so that plugin can process those load copy files during log apply process. Archive logs will be used for applying the logs during the snapshot operation. This location must be a part of the staging server and this location must be different than full backup location.

- c. The **Archive Log Location is READ ONLY**( default) option indicates whether Delphix should copy the log files to the dSource’s filesystem prior to the log apply process. If this is not selected the staging database will read the log files directly from the user-provided log location and perform the log apply operation.

warning : Special considerations for Archive Log Location is READ ONLY

If this operation is performed on the source database and user want the Plugin to process the load files place the load copy files in your location and append the schema and table names (for example: <DB Name>.<Number>.<Instance>.DBPART<partNumber>.<Timestamp>.001.<schema name>.<table name>) to the load copy file names

If you do not want to process load copy files via the Plugin place the load copy files in a similar structure as it is on the source or set a DB2 registry parameter DB2LOADREC.

warning : Special consideration during dSource upgrade from older version plugin to Customer Supplied Archive Logs feature enabled plugin

Suppose the user is having a dSource with an older version of the plugin and now wants to upgrade that dSource to **Customer Supplied Archive Logs** feature then the user needs to perform the following steps :

1. Go to the configuration tab of dSource and then click on the custom sub-tab.
2. Click on the edit icon.
3. Check the **Customer Supplied Archive Logs** and **Archive Log Location is READ ONLY** checkbox.
4. Click on submit and then go for RESYNC operation to upgrade the dSource.

- 15. Click **Next**.

- 16. Enter a name and select a group for your dSource.

Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups](#) for more information.

- 17. Click **Next** and set the **Staging Environment** to be the same as the dSource host. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance.

Info : Changing the Environment User

If you need to change or add an environment user for the dSource instance, see [Managing Db2 Users and Instance](#)

warning : Ensure that the Staging environment must be the environment that you have chosen to create the source config.

Select the **User** from the drop-down and set the **SNAPSHOT PARAMETERS** for the dSource snapshot.

- a. Click on the **Timestamp** input field to enter the timestamp at which the snapshot will be taken. The user-specified timestamp needs to be provided along with the timezone in YYYY-MM-DD-

HH.MM.SS format. For example, 2022-03-12-04.15.00**UTC**. If the timezone is not entered, then the user's local timezone is considered.

warning : Providing the timestamp will only work if the user has checked the **Rollforward to PIT** option in step 9 above.

- b. Select **Resynchronize dSource** to resynchronize the dSource. This will force a non-incremental load of data from the source similar to when the dSource was created. This action avoids duplicating storage requirements and maintains a Timeflow history.
18. The Delphix Engine will initiate two jobs to create the dSource: DB\_Link and DB\_Sync. You can monitor these jobs by clicking Active Jobs in the top menu bar, or by selecting System > Event Viewer. When the jobs have completed successfully, the database icon will change to a dSource icon on the Environments > Host > Databases screen, and the dSource will also appear in the list of Datasets under its assigned group. Then, click **Next** and you'll get the Policies section. Set the desired **Snapsync Policy** for the dSource. For more information on policies see [Data Management Settings for Db2 dSources](#)
19. Click **Next** and specify any desired pre- and post-scripts. For details on pre- and post-scripts, refer to [Customizing Db2 Management with Hook Operations](#)
20. Click **Next**. Review the dSource Configuration and Data Management information in the Summary section.
21. Click **Submit**.

#### **The dSource configuration screen**

After you have created a dSource, the **dSource Configuration tab** allows you to view information about it and make modifications to its policies and permissions. In the **Datasets** panel, select the dSource you wish to examine. You can now choose the configuration tab to see information such as the **Source files, Data Management** configuration, and **Hook Operations**.

#### **Purging of archive logs after snapshot operation**

Logs can be purged from your log location after the snapshot operation. The Plugin will preserve the list of logs that are eligible for purging in the snapshot's metadata. The snapshot metadata can be accessed via the Delphix CLI or API.

### Backup Source Database

#### **Source database with Raw DEVICE type storage**

Several users use raw device-based tablespaces for source DB2 databases. To leverage these environments with Delphix, Delphix has built a workflow using Db2's native tools that allow Delphix to discover and convert a raw device-based tablespace into an automatic storage-based tablespace during ingestion. Once the data is ingested into staging, customers will be able to provision VDBs of the automatic storage-based database.

In order to complete the linking process, the Standby dSource must have access to a full backup of the source Db2 databases on disk. This should be a compressed online DB2 backup and must be accessible to the dSource instance owner on disk. Delphix is currently not setup to accept DB2 backups taken using third-party sources such as Netbackup or TSM. All three features of data ingestion, namely HADR, Non-HADR, and Customer Supplied Archive Logs backups must also include logs. Starting with Db2 plugin version 3.1.1, we are also supporting full online backups, which are taken using the "exclude logs" syntax. This support is only applicable to the dSources created using the Customer Supplied Archive Logs (Backup and Logs) ingestion mechanism on a single partition.

Example backup command: db2 backup database <DB\_NAME> online compress include logs

#### **Best practices for taking a backup**

The following best practices can help improve backup and restore performance:

1. Compression should be enabled
2. Following parameters should be optimally configured:
  - a. Utility Heap Size (UTIL\_HEAP\_SZ)
  - b. No. of CPUs
  - c. No. of Table Spaces
  - d. Extent Size
  - e. Page Size
3. Parallelism & Buffer configuration may be used to improve backup performance. Parameters that should be configured are :
  - a. Parallelism
  - b. Buffer Size
  - c. No. of Buffers

More information about backup best practices is available in [IBM Knowledge Center](#).

## Procedure

1. Login to the Delphix Management Application using Delphix Engine credentials or as the owner of the database from which you want to provision the dSource.
2. On the **Databases** tab of Environment Management screen, add a source config against discovered staging instance.
3. Then, click **Manage**.
4. Select **Datasets**.
5. Click the Plus (+) icon and select **Add dSource**, you'll get a list of available source configs using which you can go for dsource creation.
6. In the **Add dSource** wizard, select the required source configuration.
7. If you are working with an HADR setup, please leave the HADR checkbox checked unless you're working with Staging push dSource.
8. The **database name** is mandatory and must be unique for a given instance. This is the name that the database was on the instance it was restored from.
9. Enter the complete **Backup Path** where the database backup file resides. If no value is entered, the default value used is the instance home directory. If there are multiple backup files for a database on the backup path, the most current one will be used.
10. Enter the **Log Archive Method1** you wish to use for the database. If no value is entered, the default value used is [DISK:/mountpoint/dbname/arch](#)
11. Optionally, users can set the database configuration parameters during the linking operation in the **Config Settings** section.
12. If the dSource is to use HADR please enter the following fields. If it will not use HADR skip ahead to step 13. For more information about HADR please view [Linking a dSource from a Db2 Database: An Overview](#)
  - a. Enter a fully qualified HADR Primary Hostname. This is a required field for HADR and must match the value set for HADR\_LOCAL\_HOST on the master.
  - b. Enter the port or /etc/services name for the HADR Primary SVC. This is a required field for HADR and uses the value set for HADR\_LOCAL\_SVC on the master.
  - c. Enter the port or /etc/services name for the HADR Standby SVC. This is a required field for HADR and uses the value set for HADR\_REMOTE\_SVC on the master.
13. Click **Next**.
14. Select a **dSource Name** and **Database Group** for the dSource.
15. Click **Next**.  
You will get Data Management section where you need to specify staging environment and user which will be used for dsource creation.
16. Set the **Staging Environment** to be the same as the dSource host.
17. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance.  
Changing the Environment User

If you need to change or add an environment user for the dSource instance, see [Managing Db2 Users and Instance Owners](#)

18. Then, click **Next** and you'll get the Policies section. Set the desired **Snapsync Policy** for the dSource.
19. Click **Next**.
20. Specify any desired pre- and post-scripts. For details on pre- and post-scripts.
21. Click **Next**.
22. Review the dSource Configuration and Data Management information in the summary section.
23. Click **Submit**.

The Delphix Engine will initiate two jobs to create the dSource: DB\_Link and DB\_Sync. You can monitor these jobs by clicking Active Jobs in the top menu bar, or by selecting System > Event Viewer. When the jobs have completed successfully, the database icon will change to a dSource icon on the Environments > Host > Databases screen, and the dSource will also appear in the list of Datasets under its assigned group.

#### **The dSource configuration screen**

After you have created a dSource, the **dSource Configuration tab** allows you to view information about it and make modifications to its policies and permissions. In the **Datasets** panel, select the dSource you wish to examine. You can now choose the configuration tab to see information such as the **Source files, Data Management** configuration, and **Hook Operations**.

## Provisioning a virtual database (VDB)

### Prerequisites

- You will need to have linked a dSource from a staging instance, as described in [Linking a Db2 dSource](#), or have created a VDB from which you want to provision another VDB
- You should have set up the Db2 target environment with necessary requirements as described in [Requirements for Db2 Hosts and Databases](#)
- Make sure you have the required Instance Owner permissions on the target instance and environment as described in [Managing Db2 Users and Instance Owners](#)
- The method for [Database Permissions for Provisioned Db2 VDBs](#) is decided before the provisioning

 You can take a new snapshot of the dSource by clicking the **Camera** icon on the dSource card. Once the snapshot is complete you can provision a new VDB from it.

#### **Please note while creating a VDB on an instance**

By default, DB2 Plugin will not allow provisioning a VDB on an instance which contains a database that has an identical name to the source database.

For e.g.;

1. When we are provisioning a VDB from a VDB then source VDB will be treated as the source database.
2. When we are provisioning a VDB from a dSource then a staging database will be treated as the source database.

If the user wants to provision a VDB on an instance which contains a source database, then the user needs to follow the below steps :

1. Check if any config file with name **advanceConfFlag.conf** exists at location **<Toolkit directory>/**. If it does not exist, then the user should create a file with name **advanceConfFlag.conf** at location **<Toolkit directory>/**. Instance user must have read permission to this file. Once the file is created, user should proceed to step 2. If the file already exists at this location with the required permission, the user should directly proceed to step 2.
2. Add the below line in this config file.
  - a. `allowSourceDBonSameInst=true`
3. Then create/Refresh the VDB again.

## Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Datasets**.
4. Select a **dSource**.
5. Select a **snapshot** from which you want to provision.
6. Click **Provision VDB** icon to open Provision VDB wizard.
7. Select a target environment from the left pane.
8. Select an **Installation** to use from the dropdown list of available DB2 instances on that environment.
9. Set the **Environment User** to be the Instance Owner. Note: The picking of instance owner is only possible if you have multiple environment users set on that host.
10. Provide VDB Name as database name as parameter.
11. Optionally, set the database configuration parameters for the VDB.
12. Click **Next**.
13. Select a **Target Group** for the VDB.  
Click the green **Plus** icon to add a new group, if necessary.
14. Select a **Snapshot Policy** for the VDB.
15. Click **Next**.
16. Specify any desired hook operations.
17. Click **Next**.
18. Review the **Provisioning Configuration** and **Data Management** information.
19. Click **Submit**.

When provisioning starts, you can review the progress of the job in the **Databases** panel, or in the **Job History** panel of the **Dashboard**. When provisioning is complete, the VDB will be included in the group you designated and listed in the **Databases** panel. If you select the VDB in the Databases panel and click the **Open** icon, you can view its card, which contains information about the database and its Data Management settings.

Once the VDB provisioning has successfully completed, if the source and target instance ids are not the same, you may want to grant secadm and dbadm on the database to the target instance id. Refer to [Database Permissions for Provisioned Db2 VDBs](#) for more information.

## Next steps

Congratulations! You have provisioned your first virtual database!

Now, perform some simple functional tests with your application. You can connect your app to the VDB using standard TNS/JDBC techniques. Delphix has already registered the VDB for you on the target listener.

We suggest the following next steps:

1. Drop a table and use the VDB Rewind feature to test the recovery of your VDB.
2. Take a snapshot of your dSource and refresh your VDB to quickly get fresh production data.
3. Provision a new VDB from your VDB to test sharing data quickly with other teams.

4. Mask your new VDB to protect sensitive data. Provision new VDBs from that masked VDB to quickly provide safe data to development and QA teams.

## Db2 support and requirements

In this section, we will describe all the different Delphix and Db2 components that are part of the Continuous Data solution for IBM Db2 database.

- [Db2 compatibility matrix](#)

- [Sudo file configuration examples for Db2 environments](#)

## Network and connectivity requirements for Db2 environments

### Overview

This topic outlines the network and connectivity requirements for the Delphix Engine and Db2 standby and target environments.

### Port allocations specific to DB2

The Delphix Engine makes use of the following network ports for Db2 standby and target:

#### Inbound to the Delphix engine port allocation

Protocol	Port number	Use
TCP/UDP	111	Remote Procedure Call (RPC) port mapper used for NFSv3 mounts Note: RPC calls in NFSv3 use additional fixed ports for supporting services (lockd, mountd and statd) seen below.
TCP	1110	NFS Server daemon status and NFS server daemon keep-alive (client info)
TCP	2049	NFS Server daemon from vFiles to the Delphix Engine
TCP	54043	NFSv3 mount daemon
TCP	54044	NFSv3 stat daemon (lock state notification service)
TCP	54045	NFSv3 lock daemon/manager
UDP	33434 - 33464	Traceroute from standby and target hosts to the Delphix Engine (optional)

#### Outbound from a standby or target environment port allocation

Protocol	Port numbers	Use
TCP	873	Rsync connections used during V2P.
TCP	8415	DSP connections used for monitoring and script management. Typically DSP runs on port 8415.

## Inbound to a standby or target environment port allocation

Protocol	Port numbers	Use
TCP	22	SSH connections to the target environment

## HADR service ports

The HADR ports set for HADR\_LOCAL\_SVC and HADR\_REMOTE\_SVC on the Db2 Master and Standby hosts. The specific ports used at the customers' discretion and need to be specified during the linking process. It is highly recommended that these ports also be defined in the /etc/services file to ensure that they are only used by Db2 for the specified databases.

## General outbound from the Delphix engine port allocation

Protocol	Port numbers	Use
TCP	25	Connection to a local SMTP server for sending email
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
UDP	162	Sending SNMP TRAP messages to an SNMP Manager
TCP	443	HTTPS connections from the Delphix Engine to the Delphix Support upload server
TCP/UDP	636	Secure connections to an LDAP server
TCP	8415	Connections to a Delphix replication target. See <a href="#">Configuring Replication</a> .
TCP	50001	Connections to source and target environments for network performance tests.

## General inbound to the Delphix engine port allocation

Protocol	Port number	Use
TCP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
UDP	161	Messages from an SNMP Manager to the Delphix Engine

Protocol	Port number	Use
TCP	443	HTTPS connections to the Delphix Management Application
TCP	8415	Delphix Session Protocol connections from all DSP-based network services including Replication, SnapSync for Oracle, V2P, and the Delphix Connector.
TCP	50001	Connections from source and target environments for network performance tests via the Delphix CLI.

Firewalls and intrusion detection systems (IDS)

Production databases on source environments (for dSources) are often separated from the non-production environment by firewalls. Firewalls can add milliseconds to the latency between servers. Accordingly, for best performance, there should be no firewalls between the Delphix Engine and the virtual database (VDB) target environments. If the Delphix Engine is separated from a source environment by a firewall, the firewall must be configured to permit network connections between the Delphix Engine and the source environments for the application protocols (ports) listed above.

Intrusion detection systems (IDSs) should also be made permissive to the Delphix Engine deployment. IDSs should be made aware of the anticipated high volumes of data transfer between dSources and the Delphix Engine.

AppData port requirementsThe use of AppData requires the following ports/protocols.

Two important notes about these specifications:

1. The next release of the Delphix Engine will significantly augment the port/protocol utilization of AppData. The upcoming-only requirements have been marked with a \*.
2. AppData V2P uses RSYNC to export to the target. RSYNC between the target and Delphix Engine is not required for general virtualization usage. The V2P-only requirements have been marked with a ^.

From Source to Delphix Engine	From Delphix Engine to Source	From Target to Delphix Engine	From Delphix Engine to Target
RSYNC (TCP Port 873)	RSYNC (TCP Port 873)	DSP (Default TCP Port 8415)	DSP (Default TCP Port 8415)
DSP (Default TCP Port 8415)	SSH (TCP Port 22)	NFS	SSH (TCP Port 22)
*NFS	DSP (Default TCP Port 8415)	^RSYNC (TCP Port 873)	^RSYNC (TCP Port 873)

## Requirements for Db2 hosts and databases

Source Db2 hosts are servers that have Db2 binaries installed and have Db2 instances created on them. The hosts that contain the data that we wish to ingest are referred to as the source environment. Hosts with empty instances (no dbs in instance) are used as either staging or target hosts. This topic describes the requirements for creating connections between the Delphix Engine and Db2 hosts and instances.

### Requirements for Db2 source hosts and instances

Each Db2 Source host must have IBM Db2 installed and at least one instance created on the machine. Depending on the way you intend to ingest data into the Staging server, you will also need to ensure that the following requirements are met:

- For HADR Ingestion: HADR settings for each database to be used with the standby server should be preset before the linking process begins as described in [Linking a Db2 dSource](#)
- For Backup and Log Ingestion, no additional requirements are needed at this point.

### Requirements for Db2 staging and target hosts and instance

- The staging environment that the Delphix Engine uses must have access to an existing full backup of the source database on disk to create the first full copy. Delphix recommends using compressed backups as that will reduce storage needs and speed up ingest. Once this first full backup is available, subsequent refreshes can be accomplished via HADR or Archive Logs.
- The staging and target Db2 instances that you wish to use must already exist on the host. We can use the same instance for the dSource and VDB creation and can also have multiple VDBs on the same instance.
- The available instances on each host can be verified by going to the databases tab for the environment in question.
- Instance level configuration values such as the bufferpool value will need to be managed by the customer independent of Delphix.
- The instances used for staging and target environments must be compatible with the source Db2 instance.

### Requirements for Db2 DPF staging and target hosts and instances

**i** It is highly recommended that the Database Partitioning Feature (DPF) for Db2 staging and target should be configured on separate hosts due to reason that the DPF environment consumes a lot of resources.

- The staging and target hosts should be configured with the same number of logical partition nodes as the source.
- The logical portion configuration should be added in \$HOME/sqllib/db2nodes.cfg file where \$HOME is the home directory of the instance user.
- The hostname to be used should be a fully qualified domain name.
- db2 nodes.cfg file configured for 4 logical partitions should look like:

```
0 <FQDN hostname> 0
1 <FQDN hostname> 1
2 <FQDN hostname> 2
3 <FQDN hostname> 3
```

- Each logical partition should have a corresponding port entry in /etc/services of hosts. In the example below, db2inst1 is the instance the user and port number from 60000 to 60003 are reserved for inter-partition communication.

```
DB2_db2inst1 60000/tcp
DB2_db2inst1_1 60001/tcp
DB2_db2inst1_2 60002/tcp
DB2_db2inst1_END 60003/tcp
```

- Registry variables DB2RSHCMD and DB2COMM should be updated with values as shown below:

```
SSHCMD=$(which ssh)
db2set DB2RSHCMD="$SSHCMD"
db2set DB2COMM=TCPIP
```

- After the environment is configured on staging and target, execute **db2\_all echo hello** on both staging and target servers to add host key in the known\_hosts file. This will also help to check for any ssh issues on these servers.
- The backup files (or log directory if using **Customer Supplied Archive Logs**) should be consistent with the partitions configured on staging.

#### Additional environment requirements

- There must be an operating system user (delphix\_os) with these privileges:
  - Ability to login to the staging and target environment via SSH
  - Ability to run mount, umount, mkdir, and rmdir as a super-user. If the staging and target host is an AIX system, permission to run the nfso command as a super-user. See [Sudo Privilege Requirements for Db2 Environments](#) for further explanation of the commands and [Sudo File Configuration Examples for Db2 Environments](#) for examples of the /etc/sudoers file on different Outdent operating systems.
- There must be a directory on the staging and target environment where you can install the Delphix Engine Plugin. For example, /var/opt/delphix/toolkit .
  - The delphix\_os user must own the toolkit path directory (\_\_/var/opt/delphix/toolkit).
  - If the delphix\_os user and instance users (responsible for the Delphix Engine operations such as linking and provisioning) are sharing any common group, then the toolkit path directory (\_\_/var/opt/delphix/toolkit) must have permissions rwxrwx-- (0770), but you can also use more permissive settings. This allows instance users who are part of the same group as the delphix\_os user's group to be able to create directories inside the toolkit path directory.
  - If the delphix\_os user and instance users (responsible for the Delphix Engine operations such as linking and provisioning) are not sharing any common group, then the toolkit path directory must have -rwxrwxrwx (0777) permissions.
  - The directory should have 1.5GB of available storage: 400MB for the Plugin and 400MB for the set of logs generated by each Db2 instance that runs on the host
  - In Db2 Plugin, plugin directory space will be used as the base location for the mount point
  - When multiple engines access the same host environment, create a separate Db2 plugin directory for each engine that will discover this environment.
- When configuring staging and target environment for multiple partitions (dpf), the `ClientAliveInterval` option must be set to 0 or commented out to prevent the SSH connection from getting severed in the midst of command executions.

- i** For Db2 plugin version 4.0.0 and onwards, follow the steps below to change the toolkit directory.
1. Disable all the datasets related to that environment

2. The instance of the dataset must have the DIR\_CACHE configuration parameter set to No, as shown below.  
*db2 update dbm cfg using DIR\_CACHE NO*
3. Upload the new vSDK-based plugin. The plugin has upgrade logic implemented in it and will upgrade the existing Lua-based plugin.
4. Refresh the environment to allow the plugin to create plugin paths and files under the scratch path.
5. Enable all the datasets and complete the migration process.

- The Delphix Engine must be able to initiate an SSH connection to the staging and target environment
- NFS client services must be running on the staging and target environment
- Staging and Target host instances must have the same Db2 instance code page as the production instance. The instance owner must have a compatible value defined in LC\_ALL or LC\_CTYPE for the Db2 code page. Preferably derived from the value of LC\_ALL, LC\_CTYPE, or LANG of the instance owner on the production host.
- The primary environment user should share its primary group with the instance user. For example, if the delphix\_os is the primary environment user which is used for environment addition and its primary group is also delphix\_os then instance users (responsible for the Delphix Engine operations such as linking and provisioning) should share group delphix\_os as their secondary group.

#### Custom configurations in Db2 plugin

##### DB2 plugin v3.x

The advanced config file is named **advanceConfFlag.conf** and is created under the **<Toolkit directory>** during discovery or environment refresh operation if the file does not pre-exist already. This file will have the following configurable parameters:

- **Common group (notCommonGroupFlag):**
  - This parameter sets the permission of "mnts", "logs" and "code" directories under the **<Toolkit dir> / db2="">**location.
  - Set **notCommonGroupFlag** to false, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance user.
  - Set **notCommonGroupFlag** to true, if the primary environment user and the instance user do not share any user group.
  - Once the necessary changes are made, refresh the environment in order to apply the changes.

By default, the **notCommonGroupFlag** parameter is commented out in the file. This means that the plugin implicitly assumes its value as false. The valid values for this parameter are true or false.

- **Allow Source Database on Same Instance (allowSourceDBonSameInst)** By default, the DB2 Plugin restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database For example:
  - When provisioning a VDB from a VDB then the latter is treated as the source database.
  - When provisioning a VDB from a dSource then the staging database representing the dSource is treated as the source database.

Set **allowSourceDBonSameInst** to true, if the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database. The valid values for this parameter are true or false.

- Restore Pipeline limit (**restorePipelineLimit**): Db2 DPF Plugin performs restoration of all non-catalog partitions in parallel. The parameter **restorePipelineLimit** allows the user to configure the number of partitions that could be restored in parallel by the plugin. When the new **advanceConfFlag.conf** file is created during environment refresh or discovery operation, the default value of **restorePipelineLimit** is set to 10. The user can modify the value of this parameter to a desired value. The valid value for this field is any positive integer.

A default config file created during discovery or environment refresh operation:

```
# If the user is not sharing a common group between primary environment user and
instance user.

# Then the user needs to set parameter notCommonGroupFlag as true.

# notCommonGroupFlag=true

# During provision operation check if instance contains a database name which is
identical to the source DB name used for provisioning operation.

# By default plugin will never allow creating a VDB on the instance where source
database (or other database which is identical in name with source DB) already
exists.

# If the user still wants to create a VDB on the instance which contains a database
name which is identical to the source DB name used for provisioning operation,

# then the user needs to set parameter allowSourceDBonSameInst as true.

# allowSourceDBonSameInst=true

# Limit for parallel restores

restorePipelineLimit=10
```

DB2 plugin v4.x and onwards

DB2 plugin config file is named **db2\_plugin.conf** and is created under the **<Toolkit directory>/<Delphix\_COMMON>/plugin/DB2\_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/** directory during discovery or environment refresh operation if the file does not already exist. This file has two sections represented by the headers - `plugin_custom_parameters` and `plugin_logging_parameters`.

 It is important for the users to maintain two section headers in the `db2_plugin.conf` file. If any of the sections get deleted, the plugin will pick the default value for the parameters under the deleted section.

Plugin custom parameters

#### **Common group (`usersHaveCommonGroup`)**

- This parameter sets the permission for the "mnts" directory located under **<Toolkit dir>/DB2** directory and for the "logs" directory located under the **<Toolkit directory>/<Delphix\_COMMON>/plugin/DB2\_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/** directory.
- Set the **`usersHaveCommonGroup`** parameter as ***True***, if the primary group of the primary environment user (user which is used to do discovery) is shared with the instance user.
- Set the **`usersHaveCommonGroup`** parameter as ***False***, if the primary environment user and the instance user do not share any user group.
- Once the necessary changes are made, refresh the environment in order to apply the changes.

By default, the **usersHaveCommonGroup** parameter is set to **True**. The valid values for this parameter are true or false.

#### **Allow Source Database on Same Instance (*allowSourceDbOnSameInstance*)**

By default, the DB2 Plugin restricts the provisioning of a VDB on a DB2 instance which contains a database with the same name as the VDB's source database For example:

- When provisioning a VDB from a VDB then the latter is treated as the source database.
- When provisioning a VDB from a dSource then the staging database representing the dSource is treated as the source database.

If the user wants to provision a VDB on an instance which contains a database with the same name as the VDB's source database, then the parameter **allowSourceDbOnSameInstance** must be set to true. The valid values for this parameter are true or false.

#### **Restore pipeline limit (*restorePipelineLimit*)**

Db2 DPF Plugin performs restoration of all non-catalog partitions in parallel.

The parameter **restorePipelineLimit** allows the user to configure the number of partitions that could be restored in parallel by the plugin. When the new **advanceConfFlag.conf** file is created during environment refresh or discovery operation, the default value of **restorePipelineLimit** is set to 10. The user can modify the value of this parameter to the desired value. The valid value for this field is any positive integer.

Plugin logging parameters

This feature provides three options to configure and control enhanced logging by the plugin:

1. To set debug log levels.
2. To set active log file size.
3. To set log retention levels.

Delphix users can modify the above parameters defined under the `plugin_logging_parameters` section of this file.

Setting log levels (level)

Delphix users can set the logging level of the plugin-generated logs by setting the parameter **level** under the `plugin_logging_parameters` header. Higher logging levels will help to expedite debugging issues. There are two levels of logging which are: Info and Debug. The configured logging level will apply to all the objects (both dSources and VDBs) present on a staging/target host. For example; if we have 4 dSources on a host associated with a Delphix Engine then the log level will apply to all the dSources.

#### **Log level description:**

- level=INFO: This level will print only informational logs. This is the default log level.
- level=DEBUG: This level will print informational logs and debug statements.

#### **Setting maximum size of active log file (*logFileSize*)**

Delphix users can set the maximum size of the active log file by defining the value of the `logFileSize` parameter under the `plugin_logging_parameters` header of the `db2_plugin.conf` file. Once this maximum size limit is reached, the plugin will rotate the log as per the retention property described below. This parameter only takes in a positive integer value. The minimum value of this parameter is 1 MB and the maximum value is 10 MB. The default value is 1 MB.

#### **Setting log retention levels (*retention*)**

Delphix users can set a retention level for plugin-generated logs for each dataset (<Db name>.diag.log) using the parameter **retention** under the `plugin_logging_parameters` header. As per this parameter, the log files are moved

(archived), renamed or deleted once they reach the value set in the logFileSize parameter. New incoming log data is directed into a new fresh file (at the same location).

By default, the value for this parameter will be set to a minimum value of 2. The user can change this value and set its value within the range 2 and 50. For example; if **retention** is set to 4, the plugin will have the following log files: <DB Name>.diag.log, <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB Name>.diag.log.4.

- File <DB Name>.diag.log is the active log file
- File <DB Name>.diag.log.1 is the most recent archive log file
- File <DB Name>.diag.log.4 is the oldest one

 The DB2 plugin will ignore values for a parameter if the values do not fit the description above and will continue the operation with the default set of values for that particular parameter.

db2\_plugin.conf

```
#
# The parameters must not be left padded with spaces. The plugin will otherwise not
# accept the specified parameter
# values and will use the default values.
#

[plugin_custom_parameters]
#
# If the user has not shared a common group between primary environment user and
# instance user.
# Then the user needs to set parameter usersHaveCommonGroup as False.
#

usersHaveCommonGroup=True

#
# During provision operations the plugin checks if the target instance contains a
# database name which is identical to
# the source DB name from which the VDB is to be created. By default the plugin will
# never allow creating a VDB on the
# instance where the source database already exists, or on any instance that has a
# database with the same name. If the
# users still want to create a VDB on an instance which contains a database with the
# same name as the source DB then
# they need to set parameter allowSourceDbOnSameInstance as True.
#

allowSourceDbOnSameInstance=False

#
# If the users want to control the number of parallel restores then they can tune the
# parameter restorePipelineLimit.
# By default the value of this parameter would be 10.
#
```

```

restorePipelineLimit=10

[plugin_logging_parameters]
#
# This flag will set the debug level of plugin logs on the remote server (both
staging and target). There are two levels:
# Info
# Debug
# The above are the only valid values that can be assigned. If any other value is
assigned, the plugin will set the
# default level as Info. the string is case insensitive so info, Info and INFO are
acceptable.
#
level=INFO

#
# This parameter will set the maximum size of the active log file in MB. Once this
limit is reached, the plugin will
# rotate the log as per the retention property defined below. The minimum value of
this parameter is 1 MB and maximum
# value is 10 MB. This parameter only takes in a positive integer value. The default
value is 1 MB
# logFileSize=<positive integer>
#
logFileSize=1

#
# Whenever the size of <DB Name>.diag.log file exceeds the value provided by
logFileSize parameter then the plugin will
# rename the active log file to <DB Name>.diag.log.<number> and a new log file with
name <DB Name>.diag.log will be
# generated. For example, if LogRetention is set to 4, the plugin will have the
following log files: <DB Name>.diag.log,
# <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB
Name>.diag.log.4.
# File <DB Name>.diag.log.4 will be the oldest one.
# File <DB Name>.diag.log.1 will be the most recent archive log file.
# File <DB Name>.diag.log will be the active log file.
# The minimum and default value for retention flag is 2.
# retention=<positive integer>
#
retention=2

```

#### Instance user requirements

- The instance owner of each instance you wish to use within staging or a target host must be added as an environment user within the Delphix engine. See [Managing Db2 Users and Instance Owners](#)
- For HADR synced dSources the staging instance owner must be able to "read" the ingested database contents as Delphix will check the validity of the database by querying tables before each dSource snapshot.

- If a container is added or deleted, the dSource will have to be resynced.

- Ensure that the following database configurations are set to default values:
  - LOGPRIMARY, LOGSECOND - default values are set by DB2 configuration advisor and shouldn't be changed. For more info, see [logsecond - Number of secondary log files configuration parameter](#)
  - LOGARCHCOMPR1, LOGARCHCOMPR2- the default values are set to OFF so that the workflows can work properly.

#### Database Container Requirements

- All Db2 database container types are fully supported with the exception of Db2 raw containers.
- It is recommended not to use special characters for source database container paths as this may create problems while parsing such container paths and may also result in failures during dSource and VDB creation.

## Sudo privilege requirements for Db2 environments

This topic describes the rationale behind specific `sudo` privilege requirements for virtualizing Db2 Databases.

Privilege	Sources	Targets and Staging	Rationale
<code>mkdir/</code> <code>rmdir</code>	Not Required	<b>Required</b>	Delphix dynamically makes and removes directories under the provisioning directory during VDB operations. This privilege is optional, provided the provisioning directory permissions allow the delphix os user to make and remove directories.
<code>mount/</code> <code>umount</code>	Not Required	<b>Required</b>	Delphix dynamically mounts and unmounts directories under the provisioning directory during VDB operations. This privilege is required because <code>mount</code> and <code>umount</code> are typically reserved for superuser.

 It is required to specify the NOPASSWD qualifier within the "sudo" configuration file, as shown here: [Sudo File Configuration Examples for Db2 Environments](#). This ensures that the "sudo" command does not demand the entry of a password, even for the "display permissions" (i.e. "sudo -l") command. Delphix issues "sudo -l" in some scripts to detect if the operating system user has the correct sudo privileges. If it is unable to execute this command, some actions may fail and Delphix will raise an alert suggesting it does not have the correct sudo permissions. Restricting the execution of "sudo -l" by setting "listpw=always" in the "/etc/sudoers" file when the Delphix operating system user is configured to use public key authentication will cause the Delphix operating system user to be prompted for a password which will fail certain Delphix actions. Use a less restrictive setting for listpw than "always" when the Delphix operating system user is using public-key authentication.

## Sudo file configuration examples for Db2 environments

Configuring `sudo` access on AIX for Db2 source and target environments

Sudo access to `ps` on the AIX operating system is required for the detection of listeners with non-standard configurations on both source and target environments. Super-user access level is needed to determine the `TNS_ADMIN` environment variable of the user running the listener (typically **db2**, the installation owner). From `TNS_ADMIN`, the Delphix OS user **delphix\_os** can derive connection parameters.

Example: AIX `/etc/sudoers` entries for a Delphix Source

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD:/bin/ps
```

In addition to sudo access to the `mount`, `umount`, and `ps` commands on AIX target hosts, Delphix also requires `sudo` access to `nfso`. This is required on target hosts for the Delphix Engine to monitor the NFS read-write sizes configured on the AIX system. Super-user access level is needed to run the `nfso` command.

Example: AIX `/etc/sudoers` File for a Delphix Target

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/usr/sbin/mount, \
/usr/sbin/umount, \
/usr/sbin/nfso, \
/usr/bin/ps
```

Configuring `sudo` access on Linux for Db2 source and target environments

On a Linux target, sudo access to `mount`, `umount`, `mkdir`, and `rmdir` is required.

**Example: Linux `/etc/sudoers` file for a Delphix target for DB2**

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir
```

Examples of limiting `sudo` access for the Delphix OS user

In situations where security requirements prohibit giving the Delphix user root privileges to mount, unmount, make directory, and remove directory on the global level, it is possible to configure the `sudoers` file to provide these privileges only on specific mount points or from specific Delphix Engines, as shown in these two examples.

**⚠** The Delphix Engine tests its ability to run the `mount` command using `sudo` on the target environment by issuing the `sudo mount` command with no arguments. Many of the examples shown in this topic do not allow that. This causes a warning during environment discovery and monitoring, but otherwise does not cause a problem. If your VDB operations succeed, it is safe to ignore this warning.

However, some users configure the security on the target environments to monitor `sudo` failures and lock out the offending account after some threshold. In those situations, the failure of the `sudo` commands might cause the **delphix\_os** account to become locked. One work-around for this situation is to increase the threshold for locking out the user account. Another option is to modify `/etc/sudoers` to permit the **delphix\_os** user to run `mkdir`, `rmdir`, `umount` and `mount` command without parameters.

**i** Note that the following examples are for illustrative purposes and the `sudo` file configuration options are subject to change.

### Example 1

This example restricts the **delphix\_os** user's use of `sudo` privileges to the directory `/db2`.

Note that wildcards are allowed for the options on `mount` and `umount` because those commands expect a fixed number of arguments after the options. The option wildcard on the `mount` command also makes it possible to specify the file-system being mounted from the Delphix Engine.

However, wildcards are not acceptable on `mkdir` and `rmdir` because they can have any number of arguments after the options. For those commands, you must specify the exact options (`-p`, `-p -m 755`) used by the Delphix Engine.

Example `/etc/sudoers` File Configuration on the Target Environment for `sudo` Privileges on the VDB Mount Directory Only (Linux OS)

```
Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: \
/bin/mount * /db2/*, \
/bin/umount * /db2/*, \
/bin/umount /db2/*, \
/bin/mkdir -p /db2/*, \
/bin/mkdir -p -m 755 /db2/*, \
/bin/mkdir /db2/*, \
/bin/rmdir /db2/*
```

### Example 2

This example restricts the **delphix\_os** user's use of `sudo` privileges to the directory `/db2`, restricts the `mount` commands to a specific Delphix Engine hostname and IP, and does not allow user-specified options for the `umount` command.

This configuration is more secure, but there is a tradeoff with deployment simplicity. This approach would require a different `sudo` configuration for targets configured for different Delphix Engines.

A Second Example of Configuring the /etc/sudoers File on the Target Environment for Privileges on the VDB Mount Directory Only, and Allows Mounting Only from a Single Server (Linux OS)

```
Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: \
/bin/mount <delphix-server-name>* /db2/*, \
/bin/mount * <delphix-server-name>* /db2/*, \
/bin/mount <delphix-server-ip>* /db2/*, \
/bin/mount * <delphix-server-ip>* /db2/*, \
/bin/mount "", \
/bin/umount /db2/*, \
/bin/umount * /db2/*, \
/bin/mkdir [*] /db2/*, \
/bin/mkdir /db2/*, \
/bin/mkdir -p /db2/*, \
/bin/mkdir -p -m 755 /db2/*, \
/bin/rmdir /db2/*
```

## Managing Db2 environments and hosts

### Setting up Db2 environments: an overview

This topic describes the high-level process for adding Db2 environments, linking Db2 instances to the Delphix Engine, and provisioning virtual databases.

Delphix for Db2 architecture

Delphix uses a Standby server model along with Db2s High Availability Disaster Recovery feature to ingest data and stay in sync with the source database. The standby server is then snapshotted by the Delphix Engine and the snapshots can be provisioned out to one or more target servers.

**⚠** The snapshot and provision process occurs on the instance level, all databases that exist on the standby server will be provisioned out to the target machines. Similarly, actions such as bookmark, rewind, and refresh will simultaneously apply to all the databases in the instance.

Block diagram of linking architecture between Db2 environments and the Delphix engine

The linking process sets up a database inside an instance on the standby server and uses this as a HADR standby for the primary database. The staging instance must have access to a recent backup copy of the database that will be used to restore the initial copy of the dSource. Once the restoration process is complete, Delphix will issue the

HADR standby commands for the given database and ensure that the health of the HADR connection stays within the acceptable threshold values.

Db2 staging instance set up

The database level feature enables you to have 1-many mappings between instance and databases. It is also possible to set up databases from multiple primary hosts to use the same standby instance.

The choice of databases on the staging server should also take into account the expected network traffic that HADR will create between the source and staging environments.

Db2 DPF block diagram

While using DPF, the DPF environment for Db2 staging and target should be configured on separate hosts. Also, staging and target should be configured with the same number of logical partitions as the number of partitions in the source node.

## Adding a Db2 environment

This topic describes how to add a Db2 Staging environment.

### Prerequisites

- Make sure that the staging environment in question meets the requirements described in [Requirements for Db2 Hosts and Databases](#)

### Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Next to **Environments**, click the **Actions (...) menu and** select **Add Environment**.
5. In the Add Environment dialog, select **Unix/Linux** in the menu.
6. Select **Standalone Host**.
7. Click **Next**.
8. Enter a **Name** for the environment.
9. Enter the **Host IP address** or **hostname**.
10. Enter the **SSH port**. The default value is 22.
11. Enter an **OS Username** for the environment. For more information about the environment user requirements, see [Requirements for Db2 Hosts and Databases](#)
12. Select Login Type. — Username and Password - enter the OS username and password — Username and Public Key - enter the OS username. — Password Vault - select from an existing Enterprise Password Vault warning : Currently, the Enterprise Password Vault option is not supported.  
Info : Using Public Key Authentication

If you want to use public-key authentication for logging into your Unix-based environment, there are two options: use the engine's key pair or provide a key pair for this environment.

To use the engine's key pair:

- a. Select **Public Key** for the **Login Type**.
- b. Click **View Public Key**.
- c. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you will need to create it.
  - i. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by the user).
  - ii. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
  - iii. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.

As an alternative, you can provide a key pair specific for this environment via the API or CLI. See [Option 2 in this CLI Cookbook article](#) for instructions.

13. For Password, enter the password associated with the user in step 11.
14. Using Public-Key Authentication:
  - a. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write privileges to it (make sure the file is owned by the user).
  - b. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
  - c. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.
15. You can also add public key authentication to an environment user's profile by using the command-line interface, as explained in the topic [CLI Cookbook: Setting Up SSH Key Authentication for UNIX Environment Users](#)

16. For Password Login, click Verify Credentials to test the username and password.
17. Enter a **Toolkit Path** (make sure the toolkit path does not have spaces).  
For more information about the toolkit directory requirements, see [Requirements for Db2 Hosts and Databases](#)
18. To provide your own Oracle Java select the **Provide my own JDK** checkbox and click **Next**.
19. In the Java Development Kit tab enter the absolute path to your Oracle JDK and click **Next**.
20. Click **Submit**.

As the new environment is added, you will see two jobs running in the Delphix platform Job History, one to Create and Discover an environment, and another to Create an environment. When the jobs are complete, you will see the new environment added to the list in the Environments tab. If you do not see it, click the Refresh icon in your browser.

#### Post-requisites

To view information about an environment after you have created it:

1. Click **Manage**.
2. Select **Environments**.
3. Select the **environment name**.

## Managing Db2 instances

This topic explains how to manage DB2 instances on a host.

When you add an environment with the Delphix Management Application, all existing DB2 instances on the host are automatically discovered by Delphix. A list of all instances and databases are available to Delphix based on the environment discovery process.

### View instances

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. In the **Environments** panel, click on the **name of the environment** to you want to refresh.
5. Select the **Databases** tab to see a list of all DB2 instances found in the environment.

The screenshot displays two environment cards for DB2 instances. Each card has a header with a dropdown arrow and the instance name and version: 'auto1054 - 10.5.0.5 -' and 'auto1055 - 10.5.0.5 -'. Below the header, there are two tabs: 'Installation Details' (selected) and 'Databases'. The 'Installation Details' tab shows the following information for both instances:

- Allow Provisioning:** Yes
- Version:** 10.5.0.5
- Install Path:** /opt/ibm/db2/V10.5
- Instance Path:** /home/auto1054/ (for auto1054) and /home/auto1055/ (for auto1055)
- name:** auto1054 (for auto1054) and auto1055 (for auto1055)
- gid:** 102
- Pretty Name:** auto1054 - 10.5.0.5 - (for auto1054) and auto1055 - 10.5.0.5 - (for auto1055)
- Instance Name:** auto1054 (for auto1054) and auto1055 (for auto1055)
- uid:** 533

The 'Databases' tab for both instances shows the message: 'No databases found on installation.' There is a plus sign (+) in the top right corner of each card, indicating that more details can be expanded.

### Updating instances on a host

If you add or remove any DB2 instances from a host you must refresh the environment using the steps listed in [Environment Refresh](#) to update the list of instances available to Delphix. Additionally, the environment users must be updated to match the DB2 instance owners as detailed in [Managing DB2 Users and Instance Owners](#)

## Managing Db2 users and instance owners

All DB2 Delphix operations such as linking, snapshot, and provisioning always occur on the database level. As a result, we require that any DB2 instance that you wish to use either as Staging or Target must have its associated instance owner added as an environment user to the host within Delphix. Please perform the following steps to add each DB2 instance owner you to use on the host.

It is important to note that Delphix will not create new instances on the host and can only use existing DB2 instances that it finds on the host machine. For more information on instance management refer to [Managing Db2 Instances](#)

### Adding environment users

#### Procedure

1. Login to the Delphix Management application.
2. Click **Manage**.
3. Select **Environments**.
4. Click on the existing environment name you want to modify and open the environment information screen.
5. In the Details tab, click the **Plus** icon located next to Environment users.
6. Enter the Username and Password for the OS user in that environment.

1. If you want to use public-key encryption for logging into your Unix-based environment:
  - a. Select **Public Key** for the **Login Type**.
  - b. Click **View Public Key**.
  - c. Copy the public key that is displayed, and append it to the end of your `~/ .ssh/ authorized_keys` file. If this file does not exist, you will need to create it.
    - i. Run `chmod 600 authorized_keys` to enable read and write privileges for your user.
    - ii. Run `chmod 755 ~` to make your home directory writable only by your user.

The public key needs to be added only once per user and per environment.

7. Click the **Check** icon to save the new user.
8. To change the primary user for this environment, click the **Star** icon next to Environment Users. Only the primary user will be used for environment discovery.
9. To delete a user, click the **Trash** icon next to their username.

## Environment attributes for hosts with Db2

This topic describes the more advanced attributes for Db2 data platforms.

### Common editable attributes

Attribute	Description
Environment Users	The users for that environment. These are the users who have permission to ssh into an environment or access the environment through the Delphix Connector. For more information on the environment user requirements, see the <b>Requirements</b> topics for specific data platforms.
Host Address	The IP address of the environment host.
SSH Port	The SSH port number used for the environment.
Toolkit Path	The plugin path for the environment. Delphix uses the Toolkit path (Toolkit is a synonym for Plugin) for logs, mount points, and keeping lib files.
Notes	Any other information you want to add about the environment

## Linking data sources and syncing data with Db2

This section covers the following topics:

- [Linking a dSource from a Db2 database: An overview](#)
- [Linking a Db2 dSource](#)
- [Data management settings for Db2 dSources](#)
- [Backup source database](#)
- [Working with Db2 snapshots](#)
- [Source sizing implementation for datasets](#)

## Linking a dSource from a Db2 database: An overview

This topic describes basic concepts behind the creation of dSources from Db2 instances.

### Database level operation

Associated with an instance is the concept of an instance owner. This is the user who "owns" that instance and has SYSADM authority over the instance and all databases inside that instance. SYSADM authority is the highest level of authority in Db2 and lets this user perform several database management activities such as upgrade, restore, and editing configurations. More information about instances is located in the [IBM knowledge center](#)

#### **Db2 database level support**

Delphix operates at the database level and requires that

- The staging and target hosts must have the empty instances created prior to Delphix using them
- The desired OS user to execute commands related to dSource and VDB operation for each instance has been added as an environment user

Note:

- Make sure the staging instance used for linking doesn't have an existing restoring database with the same name.
- The dSource ingestion or VDB provisioning should not be performed on the source instance to maintain the integrity of the source database.

### Data ingestion

Db2 for Delphix ingests data by using a staging database created on a discovered Standby instance of Db2. The dSource uses the staging database to stay in sync with the production database. This is done by first going through the linking process during which a full backup is used to recover an initial copy of the production database to the staging database. Storage for the staging database is provided by Delphix via an NFS mount to storage exported by the Delphix system.

 A single standby instance can contain data from multiple source databases.

### Pipelining logic for implementing parallel restores

The plugin employs a parallel pipeline methodology so that the restore operation of non-catalog partitions can be performed in parallel in the Database Partitioning Feature (DPF). The number of parallel restores is determined by the value of "restorePipelineLimit" (default value is 10) in <Toolkit directory>/advanceConfFlag.conf. For more details on this please refer to [Requirements for Db2 Hosts and Databases](#). The parameter "restorePipelineLimit" is configurable by end-users. The plugin performs parallel restore for all non-catalog partitions. For e.g. If the total number of non-catalog partitions is 15, and the "restorePipelineLimit" parameter is set to 10, the first set of 10 restores will happen in parallel. The plugin will track the restore of each partition present in the pipe. Whenever a restore of a partition completes, it will move out from the pipe and a new partition will enter into that pipe. Thus, the plugin ensures that the pipe will always have the user-configured number of partitions being restored (default=10).

In case of a restore failure for a particular partition, the plugin will track that failure and will print the same in the plugin-generated logs so that the user can take the necessary action. If the user received failure during restore operation for a few partitions and then decided to manually initiate the restores for failed partitions, the plugin will

verify the datapaths during snapshot operation. In case it finds wrong path information (such as paths outside the mount point), then the plugin will error out of the operation.

The plugin will track the status of each restore in a file named <DB Name>\_metadata.json. The plugin can handle a scenario where the staging host reboots in-between the parallel restores. In this case, the user can perform a “Resynchronisation” operation again. At this time, the remaining restores will resume from scratch. For more details on this please refer to [Requirements for Db2 Hosts and Databases](#)

#### Data synchronization

Delphix provides the following options to keep your dSource in sync with the source database:

1. During the linking process, you can set up a HADR connection between the original source database and the Standby instance. This allows the Standby instance using HADR for log shipping to always keep its databases in sync with the source. It is important to note that a single Standby instance (dSource) can contain multiple databases from multiple different servers and instances as long as each database has a unique name.
2. The users can opt for the "**Staging Push**" feature by selecting the checkbox "**Use Staging Push**". With this feature, the user can manage the restore and roll forward of a staging database without involving the Delphix Engine.
3. Users can opt for a non-HADR method of database ingestion. The database will be ingested to a standalone staging host and the user can trigger a resynchronization operation with a most recent online full backup to keep the staging database up to date with the source database.
4. Users can opt for the Delphix Recovery with the **Customer Supplied Archive Logs** method. During an update, the dSource user can trigger a snapshot operation where user-provided archive logs will get applied to the staging database.
5. Optionally, when the DPF feature is in use, users can use the “Customer Supplied Archive Logs” feature. Users need to place archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions then the user-provided log path will have folder names NODE0000 and NODE0001. Both the folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

 Delphix HADR standby configuration may not meet Db2 DR requirements and should only be used for Delphix use cases.

## Linking a Db2 dSource

This topic describes how to link a Db2 staging dSource.

### Prerequisites

Be sure that the source and staging instances meet the host requirements and the databases meet the container requirements described in [Requirements for Db2 Hosts and Databases](#)

### Source database preparation

#### Instance owner permissions

Delphix uses the Db2 instance owner account on the dSource for multiple operations, including verifying the data inside the databases. In order to ingest a database on the staging server with different instances, we need permissions on the source database in order to perform a restore on the staging server. As an example, if we have an instance named "auto1051" at the source with a database name "delphix" and we want to create a dSource on the "auto1052" instance on the staging server, then you must explicitly grant DBADM and SECADM to the dSource instance "auto1052" on the source instance using the following steps:

1. Connect to the source database as the source instance owner.
  - a. *connect to <DB\_NAME> user <SOURCE\_INSTANCE\_OWNER>*
2. Issue database grant command
  - a. *grant DBADM, SECADM on the database to user <DSOURCE\_INSTANCE\_OWNER>*
  - b. *grant DBADM, SECADM on the database to user <VDB\_INSTANCE\_OWNER>*
3. Repeat step 2 for every database to be included in the dSource, on the corresponding source database.

Determine if your dSource will be a non-HADR instance, a HADR single standby instance, or a HADR multiple standby instance. Non-HADR dSources can only be updated via a full dSource resync from a newer backup file

#### Non-HADR Database

1. See the "InstanceOwner Permissions" section above.
2. Ensure that the source database has the necessary user permissions for the provisioned VDBs as described in [Database Permissions for Provisioned Db2 VDBs](#)

#### HADR single standby database

1. All items in Non-HADR Database section above.
2. The following database configuration settings must be set:
  - a. *update db cfg for <DB\_NAME> using HADR\_LOCAL\_HOST <PRIMARY\_IP> HADR\_LOCAL\_SVC <PRIMARY\_PORT> immediate*
  - b. *update db cfg for <DB\_NAME> using HADR\_REMOTE\_HOST <STANDBY\_IP> HADR\_REMOTE\_SVC <STANDBY\_PORT> immediate*
  - c. *update db cfg for <DB\_NAME> using HADR\_REMOTE\_INST <STANDBY\_INSTANCE\_NAME> immediate*
  - d. *update db cfg for <DB\_NAME> using HADR\_SYNCMODE SUPERASYNC immediate*
3. If database configuration parameter LOGINDEXBUILD is set to OFF, do the following:
  - a. *update db cfg for <DB\_NAME> using LOGINDEXBUILD ON*
  - b. Force off all connections to the database and reactivate the database
4. If database configuration parameter LOGARCHMETH1 is set to OFF, do the following:
  - a. *update db cfg for <DB\_NAME> using LOGARCHMETH1 XXXX (must be a valid log archiving method)*
  - b. Take an offline backup
5. If LOGARCHMETH1 points to a third-party backup server (i.e. TSM or Netbackup) define LOGARCHMETH2 to disk
  - a. *update db cfg for <DB\_NAME> using LOGARCHMETH2 DISK:<full path to archive log directory>*

- i. Log files in the directory must be available from the time of the backup until the restore has successfully completed on the dSource.
6. *db2 start hadr on db <DB\_NAME> as primary by force*
7. Take a full online backup as defined in the "Backup Source Database" section below.
8. Record the following information, as it must be entered on the Delphix Engine while creating the dSource.
  - a. HADR Primary hostname
  - b. HADR Primary SVC
  - c. HADR Standby SVC (auxiliary standby port)

#### HADR multiple standby databases

This **assumes** a single standby database HADR setup already exists. The existing standby will be referred to as the main standby. The new delphix standby will be referred to as the auxiliary standby.

1. The following database configuration settings must be set on the primary database:
  - a. *update db cfg for <DB\_NAME> using HADR\_SYNCMODE <SYNC MODE> immediate – set whichever sync mode you wish to use on your main standby.*
  - b. *update db cfg for <DB\_NAME> using HADR\_TARGET\_LIST "<MAIN\_STANDBY\_IP:MAIN\_STANDBY\_PORT|AUXILIARY\_STANDBY\_IP:AUXILIARY\_STANDBY\_PORT>" immediate*
    - i. You may have up to two auxiliary standbys defined separated by a '|'; one of which must be the delphix dSource.
2. *stop hadr on db <DB\_NAME>*
3. *start hadr on db <DB\_NAME> as primary by force*
4. *Take a full online backup as defined in the "Backup Source Database" section below. While this backup is running, you may continue with step 5.*
5. *The following database configuration settings must be set on the existing main standby database:*
  - a. *update db cfg for <DB\_NAME> using HADR\_SYNCMODE <same mode as defined in 1.a above.> – It must be the same value used for the primary database.*
  - b. *update db cfg for <DB\_NAME> using HADR\_TARGET\_LIST "<PRIMARY\_IP:PRIMARY\_PORT|MAIN\_STANDBY\_IP:MAIN\_STANDBY\_PORT>"*
6. *stop hadr on db <DB\_NAME>*
7. *start hadr on db <DB\_NAME> as standby*
8. *Record the following information, as it must be entered on the Delphix Engine while creating the dSource (the auxiliary standby database):*
  - a. HADR Primary hostname
  - b. HADR Primary SVC
  - c. HADR Standby SVC (auxiliary standby port)
  - d. HADR\_TARGET\_LIST <PRIMARY\_IP:PRIMARY\_PORT|MAIN\_STANDBY\_IP:MAIN\_STANDBY\_PORT>

#### Delphix recovery with customer supplied archive logs

The Delphix Recovery with Customer Supplied Archive Logs (formerly known as Delphix Backup and Logs ingestion), feature allows users to provide Delphix with the location of the source database archive logs. Full backups only have to be restored during dSource creation, or during RESYNC operations when there are exceptions, for example, lost/corrupt log files. Archived logs get applied during the snapshot operation.

A full backup is required to create a dSource and prior to the snapshot operation, users can provide the archive logs to update the dSource during the snapshot operation, user-provided logs will be applied to the staging database. Applying the logs on a regular basis allows users to keep their dSource in sync with their source database. The staging database will always be in a roll forward pending state. The Plugin performs validation before applying the logs. Plugin managed Pre and Post Hooks can be used for preparing and purging the full backups and archive logs. A list of logs that are available for purging is stored in the snapshot metadata of the dSource. In case DPF is enabled, users need to place archive logs inside a folder with a name as NODE<Partition number> where <Partition number> is a four-digit number. For example, if the source environment has two partitions, then the user-provided log path

will have folder names as NODE0000 and NODE0001. Both these folders will have respective archive logs. Snapshot operation will be used to apply the archive logs.

HADR and non-HADR configured dSources can be moved to this feature by performing a RESYNC operation.

Delphix supports Customer Supplied Archive Logs with Db2 version 10.5 and 11.1. To use Customer Supplied Archive Logs simply check the checkbox provided during dSource creation. Customer Supplied Archive Logs require that:

- A full backup must be accessible on the staging server, it could be a shared location but must be mounted on the staging host and visible as a file system.
- Archived logs must also be accessible on the staging server
  - The following command can be used to generate archive logs from the source database;
    - db2 archive log for database <database name>
  - Instance users must have read permissions on logs so that Delphix-managed recover can apply the logs.
  - Instance users must have read permissions on logs and additional write permissions on customer-provided log location if Delphix is planning to use customer-provided log location for applying the logs.
  - If the user has placed the archive logs at a user-provided log location, then the logs must be valid and the first active log of the staging database must be present in the user-provided log location.
- If database configuration parameter LOGINDEXBUILD is set to OFF, do the following:
  - update db cfg for <DB\_NAME> using LOGINDEXBUILD ON
  - Force off all connections to the database and reactivate the database
- The customer does log purging from the provided log location. Delphix only provides the list of logs that are eligible for purging.

Limitations:

- Continuous updates to the dSource are not available. The DB\_SYNC operations apply new logs from the log location and keep the dSource updated with changes on the source.
- Read access to the staging database is not available.

Staging push

With the "Staging Push" feature, you can now manage the restore and rollforward operations from the CLI. During dSource creation (or RESYNC), the plugin will create an empty mount point and will provide a restore and rollforward template that will allow you to restore the database. You can restore the dSource using the steps mentioned in the readme or through any other method of their choice. You can also configure the dSource with HADR by following the steps provided in the "HADR Single/Multiple Standby Database" sections above.

Once the dSource is ready, you can perform restore and rollforward operations from the CLI. After the restore, the staging database should remain in the rollforward pending state, and prior to the next snapshot, the user can do a rollforward to a specific Point-in-Time (by providing a timestamp to the rollforward command) against the available archive logs. In the case of HADR dSource, you will have to stop HADR before taking a snapshot and starting it back on after the snapshot operation is complete.

 You can create a pre-snapshot and post-snapshot hook to perform HADR stop and start operations on the staging database respectively so that you don't have to connect to the staging host every time a snapshot is captured.

Prior to the snapshot operation, the user should validate the backups and the archive logs before applying them to the staging database. Below are the user side validations:

 **User side validation prior to snapshot operation**

- The user must validate the backup files using **db2ckbkp** utility on the staging host.
- The user must validate the archive logs using **db2cklog** utility on the staging host.
- The authenticity of archive logs would be managed by the user.
- The user has to provide the first active log at the staging database log directory location after applying the logs.
- If there is a scenario where a user performed some load copy (non-logged transactions) operations on the source side then it's the responsibility of the user to make those non-logged transactions available on the staging database.

## Backup source database

### **New feature: Source database with Raw DEVICE type storage**

Several users use raw device-based tablespaces for source Db2 databases. To leverage these environments with Delphix, Delphix has built a workflow using Db2s native tools that allow Delphix to discover and convert a raw device-based tablespace into an automatic storage-based tablespace during ingestion. Once the data is ingested into staging, customers will be able to provision VDBs of the automatic storage-based database.

In order to complete the linking process, the Standby dSource must have access to a full backup of the source Db2 databases on disk. This should be a compressed online Db2 backup and must be accessible to the dSource instance owner on disk. Delphix is currently not set up to accept Db2 backups taken using third-party sources such as Netbackup or TSM. All three features of data ingestion, namely HADR, Non-HADR, and Customer Supplied Archive Logs backups must also include logs. Starting with the Db2 plugin version 3.1.1, we are also supporting full online backups, which are taken using the "exclude logs" syntax. This support is only applicable to the dSources created using the Customer Supplied Archive Logs (Backup and Logs) ingestion mechanism on a single partition.

### **Support for named pipe type DB2 backup**

Users can also provide Db2 backups of type named-pipe. Db2 plugin will check the type (type will be either named-pipe or a file) of backup and will use the restore syntax accordingly.

Example backup command for DB2 Non SSV backups: `db2_all "db2 backup database <DB_NAME> online to <Backup File Location> compress include logs"`

## Backup types supported in DPF

The type of backups supported by Db2 plugin when used with DPF are:

- SSV backups through backup files or named pipes.
- Non-SSV backups through backup files or named pipes.

Example backup command for DB2 SSV backups: `db2_all "db2 BACKUP DATABASE<DB_NAME> ON all dbpartitionnums online to <Backup File Location> compress include logs"`

Example backup command for DB2 Non SSV backups: `db2_all "db2 backup database <DB_NAME> online to <Backup File Location> compress include logs"`

### **Best practices for taking a backup**

The following best practices can help improve backup and restore performance:

1. Compression should be enabled
2. Following parameters should be optimally configured:
  - a. Utility Heap Size (UTIL\_HEAP\_SZ)
  - b. No. of CPUs

- c. No. of Table Spaces
  - d. Extent Size
  - e. Page Size
3. Parallelism & Buffer configuration may be used to improve backup performance. Parameters that should be configured are:
- a. Parallelism
  - b. Buffer Size
  - c. No. of Buffers

More information about backup best practices is available in [IBM Knowledge Center](#)

Procedure

1. Login to the **Delphix Management Application**.
2. On the **Databases** tab of the Environment Management screen, add a source config against the discovered staging instance.
  - a. While using the Db2 plugin, source databases are not discoverable, as the source environment is not discovered. The source database is necessary to link a Db2 dSource. So, it is required to manually add the source database name to the Db2 instance source configuration. Without the SourceConfig, you may not be able to link a dSource. To add a source config, follow the steps from i to iii below:
    - i. To add a database that will represent the staging database for the dSource, click the **Plus (+)** icon to the right of **Databases**.
    - ii. Inside the **Add Database** dialog box that appears,
      - Add the **SourceConfig Name** which is the unique name that you give to the Db2 dataset. It is recommended to include the database name in the **SourceConfig Name**. As an example, if the source database name is TEST you can name the **SourceConfig Name** as TEST\_DB2\_CONTAINER
      - **Database Name** will be the name given to the staging database when it is created in the Linking process.
        - In this example it would be TEST.
        - This name is the same name as the source database where the backup was generated for the ingestion into this staging database.
    - iii. Click Add button to add the SourceConfig to the engine, The SourceConfig is now ready to be linked as a dSource.

**Add Database** [Close]

SourceConfig Name (Required) \*  
 TEST\_DB2\_CONTAINER

The source config will give a unique identity to db2 dataset. It is recommended that the source config name includes the database name.

Database Name  
 TEST

Database name to restore from.

[Cancel] [Add]

3. There are two ways to add the dSource.
  - a. From Management Service Menu:
    - i. Then, click **Manage** and select **Datasets**.
    - ii. Click the **Plus (+)** icon and select **Add dSource**.
    - iii. Review the **Add dSource** preparation page.
    - iv. Click **Next** to choose the **dSource Type**
    - v. Select **Source Based dSource**
    - vi. Click **Next** and select the **SourceConfig** created earlier, in this example, TEST\_DB2\_CONTAINER
    - vii. Proceed with the **Add dSource** wizard.
  - b. From the Environment Databases page:
    - i. Select the **SourceConfig** (Database) from the **Databases** section on the selected DB2 instance where the dSource staging database is to be created.
    - ii. To the right of the desired SourceConfig, click the **Add dSource** link.
    - iii. Proceed with the **Add dSource** wizard.
4. In the **Add dSource** wizard, select the required source configuration. Consider the following when choosing an ingestion method.
  - a. Users can specify their own mount path to host the dSource dataset by specifying the path in the **Mount Base** field.
  - b. The restore and rollforward operations on the staging database can be managed by selecting the **“Use Staging Push”** checkbox. If the **“Use Staging Push”** checkbox is selected, the other checkboxes must not be selected.
  - c. If you are working with a HADR setup and want to ingest the database on a staging using HADR configurations, you need to check the **Link against source using HADR** checkbox and uncheck the **Customer Supplied Archive Logs** checkboxes. However, if you want to setup a dSource using HADR configurations using Staging Push, you need to only select the **Staging push** checkbox and handle restore and HADR configuration manually.
  - d. To use a non-HADR method for database ingestion, you need to uncheck the **Link against the source using HADR** and **Customer Supplied Archive Logs** checkboxes.
  - e. To use the **Customer Supplied Archive Logs** method for database ingestion check the **Customer Supplied Archive Logs** checkbox and uncheck the **Link against source using HADR** checkbox and enter the path in **Archive Log Path**.

- f. To use the **Database partition feature** check **Use DPF** checkbox and uncheck the **Link against the source using HADR** checkbox. For more information on DPF please view [IBM Db2 Overview](#).

5. The **database name** is mandatory and must be unique for a given instance. This is the name that the database was on the instance it was restored from.
6. If the user is planning to create a dSource with the "**Staging Push**" feature then the user must need to select the "**Use Staging Push**" checkbox.
7. Enter the complete **Backup Path** where the database backup file resides. If no value is entered, the default value used is the instance home directory. If there are multiple backup files for a non-DPF database on the backup path, the most current one will be used. If there are multiple sets of backup files for a DPF database on the backup path, the most recent one will be used.
8. If the backup files are split across multiple filesystems, you can enter multiple backup paths by dynamically adding an **Additional Backup Path** field by clicking on the **Add** button. Make sure to enter the path containing the first part of the backup under the **Backup Path** field and the subsequent paths in **Additional Backup Paths**.
9. Optionally, you can add the **Parallelism factor for Database restore** to provide the degree of parallelisation to run the database restore operation. If no value is entered, the Db2 plugin inherently assigns parallelism factor.
  - a. Parallelism factor depends on the resources provided on the staging host, you may not see any difference in performance if there aren't enough resources for Db2 plugin to implement the parallelism.

- b. You can provide any positive integer value for parallelism factor. Db2 plugin will provide that level of parallelism given that the system has appropriate resources to offer.
  - c. Parallelism factor is inversely proportional to the Database restore time, which implies that a higher parallelism factor will result in reduced restoration time.
  - d. For optimal performance during restoration, make sure to provide the same parallelism factor while creating the backups.
10. If the user wants to roll forward a snapshot to a user-specified timestamp, then the user must select the **Rollforward to PIT** checkbox. Users can also manually do this through the snapshot option.  
Info : The user-specified timestamp needs to be provided along with the timezone. For example, 2021-11-14-04.15.00 **UTC**. If the timezone is not entered, then the user's local timezone is considered.
11. Optionally, users can set the database configuration parameters during the linking operation in the **Config Settings** section.
12. Optionally, users can provide a bash script as a **Plugin** defined hook. Delphix has two Plugin managed Hooks:
- a. **Plugin Pre-Restore Hook:** The bash script entered in this field will get executed before restoration. This hook is useful in such cases where the users want to prepare the full backup before the restore operation.
  - b. **Plugin Post-Restore Hook:** The bash script entered in this field will get executed after completion of the restore operation. This hook is useful in such cases where the user wants to purge the full backup file after the restore operation.

```
1. Plugin managed pre-Hook - User can copy the required full backup file
from some remote location to staging host. Below is an example of such bash
script (name of below script is copyBackup.sh)
#!/bin/bash
```

```
# Copying backup file from a remote host remote.delphix.com
scp auto1051@remote.delphix.com:/backuplocation/
R74D105A.0.auto1051.DBPART000.20180510073639.001 /db2backup/
```

The user can provide the above script in Plugin managed pre-Hook field as "sh copyBackup.sh"

```
2. Plugin managed post-Hook - User can purge the full backup file from the
staging host. Below is an example of such bash script (name of below script
is purgeBackup.sh)
#!/bin/bash
```

```
# Purging full backup file from staging host for saving the staging storage
rm -f /db2backup/R74D105A.0.auto1051.DBPART000.20180510073639.001
```

The user can provide the above script in Plugin managed post-Hook field as "sh purgeBackup.sh"

13. If the dSource is to use **HADR** please enter the following fields. For more information about HADR please view [Linking a dSource from a Db2 Database: An Overview](#)
- a. Enter a fully qualified HADR Primary Hostname. This is a required field for HADR and must match the value set for HADR\_LOCAL\_HOST on the master.

- b. Enter the port or /etc/services name for the HADR Primary SVC. This is a required field for HADR and uses the value set for HADR\_LOCAL\_SVC on the master.
  - c. Enter the port or /etc/services name for the HADR Standby SVC. This is a required field for HADR and uses the value set for HADR\_REMOTE\_SVC on the master.
14. If you are using **Customer Supplied Archive Logs** for dSource creation complete the following fields:
- a. Check the Customer Supplied Archive logs checkbox
  - b. Provide the log location of the archive logs. In this location, users can load copy files by appending schema and table name to it so that plugin can process those load copy files during log apply process. Archive logs will be used for applying the logs during the snapshot operation. This location must be a part of the staging server and this location must be different than full backup location.

- c. The **Archive Log Location is READ ONLY**( default) option indicates whether Delphix should copy the log files to the dSource’s filesystem prior to the log apply process. If this is not selected the staging database will read the log files directly from the user-provided log location and perform the log apply operation.

warning : Special considerations for Archive Log Location is READ ONLY

If this operation is performed on the source database and user want the Plugin to process the load files place the load copy files in your location and append the schema and table names (for example: <DB Name>.<Number>.<Instance>.DBPART<partNumber>.<Timestamp>.001.<schema name>.<table name>) to the load copy file names

If you do not want to process load copy files via the Plugin place the load copy files in a similar structure as it is on the source or set a DB2 registry parameter DB2LOADREC

warning : Special consideration during dSource upgrade from older version plugin to Customer Supplied Archive Logs feature enabled plugin

Suppose the user is having a dSource with an older version of the plugin and now wants to upgrade that dSource to **Customer Supplied Archive Logs** feature then the user needs to perform the following steps :

- i. Go to the configuration tab of dSource and then click on the custom sub-tab.
- ii. Click on the edit icon.
- iii. Check the **Customer Supplied Archive Logs** and **Archive Log Location is READ ONLY** checkbox.
- iv. Click on submit and then go for RESYNC operation to upgrade the dSource.

- 15. Click **Next**.

16. Enter a name and select a group for your dSource.  
Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups](#) for more information.
17. Click **Next** and set the **Staging Environment** to be the same as the dSource host. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance.  
warning : Changing the Environment User  
If you need to change or add an environment user for the dSource instance, see [Managing Db2 Users and Instance](#)  
Info :Ensure that the Staging environment must be the environment that you have chosen to create the source config.  
Select the **User** from the drop-down and set the **SNAPSHOT PARAMETERS** for the dSource snapshot.
  - a. Click on the **Timestamp** input field to enter the timestamp at which the snapshot will be taken.  
The user-specified timestamp needs to be provided along with the timezone in YYYY-MM-DD-HH.MM.SS format. For example, 2022-03-12-04.15.00**UTC**. If the timezone is not entered, then the user's local timezone is considered.  
Providing the timestamp will only work if the user has checked the **Rollforward to PIT** option in step 9 above.
  - b. Select **Resynchronize dSource** to resynchronize the dSource. This will force a non-incremental load of data from the source similar to when the dSource was created. This action avoids duplicating storage requirements and maintains a Timeflow history.
18. The Delphix Engine will initiate two jobs to create the dSource: DB\_Link and DB\_Sync. You can monitor these jobs by clicking Active Jobs in the top menu bar, or by selecting System > Event Viewer. When the jobs have completed successfully, the database icon will change to a dSource icon on the Environments > Host > Databases screen, and the dSource will also appear in the list of Datasets under its assigned group. Then, click **Next** and you'll get the Policies section. Set the desired **Snapsync Policy** for the dSource. For more information on policies see [Advanced Data Management Settings for Db2 dSources](#)
19. Click **Next** and specify any desired pre- and post-scripts. For details on pre- and post-scripts, refer to [Customizing Db2 Management with Hook Operations](#)
20. Click **Next**. Review the dSource Configuration and Data Management information in the Summary section.
21. Click **Submit**.

 **The dSource configuration screen**

After you have created a dSource, the **dSource Configuration tab** allows you to view information about it and make modifications to its policies and permissions. In the **Datasets** panel, select the dSource you wish to examine. You can now choose the configuration tab to see information such as the **Source files, Data Management** configuration, and **Hook Operations**.

 **Purging of archive logs after snapshot operation**

Logs can be purged from your log location after the snapshot operation. The Plugin will preserve the list of logs that are eligible for purging in the snapshot's metadata. The snapshot metadata can be accessed via the Delphix CLI or API.

## Data management settings for Db2 dSources

This topic describes advanced data management settings for dSources.

When linking a dSource, you can use custom data management settings to improve overall performance and match your specific server and data environment's needs. If no specific settings are required, leverage default data management settings.

### Accessing data management settings

There are three ways to set or modify data management settings for dSources:

1. During the dSource linking process, in the Policies tab of the Add dSource wizard, select the **Retention Policy**.
2. Or select **Manage**, then select **Policies**.
3. In the Policies screen, select the **Retention** tab. To manage retention on target after the dSource snapshots have been deleted from the replication source, select the **Replica Retention** tab.
4. To add a new retention policy click the **+Retention** button, and to add a new replica retention policy on the replication target, click the **+Replica Retention** button.
5. This will open the Retention or the Replica Retention Policy wizard, depending upon the above selection. Enter a policy name along with required retention details and click **Submit**. For more information, see [Policies for Scheduled Jobs](#)

### Retention policies - retention/replica retention

Retention policy defines the length of time Delphix Engine retains snapshots within its storage. To support longer retention times, you may need to allocate more storage to the Delphix Engine. The retention policy – in combination with the SnapSync policy – can significantly impact the performance and storage consumption of the Delphix Engine.

Replica Retention policies define how long the snapshots are retained on replicated namespaces for dSources and VDBs after they have been deleted on the replication source. Normally, the snapshots that have been deleted on the replication source engine are also deleted on the replication target engine. A new retention policy is introduced to provide an extended lifetime of such snapshots on the replication target.

### Benefits of longer retention

With increased retention time for snapshots and logs, you allow a longer (older) rollback period for your data.

Common use cases for longer retention include:

- SOX compliance
- Frequent application changes and development
- Caution and controlled progression of data
- Reduction of project risk
- Restore to older snapshots

## Backup source database

### **Source database with Raw DEVICE type storage**

Several users use raw device-based tablespaces for source DB2 databases. To leverage these environments with Delphix, Delphix has built a workflow using Db2s native tools that allow Delphix to discover and convert a raw device-based tablespace into an automatic storage-based tablespace during ingestion. Once the data is ingested into staging, customers will be able to provision VDBs of the automatic storage-based database.

In order to complete the linking process, the Standby dSource must have access to a full backup of the source Db2 databases on disk. This should be a compressed online DB2 backup and must be accessible to the dSource instance owner on disk. Delphix is currently not setup to accept DB2 backups taken using third-party sources such as Netbackup or TSM. All three features of data ingestion, namely HADR, Non-HADR, and Customer Supplied Archive Logs backups must also include logs. Starting with Db2 plugin version 3.1.1, we are also supporting full online backups, which are taken using the "exclude logs" syntax. This support is only applicable to the dSources created using the Customer Supplied Archive Logs (Backup and Logs) ingestion mechanism on a single partition.

Example backup command: `db2 backup database <DB_NAME> online compress include logs`

### **Best practices for taking a backup**

The following best practices can help improve backup and restore performance:

1. Compression should be enabled
2. Following parameters should be optimally configured:
  - a. Utility Heap Size (UTIL\_HEAP\_SZ)
  - b. No. of CPUs
  - c. No. of Table Spaces
  - d. Extent Size
  - e. Page Size
3. Parallelism & Buffer configuration may be used to improve backup performance. Parameters that should be configured are :
  - a. Parallelism
  - b. Buffer Size
  - c. No. of Buffers

More information about backup best practices is available in [IBM Knowledge Center](#)

## Procedure

1. Login to the Delphix Management Application using Delphix Engine credentials or as the owner of the database from which you want to provision the dSource.
2. On the **Databases** tab of Environment Management screen, add a source config against discovered staging instance.
3. Then, click **Manage**.
4. Select **Datasets**.
5. Click the Plus (+) icon and select **Add dSource**, you'll get a list of available source configs using which you can go for dsource creation.
6. In the **Add dSource** wizard, select the required source configuration.
7. If you are working with an HADR setup, please leave the HADR checkbox checked unless you're working with Staging push dSource.
8. The **database name** is mandatory and must be unique for a given instance. This is the name that the database was on the instance it was restored from.

9. Enter the complete **Backup Path** where the database backup file resides. If the field is kept blank, the instance home directory will be used as the default value. If there are multiple backup files for a database on the backup path, the latest one will be used. If the backup files are split across multiple filesystems, you can provide them as additional backup paths with the first path being populated in the **Backup path** field.
10. Enter the **Log Archive Method1** you wish to use for the database. If no value is entered, the default value used is [DISK:/mountpoint/dbname/arch](#)
11. Optionally, users can set the database configuration parameters during the linking operation in the **Config Settings** section.
12. If the dSource is to use HADR please enter the following fields. If it will not use HADR skip ahead to step 13. For more information about HADR please view [Linking a dSource from a Db2 Database: An Overview](#)
  - a. Enter a fully qualified HADR Primary Hostname. This is a required field for HADR and must match the value set for HADR\_LOCAL\_HOST on the master.
  - b. Enter the port or /etc/services name for the HADR Primary SVC. This is a required field for HADR and uses the value set for HADR\_LOCAL\_SVC on the master.
  - c. Enter the port or /etc/services name for the HADR Standby SVC. This is a required field for HADR and uses the value set for HADR\_REMOTE\_SVC on the master.
13. Click **Next**.
14. Select a **dSource Name** and **Database Group** for the dSource.
15. Click **Next**. You will get Data Management section where you need to specify staging environment and user which will be used for dsource creation.
16. Set the **Staging Environment** to be the same as the dSource host.
17. Select the **Staging Environment User** to be the same as the instance owner of the dSource instance. Info : [Changing the Environment User](#)  
If you need to change or add an environment user for the dSource instance, see [Managing Db2 Users and Instance Owners](#)
18. Then, click **Next** and you'll get the Policies section. Set the desired **Snapsync Policy** for the dSource.
19. Click **Next**.
20. Specify any desired pre- and post-scripts. For details on pre- and post-scripts.
21. Click **Next**.
22. Review the dSource Configuration and Data Management information in the summary section.
23. Click **Submit**.

The Delphix Engine will initiate two jobs to create the dSource: DB\_Link and DB\_Sync. You can monitor these jobs by clicking Active Jobs in the top menu bar, or by selecting System > Event Viewer. When the jobs have completed successfully, the database icon will change to a dSource icon on the Environments > Host > Databases screen, and the dSource will also appear in the list of Datasets under its assigned group.

#### **The dSource configuration screen**

After you have created a dSource, the **dSource Configuration tab** allows you to view information about it and make modifications to its policies and permissions. In the **Datasets** panel, select the dSource you wish to examine. You can now choose the configuration tab to see information such as the **Source files**, **Data Management** configuration, and **Hook Operations**.

## Working with Db2 snapshots

Taking a snapshot creates a new snapshot entry in the dSource's Timeflow. The plugin-managed dSource allows you to select the parameters before taking the snapshot. These parameters are provided as an input to pre-snapshot and post snapshot functions. On the other hand, in the default snapshot, the parameters are pre-defined in the dSource environment.

### Snapshot (Default)

This section lists the steps to take a snapshot and delete the same.

1. Login to the **Delphix Management** application.
2. Click **Manage** and select **Datasets** from the dropdown list.
3. Select the dSource you want to Snapshot.
4. Click the **Camera** icon. Alternatively, click the arrow next to the Camera icon and select **Snapshot (default)**.
5. From the Snapshot dialog, select **Perform Snapshot**.
6. Click **View:** under **Timeflow** to verify the Snapshot you just created.
7. To delete, select the snapshot you just created, and from the Actions menu (...) select **Delete Snapshot**.
8. In the Delete Snapshot dialog, select **Delete**.
9. Click **View:** under **Timeflow** to verify the Snapshot, you just deleted.

## Source sizing implementation for datasets

The Source Sizing feature aligns the data source experience with Delphix database standards that will improve your ingestion reporting experience on the per TB pricing model. This feature enables you to calculate the dataset size based on the total allocated space on the mount point provided by the Delphix Engine for the dataset.

### Procedure

- For all datasets, the size of the dataset can be calculated using `du -sb <dataset>` command that provides the correct volume and apparent size of the datasets.
- For AIX hosts, the size of the dataset can be calculated by executing any one of the following commands depending on whether the database is open for connections or not.
  - a. `select sum(TBSP_TOTAL_SIZE_KB)*1024 from sysibmadm.TBSP_UTILIZATION,` if the database is open for connections and it is possible to connect to the database.
  - b. `db2dart <dbname> /DTSF`, if the database is not open for connections and is in rollforward pending state.

- For AIX hosts, the plugin won't be able to display the size of the database during the creation of dSource, since it needs to be restored to read the size of the database.
- If the plugin is unable to connect to the database or the database is yet to be restored, then the status tab under dSource displays **Not available**.

## Provisioning and managing VDBs from Db2 dSources

we do not support Migrate dataset option for DB2

 We currently **do not** support Migrate dataset option for DB2.

This section covers the following topics:

- [Provisioning Db2 VDBs: an overview](#)
- [Provisioning a Db2 VDB](#)
- [Database permissions for provisioned Db2 VDBs](#)
- [Upgrading Db2 VDBs](#)
- [Provisioning from a replicated Db2 VDB](#)

## Provisioning Db2 VDBs: an overview

This topic describes the basic concepts involved with provisioning VDBs from DB2.

A dSource is a virtualized representation of a physical or logical source database. As a virtual representation, it cannot be accessed or manipulated using database tools. Instead, you must create a virtual database (VDB) from a dSource snapshot. A VDB is an independent, writable copy of a dSource snapshot. You can also create VDBs from other VDBs. Once you have provisioned a VDB to a target environment, you can also implement snapshot and retention policies for the VDB, which will determine how frequently Delphix Engine will take a database snapshot and how long the snapshots will be retained for recovery and provisioning purposes. For an overview of the high-level components involved in provisioning a DB2 VDB refer to [Setting Up Db2 Environments: An Overview](#)

Snapshots accumulate over time. To view a snapshot:

1. From the Datasets panel, click the group containing the dSource.
2. Select dSource.
3. Click the TimeFlow tab.

The TimeFlow appears as a list of dates, each of which expands to show snapshots from that date. Times, when the VDB has been refreshed, are marked by a blue line between dates.

On the TimeFlow, you can also filter by type of snapshot. To do so, click the filter button, which is shaped like an eye.

You can scroll through these lists to select the one you want, or you can enter a date and time to search for a specific snapshot.

Once you have provisioned a VDB, you can also take snapshots of it. As with the dSource snapshots, you can find these when you select the VDB in the Datasets panel. You can then provision additional VDBs from these VDB snapshots.

### **Dependencies**

If there are dependencies on the snapshot, you will not be able to delete the snapshot free space; the dependencies rely on the data associated with the snapshot.

## Provisioning a Db2 VDB

This topic describes how to provision a virtual database (VDB) from a DB2 dSource.

### Prerequisites

- You will need to have linked a dSource from a staging instance, as described in [Linking a Db2 dSource](#), or have created a VDB from which you want to provision another VDB
- You should have set up the Db2 target environment with necessary requirements as described in [Requirements for Db2 Hosts and Databases](#)
- Make sure you have the required Instance Owner permissions on the target instance and environment as described in [Managing Db2 Users and Instance Owners](#)
- The method for [Database Permissions for Provisioned Db2 VDBs](#) is decided before the provisioning
- [Optional] Once you have restored the databases into your target environment, If the version of IBM® Db2® in your source environment is at a different fix pack level than the version of Db2 in your target environment, then you need to update the 11.1 version databases with `db2updv111` command and 11.5 databases with `db2updv115` command utility. Run the below command as a Pre-snapshot hook:

```
db2updv111 -d <DBNAME> -a
db2updv115 -d <DBNAME> -a
```

 The optional pre-requisite is applicable only when the target environment is using a different Db2 fix pack level than the source. If your source environment is using version 11.1.x and your target is using version 11.5.x, you can neglect the above-mentioned point.

Consider the following scenarios for the optional prerequisite mentioned above:

1. if your source environment uses Db2 version 11.5.5 and your target environment uses Db2 11.5.8 or a later fix pack, you need to update the databases in the target environment.
2. If your databases were created or upgraded to Db2 Version 11.1 GA and you applied Db2 Version 11.1 Fix Pack 1 or later, then running the above command will automatically apply all updates required from Version 11.1 GA up to and including the fix pack level that you are installing.

-  1. To know how to update databases, see [db2updv115 - Update database to Version 11.5 mod pack command](#)
2. Certain database or instance operations are restricted while an online fix pack update is in progress.
3. See [db2updv111 - Update database to Version 11.1 fix pack command](#), which mentions it is mandatory to run `db2updv111` on database if one is coming from higher version of fix pack to Lower OR vice versa.
4. For more information, you can also refer: [Update the databases for a Db2 11.1.x fix pack](#)

 You can take a new snapshot of the dSource by clicking the **Camera** icon on the dSource card. Once the snapshot is complete you can provision a new VDB from it.

**⚠ Please note while creating a VDB on an instance** By default, DB2 Plugin will not allow provisioning a VDB on an instance which contains a database that has an identical name to the source database.

For e.g.;

1. When we are provisioning a VDB from a VDB then source VDB will be treated as the source database.
2. When we are provisioning a VDB from a dSource then a staging database will be treated as the source database.

If the user wants to provision a VDB on an instance which contains a source database, then the user needs to follow the below steps :

1. Check if any config file with name db2\_plugin.conf at location <Toolkit directory>/Delphix\_COMMON/plugin/<Identifier>/. If it does not exist, then the user should create a file with name db2\_plugin.conf at location <Toolkit directory>/Delphix\_COMMON/plugin/<Identifier>/. The instance user must have read permission to this file. Once the file is created, user should proceed to step 2. If the file already exists at this location with the required permission, the user should directly proceed to step 2.
2. Add the below line in this config file.
  - a. allowSourceDbOnSameInstance=True
3. Then create/Refresh the VDB again.

#### Procedure

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Datasets**.
4. Select a **dSource**.
5. Select a **snapshot** from which you want to provision.
6. Click **Provision VDB** icon to open Provision VDB wizard.
7. Select a target environment from the left pane.
8. Select an **Installation** to use from the dropdown list of available DB2 instances on that environment.
9. Set the **Environment User** to be the Instance Owner. Note: The picking of instance owner is only possible if you have multiple environment users set on that host.
10. Provide VDB Name as database name as parameter.
11. Optionally, set the database configuration parameters for the VDB.
12. Click **Next**.
13. Select a **Target Group** for the VDB. Click the green **Plus** icon to add a new group, if necessary.
14. Select a **Snapshot Policy** for the VDB.
15. Click **Next**.
16. Specify any desired hook operations.
17. Click **Next**.
18. Review the **Provisioning Configuration** and **Data Management** information.
19. Click **Submit**. When provisioning starts, you can review the progress of the job in the **Databases** panel, or in the **Job History** panel of the **Dashboard**. When provisioning is complete, the VDB will be included in the group you designated and listed in the **Databases** panel. If you select the VDB in the Databases panel and click the **Open** icon, you can view its card, which contains information about the database and its Data Management settings. Once the VDB provisioning has successfully completed, if the source and target instance ids are not the same, you may want to grant secadm and dbadm on the database to the target instance id. Refer to [Database Permissions for Provisioned Db2 VDBs](#) for more information.

## Database permissions for provisioned Db2 VDBs

This topic describes the database permissions on provisioned Db2 virtual instances

### DB2 authentication

Authentication is the process of validating a supplied user ID and password using a security mechanism. User and group authentication is managed in a facility external to Db2 LUW, such as the operating system, a domain controller, or a Kerberos security system. This is different from other database management systems (DBMSs), such as Oracle and SQL Server, where user accounts may be defined and authenticated in the database itself, as well as in an external facility such as the operating system.

Any time a user ID and password is explicitly provided to Db2 LUW as part of an instance attachment or database connection request, Db2 attempts to authenticate that user ID and password using this external security facility. If no user ID or password is provided with the request, Db2 implicitly uses the user ID and password that were used to login to the workstation where the request originated. More information on Db2 authentication and authorization is available via [IBM documentation](#)

**Delphix Db2 Authentication** Delphix for Db2 requires that the staging and target hosts must already have the necessary users and authentication systems created/installed on them. Delphix will neither create users nor change database passwords as part of the provisioning process.

While the terminology used within the Delphix Management application refers to a VDB, the ingestion, snapshot and provisioning process for Db2 on Delphix always occurs on the Database level. Thus when a virtual Db2 database is provisioned by Delphix, it contains the Db2 database that were in the source instance with the identical user permissions as they had on the source. This means that if the target instance name is different from the source instance name then that instance owner will NOT have DBADM or SECADM permissions unless they were specifically granted to that instance owner on the source instance. The instance owner will however always have SYSADM permissions on all databases in the instance.

### LDAP authentication

If your Db2 instances and applications use LDAP authentication then they will work seamlessly as long as LDAP had been configured on the VDB Target Instance.

### OS authentication

If your DB2 instances and applications are using OS authentication then it is important to ensure that the relevant OS accounts exist on the target machine.

### Generic accounts

If the Db2 applications are using generic (non-instance owner) accounts, they will then be able to continue using them as long as those OS accounts exist on the host machine. It is important to note that the passwords for the same account may be different on different hosts, or if they use different LDAP servers (i.e. prod vs dev LDAP servers).

### Instance owner usage

If the Db2 applications typically use the instance owner accounts to access data then it is important to note that if the new instance name is different from the source instance name then that instance owner will NOT have DBADM or SECADM permissions in the VDB instance and may not be able to read and write data. In such a case there are three possible workarounds:

1. Connect to the databases as the source instance owner. This requires that the target host has a UNIX account with the same name as the source instance.

2. Grant the necessary permissions to the VDB instance owner on the source instance before taking the snapshot that is to be provisioned.
3. Grant the permissions to a known "delphix" user on the source instance and then use that account to grant the permissions to the target VDB instance after provisioning.

## Upgrading Db2 VDBs

This topic describes how to upgrade a Db2 VDB to a higher version of Db2.

 Before upgrading the VDB, please refer to the Delphix Db2 support matrix to ensure that you upgrade to the supported Db2 versions only.

### Procedure for VDB in-place upgrade

1. Remove any VDB Refresh Policy assigned to the VDB.
2. Upgrade the target Db2 instance.
3. Refresh the target environment.

## Provisioning from a replicated Db2 VDB

This topic describes how to provision from a replicated dSource or virtual database (VDB).

The process for provisioning from replicated objects is the same as the typical VDB provisioning process, except that first you need to select the replica namespace containing the replicated object.

### Prerequisites

- You must have a dSource or VDB that has been replicated from one Delphix Engine to another, as described in [Replication Overview](#)
- The Delphix Engine containing the replicated dSource or VDB must have a compatible target environment that it can use to provision a VDB from the replicated dSource or VDB.

### Procedure

1. On the Delphix Engine containing the replicated dSource or VDB, login to the **Delphix Management** application.
2. In the top menu bar, click **Manage**.
3. Select **Datasets**.
4. From the list of replica namespaces, select the **replica namespace** that contains the dSource or VDB from which you want to provision.
5. The provisioning process is now identical to the process for provisioning standard objects.

### Post-requisites

Once the provisioning job has started, the user interface will automatically display the new VDB in the live system.

## Db2 hook operations

### Shell operations

#### RunCommand operation

The RunCommand operation runs a shell command on a Unix environment using whatever binary is available at `/bin/sh`. The environment user runs this shell command from their home directory. The Delphix Engine captures and logs all output from this command. If the script fails, the output is displayed in the Delphix Management application and command-line interface (CLI) to aid in debugging.

If successful, the shell command must exit with an exit code of `0`. All other exit codes will be treated as an operation failure.

#### Examples of RunCommand operations

You can input the full command contents into the RunCommand operation.

```
remove_dir="$DIRECTORY_TO_REMOVE_ENVIRONMENT_VARIABLE"

if test -d "$remove_dir"; then
    rm -rf "$remove_dir" || exit 1
fi

exit 0
```

If a script already exists on the remote environment and is executable by the environment user, the RunCommand operation can execute this script directly.

```
/opt/app/oracle/product/10.2.0.5/db_1/dbs/myscript.sh "$ARG_ENVIRONMENT_VARIABLE"
"second argument in double quotes" 'third argument in single quotes'
```

#### RunBash operation

The RunBash operation runs a Bash command on a Unix environment using a `bash` binary provided by the Delphix Engine. The environment user runs this Bash command from their home directory. The Delphix Engine captures and logs all output from this command. If the script fails, the output is displayed in the Delphix Management application and command-line interface (CLI) to aid in debugging.

If successful, the Bash command must exit with an exit code of `0`. All other exit codes will be treated as an operation failure.

#### Example of RunBash operations

You can input the full command contents into the RunBash operation.

```
remove_dir="$DIRECTORY_TO_REMOVE_ENVIRONMENT_VARIABLE"
```

```
# Bashisms are safe here!  
if [[ -d "$remove_dir" ]]; then  
    rm -rf "$remove_dir" || exit 1  
fi  
  
exit 0
```

## Shell operation tips

### Using `nohup`

You can use the `nohup` command and process backgrounding from resource in order to "detach" a process from the Delphix Engine. However, if you use `nohup` and process backgrounding, you MUST redirect `stdout` and `stderr`.

Unless you explicitly tell the shell to redirect `stdout` and `stderr` in your command or script, the Delphix Engine will keep its connection to the remote environment open while the process is writing to either `stdout` or `stderr`. Redirection ensures that the Delphix Engine will see no more output and thus not block waiting for the process to finish.

For example, imagine having your `RunCommand` operation background a long-running Python process. Below are the bad and good ways to do this.

#### Bad examples

- `nohup python file.py & # no redirection`
- `nohup python file.py 2>&1 & # stdout is not redirected`
- `nohup python file.py 1>/dev/null & # stderr is not redirected`
- `nohup python file.py 2>/dev/null & # stdout is not redirected`

#### Good examples

- `nohup python file.py 1>/dev/null 2>&1 & # both stdout and stderr redirected, Delphix Engine will not block`

## Other operations

### RunExpect operation

The RunExpect operation executes an Expect script on a Unix environment. The Expect utility provides a scripting language that makes it easy to automate interactions with programs which normally can only be used interactively, such as `ssh`. The Delphix Engine includes a platform-independent implementation of a subset of the full Expect functionality.

The script is run on the remote environment as the environment user from their home directory. The Delphix Engine captures and logs all output of the script. If the operation fails, the output is displayed in the Delphix Management application and CLI to aid in debugging.

If successful, the script must exit with an exit code of 0. All other exit codes will be treated as an operation failure.

Example of a RunExpect operation

Start an ssh session while interactively providing the user's password.

```
spawn ssh user@delphix.com
expect {
  -re {Password: } {
    send "${env(PASSWORD_ENVIRONMENT_VARIABLE)}\n"
  }
  timeout {
    puts "Timed out waiting for password prompt."
    exit 1
  }
}
exit 0
```

### DB2 environment variables

Operations that run user-provided scripts have access to environment variables. For operations associated with specific dSources or virtual databases (VDBs), the Delphix Engine will always set environment variables so that the user-provided operations can use them to access the dSource or VDB.

#### dSource environment variables

Environment variable	Description
DLPX_DATA_DIRECTORY	The primary mount path provided by the user on the UI. The first one, in case multiple mount specifications are provided.
USER	The OS user used to create the dSource.

#### VDB Environment Variables

Environment variable	Description
DLPX_DATA_DIRECTORY	The primary mount path provided by the user on the UI. The first one, in case multiple mount specifications are provided.
USER	The OS user used to provision the VDB.

## Enhanced logging for Db2 Plugin

### DB2 plugin v3.x

This feature adds three options to provide enhanced logging:

1. To set debug log levels
2. To set log retention levels
3. To set trace size limit

Each host (added as an environment to DE) will have its own property file **<Toolkit directory>/DB2/plugin-logging.properties**. Delphix users can modify the parameters within this property file to configure the logging mechanism.

### Setting debug log levels

Delphix users can set log levels for plugin generated logs by setting the parameter **level**. Higher logging levels will help to expedite debugging issues. There are three levels of logging which are: Level 1 (info), Level 2 (debug) and Level 3 (trace). All the objects (both dSources and VDBs) present on a staging/target host will refer to a single property file. For example; if we have 4 dSources on a host associated with a Delphix Engine then the log level applies to all the dSources.

#### Log level description:

- level=1: This level will print only informational logs.
- level=2: This level will print informational logs and debug statements. This is the default log level.
- level=3: Besides informational and debug logs, this level will enable the traces.

### Setting log retention levels

Delphix users can set a retention level for diag logs (.diag.log)="" using="" parameter="">**retention** in the file. As per this parameter, the log files are moved (archived), renamed or deleted once they are too old or too big. New incoming log data is directed into a new fresh file (at the same location).

By default, this value will be set to a minimum value of 2. The user can change this value and set its value within the range 2 and 50. For example; if **retention** is set to 4, the plugin will have the following log files: <DB Name>.diag.log, <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB Name>.diag.log.4.

- File <DB Name>.diag.log is the active log file.
- File <DB Name>.diag.log.1 is the most recent archive log file
- File <DB Name>.diag.log.4 is the oldest one

### Setting trace size limit

In case trace level logging is enabled, users can set the size of the trace folder using parameter **traceFolderLimit**. By default, the value of this parameter will be 10, which signifies that the size limit for this folder will be 10 MB. This parameter is configurable and the user can set its value to any positive integer. The traces are stored within a separate folder for traces created under directory **<Toolkit directory>/DB2/logs/<User>/**. The filename format for traces would be <DB Name>.<script name>.trace.<epoch time>.

If the file is accidentally removed from the location, the plugin will generate the property file **<Toolkit directory>/DB2/plugin-logging.properties** with default values at runtime. For example, when the user will upload the plugin to DE, the first call to log function will check for the existence of **<Toolkit directory>/DB2/plugin-logging.properties**. If the plugin does not find this property file, it will create a property file with the content shown

below. The logs will start generating per the level defined inside the file. Below is the sample **<Toolkit directory>/DB2/plugin-logging.properties** file:

plugin-logging.properties

```
# This flag will set the debug level of logging. There are three levels:

# 1: Logging will be in info mode.

# 2: Logging will be in Debug mode.

# 3: Traces will be enabled along with debug level logging.

# The default value is 2.

# level=<positive integer>

level=2

# Whenever the size of <DB Name>.diag.log file exceeds 1MB the plugin will rename the
active log file to <DB Name>.diag.log.<number> and a new log file with name <DB
Name>.diag.log will be generated.

# For example, if LogRetention is set to 4, the plugin will have the following log
files: <DB Name>.diag.log, <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB
Name>.diag.log.3, <DB Name>.diag.log.4.

# File <DB Name>.diag.log.4 will be the oldest one.

# File <DB Name>.diag.log.1 will be the most recent archive log file.

# File <DB Name>.diag.log will be the active log file.

# For example, if LogRetention is set to 4, the plugin will have the following log
files: <DB Name>.diag.log, <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB
Name>.diag.log.3, <DB Name>.diag.log.4.

# The default value for retention flag is 2, minimum value is 2 and maximum value is
50.

# retention=<positive integer>

retention=2

# The value for this property is configurable and must be a positive integer.

# The default value is 10.

# traceFolderLimit=<positive number>

traceFolderLimit=10
```

## DB2 plugin v4.x and onwards

This feature adds three options to provide enhanced logging:

1. To set debug log levels.
2. To set active log file size.
3. To set log retention levels.

Delphix users can modify the parameters defined under `plugin_logging_parameters` section header within the `db2_plugin.conf` file located at `<Toolkit directory>/<Delphix_COMMON>/plugin/DB2_18f4ff11-b758-4bf2-9a37-719a22f5a4b8/db2_plugin.conf` to configure the logging mechanism.

### Setting log levels (level)

Delphix users can set log levels for plugin generated logs by setting the parameter **level** under `plugin_logging_parameters` header. Higher logging levels will help to expedite debugging issues. There are two levels of logging which are: Info and Debug. All the objects (both dSources and VDBs) present on a staging/target host will refer to a single property file. For example; if we have 4 dSources on a host associated with a Delphix Engine then the log level applies to all the dSources.

#### Log level description:

- level=INFO: This level will print only informational logs. This is the default log level.
- level=DEBUG: This level will print informational logs and debug statements.

### Setting maximum size of active log file (logFileSize)

Delphix users can set this parameter under the `plugin_logging_parameters` header of the `db2_plugin.conf` file to set the maximum size of the active log file in MB. Once this limit is reached, the plugin will rotate the log as per the retention property defined below. The minimum value of this parameter is 1 MB and maximum value is 10 MB. This parameter only takes in a positive integer value. The default value is 1 MB.

### Setting log retention levels (retention)

Delphix users can set a retention level for diag logs (`.diag.log`)="" using="" parameter="">**retention** under the `plugin_logging_parameters` header. As per this parameter, the log files are moved (archived), renamed or deleted once they reach the value set in `logFileSize` parameter. New incoming log data is directed into a new fresh file (at the same location).

By default, this value will be set to a minimum value of 2. The user can change this value and set its value within the range 2 and 50. For example; if **retention** is set to 4, the plugin will have the following log files: `<DB Name>.diag.log`, `<DB Name>.diag.log.1`, `<DB Name>.diag.log.2`, `<DB Name>.diag.log.3`, `<DB Name>.diag.log.4`.

- File `<DB Name>.diag.log` is the active log file.
- File `<DB Name>.diag.log.1` is the most recent archive log file
- File `<DB Name>.diag.log.4` is the oldest one

`db2_plugin.conf`

```
#
# The parameters must not be left padded with spaces. The plugin will otherwise not
# accept the specified parameter
# values and will use the default values.
#

[plugin_custom_parameters]
#
# If the user has not shared a common group between primary environment user and
# instance user.
```

```
# Then the user needs to set parameter usersHaveCommonGroup as False.
#
usersHaveCommonGroup=True

#
# During provision operations the plugin checks if the target instance contains a
database name which is identical to
# the source DB name from which the VDB is to be created. By default the plugin will
never allow creating a VDB on the
# instance where the source database already exists, or on any instance that has a
database with the same name. If the
# users still want to create a VDB on an instance which contains a database with the
same name as the source DB then
# they need to set parameter allowSourceDbOnSameInstance as True.
#
allowSourceDbOnSameInstance=False

#
# If the users want to control the number of parallel restores then they can tune the
parameter restorePipelineLimit.
# By default the value of this parameter would be 10.
#
restorePipelineLimit=10

[plugin_logging_parameters]
#
# This flag will set the debug level of plugin logs on the remote server (both
staging and target). There are two levels:
# Info
# Debug
# The above are the only valid values that can be assigned. If any other value is
assigned, the plugin will set the
# default level as Info. the string is case insensitive so info, Info and INFO are
acceptable.
#
level=INFO

#
# This parameter will set the maximum size of the active log file in MB. Once this
limit is reached, the plugin will
# rotate the log as per the retention property defined below. The minimum value of
this parameter is 1 MB and maximum
# value is 10 MB. This parameter only takes in a positive integer value. The default
value is 1 MB
# logFileSize=<positive integer>
#
logFileSize=1
```

```
#  
# Whenever the size of <DB Name>.diag.log file exceeds the value provided by  
# logFileSize parameter then the plugin will  
# rename the active log file to <DB Name>.diag.log.<number> and a new log file with  
# name <DB Name>.diag.log will be  
# generated. For example, if LogRetention is set to 4, the plugin will have the  
# following log files: <DB Name>.diag.log,  
# <DB Name>.diag.log.1, <DB Name>.diag.log.2, <DB Name>.diag.log.3, <DB  
# Name>.diag.log.4.  
# File <DB Name>.diag.log.4 will be the oldest one.  
# File <DB Name>.diag.log.1 will be the most recent archive log file.  
# File <DB Name>.diag.log will be the active log file.  
# The minimum and default value for retention flag is 2.  
# retention=<positive integer>  
#  
retention=2
```

## Quick start guide for MySQL

MySQL connector has been developed to ingest and virtualize MySQL data sources using Delphix.

### What does MySQL connector do?

The Delphix MySQL connector can virtualize a single instance MySQL database and create multiple virtual copies as required. There are two modes of operation of the connector based on how the MySQL dSource is created and kept in-sync with source database.

#### Replication with bin log

In the Replication with binlog mode, Delphix uses MySQL's built-in replication with binlog technology to keep the Delphix dSource in-sync with the MySQL source databases. Creation of the dSource requires a full backup of the source database(s) and there are two options to provide this backup.

1. **Delphix Managed Backup** In this option, Delphix is provided with the required information and privileges to take a full backup of the source database.
2. **User Provided Backup** In this option, user provides Delphix with an existing full backup. Delphix initializes the staging database using the full backup and configures the staging database as a replicated slave of the source database. MySQL Replication with binlog keeps the data in the staging database in-sync with the source.

#### Manual Ingestion

In the Manual Ingestion mode, the data in Delphix dSource is managed manually by the end users. Delphix creates a seed MySQL staging database which can be managed via Delphix. The end user assumes the responsibility of keeping the data in the staging database in-sync with the source database.

### Where to start?

By now, you must have an overall idea of what is possible with the MySQL plugin. Before you can get started with virtualizing your MySQL databases, there are some pre-requisites you need to take care of. Please visit the [Pre-Requisites](#) page for more details.

### Questions?

If you have questions, bugs or feature requests reach out to us via the [MySQL Github](#) or at [Delphix Community Portal](#).

## General prerequisites

Given below are the general pre-requisites for MySQL virtualization.

### Environments

For MySQL virtualization, Delphix requires only Staging and Target Hosts to be added as environments.

Refer to [Delphix Docs](#) for configuration best practices.

### Staging Host/Environment

The MySQL connector is a "Staged" connector - which means that in order to create a dSource, Delphix requires a staging environment. This environment must have MySQL binaries installed and the version of MySQL must match the source MySQL database(s).

### Target Host/Environment

If you are familiar with Delphix, you must already know what a Target Host is. It is simply another host with MySQL binaries installed where Delphix creates virtual databases. Again, the version of MySQL must match your source database(s).

### Storage

- Empty folder on Staging & Target host to hold delphix toolkit [ approximate 2GB free space ]
- If Delphix is managing backups, the Staging Host must have enough storage space to hold your source database backup.

### MySQL Version

- MySQL Binary version on Staging and Target must match the version on the source database(s)

## Environment requirements for replication with bin log as an ingestion mechanism

Given below are the pre-requisites for MySQL virtualization when using Replication with binlog mode.

### Source environment requirements

Source environment is where the source MySQL databases are running.

### Connectivity

Delphix staging user must be able to connect to source environment from staging and take a backup of the source database(s) using the *mysqldump* utility.

### Source DB user

- A Source DB user with the following permissions.
  - Can connect to the source database from staging host as well as locally. This user is required to take backup of the source database.

```
mysql>CREATE USER 'delphix_os'@'<staging_host>' IDENTIFIED BY 'delphix_user_passwd';
```

```
mysql>CREATE USER 'delphix_os'@'localhost' IDENTIFIED BY 'delphix_user_passwd';
```

- Has at the minimum, the following permissions on the source database(s).

SELECT, SHUTDOWN, SUPER, RELOAD ,SHOW VIEW, EVENT, TRIGGER, REPLICATION CLIENT,REPLICATION SLAVE

```
mysql>GRANT SELECT, SHUTDOWN, SUPER, RELOAD ,SHOW VIEW, EVENT, TRIGGER, REPLICATION
CLIENT,REPLICATION SLAVE on *.* to 'delphix_os'@'staging-host';
```

```
mysql>GRANT SELECT, SHUTDOWN, SUPER, RELOAD ,SHOW VIEW, EVENT, TRIGGER on *.* to
'delphix_os'@'localhost';
```

You can also grant more permissive privileges

```
mysql>GRANT ALL PRIVILEGES ON *.* TO 'user'@'%';
```

### Note

Remember, this is the user that Delphix uses to manage the Staging database. So, it is recommended that you create a dedicated source db user for Delphix with the privileges mentioned above.

### Binary logging

- In order to set up replication, binary logging should be enabled on the source database. You can check the status of binary logging as follows

```
mysql> SHOW VARIABLES LIKE 'log_bin';
```

If binary logging is enabled, you should see the following status

```
+-----+-----+
| Variable_name | Value |
+-----+-----+
| log_bin      | ON   |
+-----+-----+
```

### Server-Id

The source database must have a non zero server-id and the server-id value should be different than the server-id value on the source.

### Staging environment requirements

#### Staging OS user

This is a typical Delphix OS staging user. Key requirements for this user are given below.

Please refer to Delphix Docs for more detailed requirements.

- A Delphix OS user with the elevated permissions to run ps, mount, umount, mkdir, rmdir commands without requiring a password. Below is an example where delphix\_os will be used for the mounting purpose.

```
/etc/sudoers
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir, /bin/ps
```

- Delphix OS user should be in the same primary and secondary groups as mysql user ( or the MySQL binary owner )
- Delphix OS user must have execute access on all files within MySQL installation folder - Min permission level 775 recommended.

### Storage

- Staging Host must have enough storage space to hold the source backup file.
- Empty folder on staging host to hold delphix toolkit [ approximate 2GB free space ]

### MySQL version & configuration

- MySQL Binary version must match the version on the source database(s)
- [Recommended] As every organization's MySQL configuration is different, User can place a starter my.cnf file to be present in Delphix Toolkit Directory when creating a staging database. Delphix will use this my.cnf file and modify it as per the configuration provided during the dsource creation process. This is recommended to reduce the possibility of errors while restoring the backup from the source database. However, having the my.cnf in the toolkit directory is not mandatory. Connector has the ability to create my.cnf file on its own.

## Target environment requirements

### Target OS user

This is a typical Delphix OS target user. Key requirements for this user are given below.

Please refer to Delphix Docs for more detailed requirements.

- A Delphix OS user with the elevated permissions to run `ps`, `mount`, `umount`, `mkdir`, `rmdir` commands without requiring a password. Below is an example where `delphix_os` will be used for the mounting purpose.

```
/etc/sudoers
```

```
Defaults:delphix_os !requiretty
```

```
delphix_os ALL=NOPASSWD: \
```

```
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir, /bin/ps
```

- Delphix OS user should be in the same primary and secondary groups as `mysql` user ( or the MySQL binary owner )
- Delphix OS user must have execute access on all files within MySQL installation folder - Min permission level 775 recommended.

Done, what's next?

All the pre-requisites are now taken care of, next step is to [install the connector](#).

## Environment requirements for manual ingestion

Given below are the pre-requisites for MySQL virtualization when using Manual Ingestion mode.

### Source environment requirements

Source environment is where the source MySQL databases are running.

### Source DB user

In Manual Ingestion mode, Delphix does not interact with the source database. Delphix creates a staging database and the backups are ingested manually by a customer user. However, Delphix needs to be able to manage this staging database for snapshots and other time travel operations. Hence, we require a user with the following permissions on the staging database.

SELECT, SHUTDOWN, SUPER, RELOAD ,SHOW VIEW, EVENT, TRIGGER

This can be achieved by following:

1. Create this user on your source database so that when the backup is restored, this user is present on the staging database.
2. Plugin will attempt to create this user and assign the required privileges on the staging database during the dSource creation. Plugin will fail if it is not able to create this user or assign the required permissions on the staging DB. User needs to ensure that this user is always present in the staging database and has the necessary privileges. This is required as delphix will use this user to perform any time travel operations.

```
PowerShell
mysql>CREATE USER 'delphix_os'@'localhost' IDENTIFIED BY 'delphix_user_passwd';
```

3. Grant the necessary privileges to the user.

```
mysql> GRANT SELECT, SHUTDOWN, SUPER, RELOAD ,SHOW VIEW, EVENT, TRIGGER on *.* to
'delphix_os'@'localhost';
```

You can also grant more permissive privileges

```
mysql>GRANT ALL PRIVILEGES ON *.* TO 'user'@'%';
```

#### Note

Remember, this is the user that Delphix uses to manage the Staging database. So, you need to create this user on the source database.

### Staging environment requirements

#### Staging OS user

This is a typical Delphix OS staging user. Key requirements for this user are given below.

- A Delphix OS user with the elevated permissions to run ps, mount, umount, mkdir, rmdir commands without requiring a password. In the example below permissions are provided to delphix\_os user.

```

/etc/sudoers
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir, /bin/ps

```

- Delphix OS user should be in the same primary and secondary groups as mysql user ( or the MySQL binary owner )
- Delphix OS user must have execute access on all files within MySQL installation folder - Min permission level 775 recommended.

## Storage

- Empty folder on staging host to hold Delphix toolkit [ approximate 2GB free space ]

## MySQL version & configuration

- MySQL Binary version must match the version on the source database(s)
- Starter my.cnf file [Recommended]
  - As every organization's MySQL configuration is different, User can place a starter my.cnf file to be present in Delphix Toolkit Directory when creating a staging database.
  - Delphix will use this my.cnf file and modify it as per the configuration provided during the the dsource creation process.
  - This is recommended to reduce the possibility of errors while restoring the backup from the source database.
  - Having a my.cnf in the toolkit directory is not mandatory, if this file is not provided, Delphix will create a my.cnf file from scratch.

## Target environment requirements

### Target OS user

This is a typical Delphix OS target user. Key requirements for this user are given below.

Please refer to Delphix Docs for more detailed requirements.

- A Delphix OS user with the elevated permissions to run ps, mount, umount, mkdir, rmdir commands without requiring a password. In the example below permissions are provided to delphix\_os user.

```

/etc/sudoers
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir, /bin/ps

```

- Delphix OS user should be in the same primary and secondary groups as mysql user ( or the MySQL binary owner )
- Delphix OS user must have execute access on all files within MySQL installation folder - Min permission level 775 recommended.

## Done, what's next?

All the pre-requisites are now taken care of, next step is to [install the connector](#).

## MySQL connector support/compatibility matrix

### MySQL connector support/compatibility matrix

Delphix Engine Version	Connector Version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0
6.0.4 to 6.0.6.0	Y	Y	N	N	N
6.0.7.0 to 6.0.16.0	N	N	Y	N	N
6.0.16 and above	N	N	Y	Y	Y

Supported DBMS Version	Connector Version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0
MySQL Community 5.7.x	Y	Y	Y	Y	Y
Percona Server 5.7.x	N	N	N	Y	Y
MySQL Community 8.0.x	N	N	N	N	Y
Percona Server 8.0.x	N	N	N	N	Y

### Supported operating system

Supported OS Version	Connector Version				
	1.0.0	2.0.26	2.1.0	3.0.0	4.0.0
RHEL 6.9 / 7.x	Y	Y	Y	Y	Y

 Future releases may add support for additional versions.

## Compatibility limitations

The following functionalities are not supported:

- Pull-based ingestion mechanism using Backup & Recovery.
- Pull-based ingestion mechanism using replication, except Binary Log ( binlog ).
- Pull-based ingestion mechanism using only backups is not supported.
- Partitioning of the databases.
- Selective replication of databases during dSource creation.
- Windows Operating System

## MySQL connector installation

### Prerequisites

- Delphix Engine of version 6.0.x
- Install MySQL Binaries on source, staging, and target servers

### Installing the MySQL connector

#### Method 1: Using GUI

- Click on **Manage** (present on top-left of the below page) and then **Plugins**.

- Click on plus (+) icon.

- Click on **Upload** a plugin.

## Plugins

Filter: none

Pretty Name	Version	Namespace
Unstructured Files	1.0.0	

- Select the `build(artifacts.json)` from your device.

### Upload or Upgrade a Plugin

Upload a plugin file to add new plugins in this engine or to upgrade an existing one.

#### Upload Status

File not selected

Close

- Click on **Close** button.

- See the plugin version in **Plugins** section.

## Method 2: using dvp command

```
dvp upload -e <Delphix_Engine_Name> -u <username> --password <password>
```

Delphix Engine's documentation on installing plugins: [Plugin Management](#).

## MySQL environment discovery

Environment discovery/refresh is a process that enables the MySQL Plugin to determine MySQL installation details on a host. Database discovery/refresh is initiated during the environment set up process.

Whenever there is any change (installing a new database home) to an already set up environment in the Delphix application, we need to perform an environment discovery/refresh.

### Prerequisites

Installation of the MySQL Plugin is required before the Discovery.

### Refreshing an environment

Environment refresh will update the metadata associated with that environment and push Delphix Toolkit onto the host.

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. In the Environments panel, click the name of the environment you want to refresh.
5. Select the **Refresh** icon.
6. In the Refresh confirmation dialog select **Refresh**.

Once an environment refresh completes successfully, Delphix will discover all MySQL installations on the environment. These installations are referred to as "repositories".

### Add source config

As noted above, environments contain `repositories`, that are MySQL installations in the environment. Each environment may have any number of repositories associated with it.

The next step in the virtualization process is to add a `SourceConfig`. A `SourceConfig` object defines the configuration of the dSource and is required to create a dSource. You can create any number of `SourceConfig` objects using a repository, which represents known database instances.

For the MySQL plugin, the Source config must be created manually.

How to create source configs

**Note**  
Source Config is created on the Staging Environment

1. Login to the **Delphix Management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select the repository.
5. Click on plus( + )icon.

6. Add required details in the **Add database** section.
  - Enter source data directory in section **Data Directory**.
  - Enter source port number in **Port** section.
  - Enter MySQL base directory on the source host in **Base Directory** section.
  - Enter dSource name in **MySQL dSource Name** section.

## Add Database

Data Directory \*

**/var/lib/mysql**

Full path of the MySQL DB data directory (include the data directory)

Port \*

**3306**

Port for the MySQL database

Base Directory \*

**/usr**

Path of the MySQL Installation, where binaries (/bin) is located

MySQL Instance Name \*

**mysql-source**

Name of the MySQL Instance.

Cancel

Add

### What's next?

Now that your environments are all added and a Source Config has been created, please proceed to [Linking Data Sources with MySQL](#) to see how to create a dSource.

## Linking Data Sources with MySQL

## Linking using replication with bin log mode

In Replication Mode, Delphix creates a staging database using an initial backup from the source database. This initial backup can be taken by Delphix or can be provided by the end user. In order to ensure that the staging database remains in-sync with the source database, Delphix can set up a MySQL native replication from the sourcedatabase to the stagingdatabase.

### Pre-requisites

- Staging environment must be added to Delphix.
- A Source Config must be created on the staging environment-MySQL repository.

This is recommended to reduce the possibility of errors while restoring the backup from the source database.

### Warning

It may take upto 5 minutes after successful dSource creation for the status to show as Active.

## Creating dSource

1. Login to **Delphix Management** application.
2. Click **Manage > Datasets**.
3. Select **Add dSource**.
4. In the **Add dSource** wizard, select the MySQL source configuration which is created on the staging host.
5. Select **Replication** from the **dSource Type** dropdown.

6. Provide the additional details required for dSource creation
  - a. **Staging DB Server ID** Server ID for the dsouce (staging db. For Replication Mode, this server id must be greater than the source db server id.
  - b. **Staging DB Port** Port for the dsouce (staging db). This port should not be used by any other application or MySQL server.
  - c. **Staging Initialization Password** Password to use while initializing the dsouce (staging db). This password will be assigned to the 'root'@'localhost'. We need to provide Password of the root user

- over source. Delphix does not connect to the source db using the root user. Source root user password will be inherited for this instance once the data ingestion starts.
- d. **MySQL Base Directory** MySQL installation directory. This generally has location of /bin/mysql
  - e. **Mount Location on Staging Host** This is the mount directory for Delphix on the staging host. This location should be unique and empty.
  - f. **Source DB Host IP Address** IP Address of the source db host.
  - g. **Source DB UserName** Delphix database user on the source database. This user will be created in the dsource when the initial backup is created or restored. If the backup generation over source is driven by Delphix, then Delphix will be using the Source DB UserName to connect to the source database. Delphix will be using this db user to manage the dSource and other time travel operations.
  - h. **Source DB Password** Password for the source database user.
  - i. **Databases List** Selective database replication is not supported. Leave blank or fill in as ALL which indicates that all databases on the source instance will be brought in.
  - j. **MySQL Backup Path** Full path, including the filename, of the full source db backup to use for the dsource creation. If this is provided, Delphix will not create a backup.
  - k. **LogSync** Whether to enable replication or not. If checked, Delphix will set up the dsource (staging db) as a replicated slave of the source database.
  - l. **Replication UserName** Delphix DB user with replication privileges to set up replication from source to staging db. Currently, Delphix uses the Source DB user for replication.
  - m. **Replication User Password** Password for the replication database user.
7. On **dSource Configuration** screen, select the dataset group where the dSource will be placed and click **Next**.
  8. On the **Data Management** screen, select the staging environment and the environment user and click **Next**.
  9. On the **Policies** screen, select the Snapsync and Retention policies for the dSource and click Next.
  10. On the **Hooks** screen, add any pre-sync and (or) post-sync hooks as required and click Next.
  11. Review the dSource configuration on the **Summary** screen and **Submit**. The Linking process has commenced.

Done, what's next?

You have created a MySQL dSource. Next step - [Provision a VDB](#).

## Linking using manual ingestion mode

In Manual Ingestion Mode, Delphix creates a seed (empty) staging database. Customer users will be responsible for manually ingesting data into this staging database. All other management operations can be performed through Delphix. A snapshot can be taken either manually or via a SnapSync policy once the data is restored into the seed staging database.

### Info

While ingesting the data for Manual Backup Ingestion, make sure to ingest the data on the MySQL instance which has been created as a part of dSource creation.

### Pre-requisites

- Staging environment must be added to Delphix.
- A Source Config must be created on the staging environment-MySQL repository.

This is recommended to reduce the possibility of errors while restoring the backup from the source database.

### Warning

It may take upto 5 minutes after successful dSource creation for the status to show as Active.

### Creating dSource

1. Login to **Delphix Management** application.
2. Click **Manage > Datasets**.
3. Select **Add dSource**.

4. In the **Add dSource** wizard, select the MySQL source configuration which is created on the staging host.
5. Select **Manual Ingestion** from the **dSource Type** dropdown.
6. Provide the additional details required for dsource creation
  - a. **Staging DB Server ID**  
Server ID for the dsource stagingdatabase.
  - b. **Staging DB Port**  
Port for the dSource (stagingdatabase). This port should not be used by any other application or MySQL server
  - c. **Staging Initialization Password**  
Password to use while initializing the dSource (stagingdatabase). This password will be assigned to the `root'@'localhost`. We need to provide Password of the root user over source at the time of backup initiation. While Linking using the Manual Ingestion Mode, Delphix does not connect to the source db. Source root user password will be inherited for this instance once the data ingestion starts onto the staging instance.

- d. **MySQL Base Directory** MySQL installation directory. This generally has location of /bin/mysql
  - e. **Mount Location on Staging Host** This is the mount directory for Delphix on the staging host. This location should be unique and empty.
  - f. **Source DB UserName**  
Delphixdatabase user on the source database. In Manual Ingestion mode, Delphix does not connect to the sourcedatabase. Delphix will be using thisdatabase user to manage the dSource and other time travel operations. This user must be part of the sourcedatabase backup that will be restored into the stagingdatabase. Plugin will also attempt to create this user on the staging database and provide the necessary permissions.
  - g. **Source DB Password**  
Password for the sourcedatabase user.
7. On **dSource Configuration** screen, select the dataset group where the dSource will be placed and click **Next**.
  8. On the **Data Management** screen, select the staging environment and the environment user and click **Next**.
  9. On the **Policies** screen, select the Snapsync and Retention policies for the dSource and click **Next**.
  10. On the **Hooks** screen, add any pre-sync and (or) post-sync hooks as required and click **Next**.
  11. Review the dSource configuration on the **Summary** screen and **Submit**. The Linking process has commenced.

Once the dSource creation is successful, the **Timeflow** tab should show the initial snapshot.

Done, what's next?

You have created a MySQL dSource. Next step - [Provision a VDB](#).

## Provisioning VDBs from MySQL dSources

Virtual Databases (VDB) are virtualized copies of dSource. A VDB can be created using a snapshot on the dSource timeflow.

### Prerequisites

- Require a linked dSource with at least 1 snapshot.
- Require a Target environment added to Delphix.
- A MySQL binary with the same version as the source database must be installed on the Target environment.

#### Warning

It may take upto 5 minutes after successful dSource creation for the status to show as Active.

### Provisioning a VDB

1. On the dSource Timeflow, click on the Provision action on the snapshot that you want to use for the VDB as shown below.

2. Select the target host from the dropdown on which VDB needs to be created. If there are multiple MySQL repositories on the host, select the one that matches the source database version. If there are multiple OS users on the host, select the user you want to use.

#### Provision vFiles

3. Enter the following values for the target configuration:
  - a. **DB User** This is the database user for the VDB. Delphix will use this user to manage the VDB. User needs to provide the same user account that was used by the staging database.
  - b. **DB Password** Password for the VDB database user.
  - c. **BaseDir** MySQL installation directory. This is the location of `/bin/mysql`

- d. **VDB Port** MySQL database port for the VDB. This port should not be used by any other application or MySQL server
- e. **VDB Server ID** MySQL server id for the VDB. This server-id must be non-zero.
- f. **Mount Location** This is the mount directory for Delphix VDB on the Target host. This location should be unique and empty.

Provision vFiles

**Target Configuration**  
Configure the target environment.

DB User \*  
delphixdb

DB user for the virtual database

DB Password \*  
.....

DB user password for the virtual database

BaseDir \*  
/usr

Path of the MySQL Installation, where binaries (/bin) exists

VDB Port \*  
3308

Port for the MySQL VDB

VDB Server ID \*  
201

Server ID for the MySQL VDB

Mount Location \*  
/mnt/provision/mysql\_vdb

Unique NFS Mount folder for Delphix

4. On **Configuration** screen, add VDB name, select **Target Group**, check **Auto vFiles Restart** checkbox and click **Next**

Provision vFiles

**Configuration**  
Name the vFiles and assign to a group.

vFiles Name  
couchbasetgt

Target Group [Add Dataset Group](#)  
Couchbase VDBs

Auto vFiles Restart  Enabled

- 5. On the **Policies** screen, add any required policies and click Next.
- 6. If you want to Mask the VDB, select the required configuration on this screen and click Next.
- 7. On the **Hooks** screen, add any required Hooks and click Next.
- 8. Preview the summary and click **Submit**.

Once the VDB is created successfully, you can review the datasets on **Manage > Datasets > VDB Name**. You have now provisioned a MySQL VDB.

## MySQL plugin exit codes

Detailed below are the exit codes that the MySQL Plugin throws if an error occurs.

Code	Description	Possible Reason
1	General Error	Check logs
2	General Error	Check logs
3	Unable to start MySQL	<ol style="list-style-type: none"> <li>1. Delphix user does not have the necessary permissions on the host</li> <li>2. Mount location provided is in use</li> <li>3. Database credentials provided are not accurate</li> <li>4. Invalid server-id</li> <li>5. Provided port is not in use</li> </ol>
4	Missing config file	A <code>my.cnf</code> file was not provided and Delphix was unable to create one.
5	Unable to change <code>root</code> password	<p>Delphix was unable to change the password for the root user after creating the staging db.</p> <p>Please check logs.</p>
6	Unable to restore backup	Delphix was unable to restore the full backup into staging db. Please check logs.
7	Connect failure post restore	<p>Delphix is unable to connect to staging database after backup is restored.</p> <ol style="list-style-type: none"> <li>1. The Source DB username and password provided may be incorrect.</li> <li>2. The MySQL Database did not restart after the restore.</li> </ol> <p>Check logs for more information on the error.</p>
8	Delphix backup failure	<p>Delphix could not take a source database backup.</p> <ol style="list-style-type: none"> <li>1. Staging Host may not be able to connect to Source Host</li> <li>2. Source DB credentials may be incorrect</li> <li>3. Source DB user may not have the required permissions</li> <li>4. Databases provided in the list may not be present on the source MySQL instance.</li> </ol> <p>Check logs for more information on the error.</p>

Code	Description	Possible Reason
9	Customer backup failure	<p>There was an issue with the customer provided backup.</p> <ol style="list-style-type: none"><li>1. Backup location may not exist.</li><li>2. The backup file may not exist</li><li>3. Backup file may be empty.</li></ol> <p>Check logs for more information on the error.</p>
10	Invalid binary path	<code>mysql</code> was not found under the provided installation directory.
11	Connect failure after restart	<p>In Backup Ingestion Mode, the Delphix source user could not connect to the MySQL instance after reboot.</p> <p>Check logs for more information on the error.</p>
12	Unable to create user	<p>In Backup Ingestion Mode, there was an error while creating the delphix user after staging db was initialized.</p> <p>Check logs for more information on the error.</p>

## Troubleshooting

If you run into an error while using the MySQL plugin and have an exit code in the error, refer to [ExitCodes](#) for further information.

### Logs

There are 2 sets of logs for the MySQL plugin

1. Plugin Logs Plugin logs are part of the Delphix Engine. Refer to [How to Retrieve Logs] (<https://developer.delphix.com/References/Logging/#how-to-retrieve-logs>) to find out how to get the Delphix Plugin Logs.
2. MySQL Shell Operation Logs When the plugin performs certain operations ( such as Take backup, Link, Provision etc), logs are written to log files on the staging or target host under the Delphix Toolkit directory

Following are the logs to review

- *delphix\_mysql\_debug.log*
- *delphix\_mysql\_info.log*
- *delphix\_mysql\_error.log*

### Common MySQL commands

- Connecting to a MySQL instance

```
delphixos> /usr/bin/mysql -uUserName -pPassword --protocol=TCP --port=1234
```

- List databases in MySQL

```
mysql> show databases;
```

- Check replication status in MySQL

```
mysql> show slave status;
```

- Check binary logging

```
mysql> SHOW VARIABLES LIKE 'log_bin';
```

- Check user permissions

```
mysql> show grants for 'delphixdb'@'%';
```

## Oracle environments and data sources

This section covers the following topics:

- [Delphix architecture with Oracle](#)
- [Transparent data encryption and Delphix](#)
- [Oracle environment management](#)
- [Quick start guide for Oracle on Linux](#)
- [Quick start guide for Oracle on Solaris SPARC](#)
- [Oracle support and requirements](#)
- [Managing Oracle environments and hosts](#)
- [Linking data sources and syncing data with Oracle](#)
- [Provisioning and managing virtual databases with Oracle](#)
- [Oracle hook operations](#)

## Delphix architecture with Oracle

### Overview

Various Oracle configurations ranging from Oracle RAC to Oracle multi-tenant can be used with Delphix. This article contains an overview of how Delphix works with Oracle.

There are three key concepts when using Delphix with any data platform:

1. **Environments:** The server and software required to run a data set. For Oracle, this will be an operating system host with Oracle instances running on it.
  - a. **Source Environment:** Source data to be ingested into Delphix. These will be used to create dSources.
  - b. **Target Environment:** Target hosts to provision VDBs. These need Oracle installations that correspond to the versions of the Source environments, per our [Oracle support matrix](#)
2. **dSources:** A database that the Delphix Virtualization Engine uses to create and update virtual copies of your database
3. **VDBs:** A database provisioned from either a dSource or another VDB which is a copy of the source data. A VDB is created and managed by the Delphix Virtualization Engine.

With these concepts in mind, explore how Delphix connects to Oracle environments and creates Oracle dSources and VDBs.

Delphix is not a replacement for an archived log backup solution and should not be relied on to do so. This can cause issues where Delphix is unable to start a vPDB that was plugged into a physical CDB if Delphix is having to determine and deliver the archived logs. You will need to find a separate archived log backup solution workflow to own and be responsible for physical CDB archived logs.

### Environment linking and provisioning architecture

As shown in the diagram below, there are two ways by which Delphix Engine can ingest data from an Oracle dSource.

### Source based ingestion

In this method, Delphix Engine begins by ingesting data from your source databases in order to create dSources. Once an environment is added, Delphix Engine will automatically ‘discover’ databases on it, which are compatible to ingest from, to create new dSources.

When a dSource is to be added, we will leverage RMAN and JDBC to create snapshots of the source by taking a full database backup. The newer snapshots take incremental backups of the database to ingest incremental data between snapshots. SnapSync and LogSync policies can be leveraged for automated snapshots. The result is a TimeFlow with various snapshots from which you can provision a VDB.

### Staging push ingestion

Staging Push introduces the concept of a staging instance for Oracle dSource ingestion. Storage for the staging instance is provided by the Delphix Engine via NFS. The staging database can be populated with production data after which a dSource Snapshot can be taken.

The staging database needs to be active only while taking dSource snapshots. It can be shut down after the snapshot to save system resources on the Staging host. Pre-sync and Post-sync hooks can be used to populate the staging database with production data before taking snapshots.

When you later provision a VDB, you can specify any environment as a target, including the environment that contains the source/staging database. However, we recommend choosing a different target environment for the best performance. It must have an operating system that is compatible with the one running on the source/staging environment.

## Transparent data encryption and Delphix

### Overview

The Oracle Transparent Data Encryption feature encrypts the sensitive data (database tables and tablespaces) stored on the disk. This prevents misuse of the data if the disks or storage mediums are lost or stolen. The data is transparently decrypted for the authorized users when they access the data.

Data is encrypted with the help of encryption keys which are stored in an external module or file, known as the *wallet* or *keystore*. The keystore is managed by an authorized user and can be either a hardware or software keystore. In order to decrypt the data successfully, the encryption keys must be made available to the database by the authorized user.

In the Oracle database, the data is organized into tables that are located within a tablespace, which is in turn made up of one or more files on disk. With TDE either individual tables or an entire tablespace can be encrypted. The keys used to encrypt the data are stored within the database itself, in the data dictionary. The keys themselves are further encrypted using the wallet keys. By using 2 layers of encryption in this manner, access to all of the encrypted data can be achieved with just access to the keys in the keystore.

In the remainder of this document, the term *key* will refer to the master key stored in the external keystore, rather than the table keys stored in the data dictionary. In the case of a multi-tenant database, the same principle applies, namely that the keys are stored in the keystore which is located external to the database. However, not all of the PDBs within the container need to be encrypted. The CDB itself must always have a key associated with it, even if the CDB datafiles themselves are not encrypted. This is the case because Oracle will encrypt both the datafiles belonging to the PDB, as well as the archive logs, which are located in the CDB, as illustrated in the following diagram.

In the diagram below, PDBs 1 and 2 are encrypted, but PDB 3 is not. Note that the keystore contains all of the keys for the entire multitenant database, in this case, keys for the CDB, PDB 1, and PDB 2.

In order to unplug a TDE-enabled PDB, the key(s) for that PDB must be exported from the keystore into a new file, known as an *exported keyfile*. Oracle will prevent the PDB from being unplugged unless the keys have first been exported. The exported keyfile is encrypted with a password (known as the *keyfile secret*) that is specified during the export. The diagram below illustrates the scenario where PDB 2 has been unplugged. Note that the key for PDB 2 still remains in the keystore. This illustrates an important point about Oracle keystores - once added, a key cannot be easily removed from a keystore.

You can plug back a PDB into a new CDB before importing the new keys. This results in the PDB being plugged in in restricted mode with plugin violations. Importing the keys is necessary to resolve the plugin violations and start up the PDB in unrestricted READ WRITE mode.

The design of TDE allows for the keys for a given CDB or PDB to be changed, via the `ADMINISTER KEY MANAGEMENT SET KEY` command. This process is known as *key rotation* and will update the master encryption key in the keystore while leaving the table keys in the data dictionary. The table keys themselves will be encrypted

with the new master encryption key, and any future updates to that data will use the new key. Existing data already written to the datafile or archive log will still be encrypted with the original key, however. For this reason, keys are never removed from an existing wallet, only new keys are added. In order to decrypt all of the data in a given database, all current and prior keys will be needed.

For more information on TDE and how it is configured and enabled, see the [Oracle documentation](#).

## Delphix implementation of TDE

Oracle recommends that the keystore be stored on a separate disk from the datafiles. In accordance with this recommendation, neither keystores nor exported keyfiles are stored on Delphix storage. Rather, they are placed on customer storage. Exported keyfiles generated by Delphix are stored in the *artifact directory* under the *keystores root directory*, while keystores generated by Delphix are stored in the location specified by sqlnet.ora for the target container database. It is the customer's responsibility to maintain these storage locations and ensure they are backed up as needed, just like database files. If the keystore or exported keyfile is lost, the data in the associated vPDB may not be recoverable and the vPDB will cease to operate.

Delphix support for TDE has the following requirements:

- The Oracle version must be 12cR2 or higher (Oracle 12cR1 is not supported).
- Parent keystores of the source PDB must not be on ASM storage. Target CDB keystores, however, can be on ASM storage.
- Migration of a TDE-enabled vPDB from one CDB to another requires [manual steps](#) that must be completed for migrate vPDB to be successful and to support refresh and rewind operations on the migrated vPDB.
- Only software keystores on the same host as the database files are supported, in particular, Oracle Key Vault is not supported.
- The dSource from which the initial provision is done must be encrypted when it is linked. Existing dSources can not be encrypted without unlinking and creating a new dSource.
- There is currently no supported transition path from existing TDE-enabled vPDBs using the TDE workaround to the full product solution. The TDE workaround continues to be supported for approved customers.
- For linked provisions, the target container database should have an autologin Keystore configured. For a cluster target, the autologin keystore is shared. For vCDB provisions, Delphix will create an autologin Keystore when configuring the vCDB Keystore.

Some or all of these restrictions may be relaxed in future versions of Delphix.

## Definitions

The following terms are used throughout TDE documentation and are summarized here for clarity. Note that the first occurrence of these terms may be on other documentation pages.

Term	Definition
Keystore/wallet	File found on the Oracle host which stores the keys used to encrypt and decrypt the internal table keys in a database. Every keystore has a password which is set when it is first created, and must be supplied for operations on it.
Parent keystore	Keystore with the keys used to encrypt the dSource PDB files.
Target keystore	Keystore for the target CDB into which the TDE-enabled vPDB is plugged.

Term	Definition
Artifact directory	Directory on the target system (not on Delphix storage) which stores keys needed to support Delphix workflows on TDE-enabled vPDBs. It is located under the keystores root directory.
Exported keyfile	File located on the target Oracle host which contains keys that have been exported from the keystore. It is encrypted with a secret that is specified when it is exported. The exported keyfile itself cannot be used as a keystore, but its contents can be imported into a new keystore.
Key rotation	Process for changing the master encryption key in the keystore via the <code>ADMINISTER KEY MANAGEMENT SET KEY</code> command. This does not remove the original key, rather it adds a new key to the wallet and future data will be encrypted with the new key.
Auxiliary container database (CDB)	Provisioning an Oracle vPDB requires running recovery to bring the snapshotted datafiles into a consistent state. This needs to be done in the context of a container database, which is created on the target system. After recovery is complete, the vPDB is unplugged and plugged into the target container, and the auxiliary container is deleted.
Keyfile secret	Password used to encrypt an exported keyfile.
Keystores root directory	User-specifiable location on the target system under which all TDE related artifacts such as keystores and exported keyfiles created by Delphix are stored. This includes both the artifact directories used for vPDBs and temporary directories used for auxiliary CDB keystores.

## Wallet location configuration

Oracle requires that the keystore location be specified to the database so that it can be accessed when reading from or writing to the database files. This location can be specified in 2 ways:

1. The `ENCRYPTION_WALLET_LOCATION` parameter in `sqlnet.ora`.
2. The `wallet_root` initialization parameter is available starting in Oracle 18, while `ENCRYPTION_WALLET_LOCATION` is available in Oracle 12.2. Oracle has indicated that support for `ENCRYPTION_WALLET_LOCATION` will end starting with Oracle 20.

Delphix supports both configurations for the appropriate releases (i.e. `ENCRYPTION_WALLET_LOCATION` only in 12.2, and both `ENCRYPTION_WALLET_LOCATION` and `wallet_root` in 18+). When using `ENCRYPTION_WALLET_LOCATION`, Delphix recommends referencing an environment variable, for example:

### Encryption wallet location

```
ENCRYPTION_WALLET_LOCATION=
(SOURCE=
```

```
(METHOD=FILE)
(METHOD_DATA=
(DIRECTORY=/u03/app/ora12201/admin/$ORACLE_UNQNAME/wallet/))
```

As there is only one `sqlnet.ora` file found under `$ORACLE_HOME`, it will be used for all databases that use that home. Specifying an environment variable such as `$ORACLE_UNQNAME` allows a different location for each database in the same `$ORACLE_HOME`. Any environment variable referenced in `sqlnet.ora` must always be set in the environment for the Oracle user. Delphix explicitly sets only `$ORACLE_HOME`, `$ORACLE_SID`, and `$ORACLE_UNQNAME` in the connections which are established by the Delphix engine, so it is recommended that only these variables be referenced in `sqlnet.ora`. For a 12.2 TDE vPDB provision, Delphix creates a unique `sqlnet.ora` file for the use of the auxiliary database during the provision. For provisions to vCDB targets, Delphix will set the `wallet_root` parameter to a user-provided path for versions 18c or higher and will use the path in `sqlnet.ora` for version 12.2.

### Required O/S permissions for the Delphix user

The provision itself is executed within the context of the environment user specified during the provision. This user does not have to be the Oracle user, and in fact, often is not. The Delphix user must be a member of the oracle group. During a TDE-enabled vPDB provision, the parent keystore is merged from a user-specified location to a location under the keystores root directory. The Delphix user does this copy via `ADMINISTER KEY MANAGEMENT` command. Since the Oracle user will do this, the Oracle user must be able to also create files in the wallet location.

The privilege requirements are satisfied by ensuring that the parent keystore has group read privileges, and the keystores root directory (owned by the Delphix user) has group write privileges.

## Oracle environment management

In order for the Delphix Engine to ingest data or provision virtual databases, your Oracle environments must comply with Delphix environment configuration standards.

## Quick start guide for Oracle on Linux

### Overview

This quick start guide, which is excerpted from the larger User Guide, is intended to provide you with a quick overview of working with Oracle database objects in the Delphix Engine. It does not cover advanced configuration options including Oracle RAC, Linking to Standby, or best practices for performance. It assumes that you are working in a Lab/Dev setting and attempting to quickly test Delphix Engine functionality. It assumes you will use the VMware Hypervisor.

In this guide, we will walk through deploying a Delphix Engine, configuring Oracle Source and Target environments on Linux servers, creating a dSource, and provisioning a VDB.

The following diagram describes the engine topology for Oracle environments. It illustrates the recommended ports to be open from the engine to remote services, to the engine, and to the Source and Target Environments.

For this Quick Start Guide, you can ignore the following components: Validated Sync Host, Replicated Engine, and Delphix Masking Engine.

Port allocation for Oracle environments

**Note:** \*Oracle listener typically runs on TCP port 1521. In cases where other ports are used, substitute for 1521 above. Starting with 6.0.7.0 release, this port is required only if database user credentials are provided. The port need not be open if no database user credentials are provided.

## Deploy OVA on VMware

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

1. Download the OVA file from <https://download.delphix.com>. You will need a support login from your sales team or a welcome letter.
  - a. Navigate to the Delphix Product Releases/ /appliance="" images="">
2. Login using the vSphere client to the vSphere server (or vCenter Server) where you want to install the Delphix Engine.
3. In the vSphere Client, click **File**.
4. Select **Deploy OVA Template**.
5. Browse to the OVA file.
6. Click **Next**.
7. Select a **hostname** for the Delphix Engine. This hostname will also be used in configuring the Delphix Engine network.
8. Select the **data center** where the Delphix Engine will be located.
9. Select the **cluster** and the **ESX host**.
10. Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
11. Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - Eager Zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
12. Select the **virtual network** you want to use. If using multiple physical NICs for link aggregation, you must use vSphere NIC teaming. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal Network Architecture for the Delphix Engine](#)
13. Click **Finish**. The installation will begin and the Delphix Engine will be created in the location you specified.
14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting Up Network Access to the Delphix Engine](#)

**i** If your source database is 4 TB, you probably need 4 TB of storage for the Delphix Engine. Add at least 4 data disks of similar size for the Delphix VM. For example: for a source database of 4 TB, create 4 VMDKs of 1 TB each.

**i** For a full list of requirements and best practice recommendations, see [Virtual Machine Requirements for VMware Platform](#)

## Setup network access to Delphix engine

1. Power on the Delphix Engine and open the Console.
2. Wait for the Delphix Management Service and Delphix Boot Service to come online. This might take up to 10 minutes during the first boot. Wait for the large orange box to turn green.
3. Press any key to access the sysadmin console.
4. Enter `sysadmin@SYSTEM` for the username and `sysadmin` for the password.
5. You will be presented with a description of available network settings and instructions for editing.

Delphix Engine Network Setup

To access the system setup through the browser, the system must first be configured **for** networking in your environment. From here, you can configure the primary **interface**, DNS, hostname, and **default** route. When DHCP is configured, all other properties are derived from DHCP settings.

To see the current settings, run "get." To change a property, run "set =." To commit your changes, run "commit." To exit **this** setup and **return** to the standard CLI, run "discard."

```

defaultRoute    IP address of the gateway for the default route -- for
example, "1.2.3.4."

dhcp            Boolean value indicating whether DHCP should be used for
the primary interface. Setting this value
to "true" will cause all other properties (address,
hostname, and DNS) to be derived from the DHCP
response

dnsDomain       DNS Domain -- for example, "delphix.com"

dnsServers      DNS server(s) as a list of IP addresses -- for example,
"1.2.3.4,5.6.7.8."

hostname        Canonical system hostname, used in alert and other logs --
for example, "myserver"

primaryAddress  Static address for the primary interface in CIDR notation
-- for example, "1.2.3.4/22"

```

Current settings:

```

defaultRoute: 192.168.1.1
dhcp: false
dnsDomain: example.com
dnsServers: 192.168.1.1
hostname: Delphix
primaryAddress: 192.168.1.100/24

```

- Configure the `hostname` . If you are using DHCP, you can skip this step.

```
delphix network setup update *> set hostname=<hostname>
```

warning: Use the same `hostname` you entered during the server installation.

- Configure DNS. If you are using DHCP, you can skip this step.

```

delphix network setup update *> set dnsDomain=<domain>
delphix network setup update *> set dnsServers=<server1-ip>[,<server2-ip>,...]

```

- Configure either a static or DHCP address.  
DHCP Configuration

```
delphix network setup update *> set dhcp=true
```

#### Static Configuration

```
delphix network setup update *> set dhcp=false
delphix network setup update *> set primaryAddress=<address>/<prefix-len>
```

warning: The static IP address must be specified in CIDR notation (for example, `192.168.1.2/24` )

9. Configure a default gateway. If you are using DHCP, you can skip this step.

```
delphix network setup update *> set defaultRoute=<gateway-ip>
```

10. Commit your changes. Note that you can use the `get` command prior to committing to verify your desired configuration.

```
delphix network setup update *> commit
Successfully committed network settings. Further setup can be done through the
browser at:
```

```
    http://<address>
```

Type "exit" to disconnect, or any other commands to **continue** using the CLI.

11. Check that you can now access the Delphix Engine through a Web browser by navigating to the displayed IP address, or hostname if using DNS.
12. Exit setup.

```
delphix> exit
```

## Setting up the Delphix engine

Once you setup the network access for Delphix Engine, navigate to the Delphix Engine URL in your browser for server setup.

The welcome screen below will appear for you to begin your Delphix Engine setup.

**DELPHIX SETUP** Setup Help

### Virtualization Setup

- Welcome
- Administrators
- Time
- Network
- Network Security
- Storage
- Outbound Connectivity
- Authentication
- **Network Authorization**
- Registration
- Summary

#### Network Authorization

KERBEROS CONFIGURATION

Use Kerberos authentication to communicate with remote hosts

Kerberos Key Distribution Center host(s)

Hostname	Port
No Rows To Show	

Realm:

Principal:

Keytab:

The setup procedure uses a wizard process to take you through a set of configuration screens:

- Administrators
- Time
- Network
- Network Security
- Storage
- Outbound Connectivity
- Authentication
- Network Authorization
- Registration
- Summary

1. Connect to the Delphix Engine at <http://login/index.html#serverSetup>.

The **Delphix Setup** application will launch when you connect to the server. Enter your **sysadmin** login credentials, which initially defaults to the username **sysadmin**, with the initial default password of **sysadmin**. On first login, you will be prompted to change the initial default password.

2. Click **Next**.

#### Administrators

The Delphix Engine supports two types of administrators:

- System administrator (**sysadmin**) - this is the engine system administrator. The sysadmin password is defined here.
- Engine administrator (**admin**) - this is typically a DBA who will administer all the data managed by the engine.

On the Administrators tab, you set up the sysadmin password by entering an email address and password. The details for the admin are displayed for reference.

**⚠** The default domain user created on Delphix Engines from 5.3.1 is known as **admin** instead of `delphix_admin`. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling `delphix_admin`.

## Time

The engine time is used as the baseline for setting policies that coordinate between virtual databases and external applications

Choose your option to setup system time in this section. For a Quick Start, simply set the time and your timezone. You can change this later.

## Network

The initial out-of-the-box network configuration in the OVA file is set to use a single VMXNET3 network adapter.

You have already configured this in the initial configuration. Delphix supports more advanced configurations, but you can enable those later.

## Storage

You should see the data storage VMDKs or RDMs you created during the OVA installation. Click **Next** to configure these for data storage.

## Serviceability

Choose your options to configure serviceability settings.

For a Quick Start, accept the defaults. You can change this later.

## Authentication service

Choose your options to configure authentication services.

For a Quick Start, accept the defaults. You can change this later.

## Registration

If the Delphix Engine has access to the external Internet (either directly or through a web proxy), then you can auto-register the Delphix Engine:

1. Enter your **Support username** and **Support password**.
2. Click **Register**.

If external connectivity is not immediately available, you must perform manual registration.

1. Copy the **Delphix engine registration code** in one of two ways:
  - a. Manually highlight the registration code and copy it to clipboard. Or,
  - b. Click **Copy registration code to clipboard**.
2. Transfer the Delphix Engine's registration code to a workstation with access to the external network Internet. For example, you could e-mail the registration code to an externally accessible e-mail account.
3. On a machine with access to the external Internet, please use your browser to navigate to the Delphix Registration Portal at <http://register.delphix.com>
4. Login with your Delphix support credentials (username and password).
5. Paste the **Registration code**.
6. Click **Register**.

**⚠** Although your Delphix Engine will work without registration, we strongly recommend that you register each engine as part of the setup. Failing to register the Delphix Engine will impact its supportability and security in future versions.

To regenerate the registration code for a Delphix Engine please refer to, [Regenerating the Delphix Engine Registration Code](#). Delphix strongly recommends that you regenerate this code and re-register the engine regularly to maximize the Support Security of the Delphix Engine. Delphix recommends doing this every six months.

### Summary

The final summary tab will enable you to review your configurations for System Time, Network, Storage, Serviceability, and Authentication.

1. Click the **Back** button to go back and to change the configuration for any of these server settings.
2. If you are ready to proceed, then click **Submit**.
3. Click **Yes** to confirm that you want to save the configuration.
4. Click **Setup** to acknowledge the successful configuration.
5. There will be a wait of several minutes as the Delphix Engine completes the configuration.

### Requirements for Oracle hosts and databases

In order to begin using Oracle environments with Delphix, you will need to configure the source and target hosts with the requirements described on this page.

#### Oracle hosts and databases

On each host with Oracle, there must be an operating system user configured to the required specifications for Delphix, as explained in the table below. This user (i.e. delphix\_os) can easily be created by using the createDelphixOSUser.sh script (located at the bottom of the page).

These requirements apply to both source and target environments. However, target environments have additional requirements which are detailed in the 'Target Host Requirements' section below.

#### Source host requirement

Host requirement	Explanation
Profile and privileges should be the same as the Oracle user (e.g. oracle) on the host.	For example, delphix_os should have the same environment variable settings (\$PATH, \$ORACLE_HOME, etc.), umask, and ulimit settings, as the user oracle.

Host requirement	Explanation
<p>The Delphix software owner account (e.g. delphix_os) must have the same primary OS group as the Oracle software owner account (e.g. oracle).</p>	<p>Delphix recommends giving the delphix_os user the same primary OS group as the Oracle home owner. This ensures the Delphix engine can fully and automatically discover Oracle homes, databases, and listeners.</p> <p>Often, this is an OS group named oinstall. However, the oinstall group is not always necessary depending on your Oracle configuration. This user requires access to the libobk_proxy.so library in the toolkit for the child processes triggered by RMAN.</p>
<p>The delphix_os user must have the Oracle OSDBA group (typically dba) as a primary or secondary OS group.</p>	<p>The OSDBA group allows "OS authentication" when connecting to an Oracle database instance by specifying either username or password (i.e. rman target /), thus eliminating the need to store or retrieve a SYSDBA password.</p> <p><b>Oracle 12c</b> For Oracle 12c and later versions of Oracle, the delphix_os user can also use OSBACKUPDBA as its secondary group. This is typically the BACKUPDBA group on the host.</p>
<p>For secondary group requirements, the Delphix OS user must be a member of the SYSBACKUP OS group (12.1 or higher) or the SYSDBA OS group (11.2 and lower).</p>	<p>This ensures that the Delphix engine is able to take snapshots of source databases using RMAN.</p>
<p>There must be a directory on the source host where the Delphix Engine Toolkit can be installed, for example: /var/opt/delphix/toolkit</p>	<p>The delphix_os user and primary OS group (i.e. oinstall) must own the directory.</p> <p>The directory must have at least permissions -rwxrwx--- (0770)</p> <p>The delphix_os user must have read and execute permissions on each directory in the path leading to the toolkit directory.</p> <p>At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.</p>
<p>The Delphix Engine must be able to make an SSH connection to the source host (typically port 22).</p>	

Host requirement	Explanation
Read access to \$ORACLE_HOME and all underlying files and directories.	Delphix needs to run locally available Oracle tools such as sqlplus and RMAN. Those executables, as well as various required libraries, reside inside the Oracle home

### Additional requirements for RAC environments

If the source host is part of a RAC cluster, Delphix will attempt to use all nodes and crsctl for its operations.

RAC environment requirement	Explanation
The delphix_os user and Delphix Toolkit configuration must be the same on each node in the RAC cluster	<ul style="list-style-type: none"> <li>delphix_os must have execute permission on crsctl and srvctl on each node in the cluster.</li> <li>access to olsnodes is needed.</li> <li>The Delphix Toolkit must be installed in the same directory path on each of the nodes in the source cluster.</li> <li>All data files, archive logs, and database control file must be located on storage shared by all of the cluster nodes.</li> <li>Each node in the cluster must be able to access archive logs and the database control file from all other nodes.</li> <li>At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.</li> </ul>

 **Masked Provisioning is not supported on Oracle RAC.**

### Auto-discovery requirements

The preferred way to find source databases is to allow Delphix to automatically discover your Oracle Homes and Databases by examining the inventory and oratab files and the listener setup. Successful autodiscovery requires read access to these and related files.

In **most** environments, delphix\_os group membership is sufficient to perform auto-discovery.

However, if you have overridden Oracle's group permission structure, you may need to modify privileges to allow auto-discovery.

Auto-discovery requirements	Explanation
<p>The ORATAB file must exist (typically in /etc/oratab or /var/opt/oracle/oratab) and be readable by delphix_os.</p> <p>Read access to:</p> <ul style="list-style-type: none"> <li>• /etc/orainst.loc or /var/opt/oracle/orainst.loc.</li> <li>• the Oracle inventory file (inventory.xml)</li> </ul>	<p>The ORATAB is used to determine the location of the Oracle installations on your host.</p> <p>Note: The Oracle inventory file is identified by the contents of orainst.loc (for example, \$INVENTORY_HOME/ContentsXML/inventory.xml).</p>
<p>Permission to run pargs on Solaris hosts and ps on AIX, HP-UX, and Linux hosts, as super-user.</p> <p>This permission is usually granted via sudo authorization of the commands.</p>	<p>Unless you have used a custom TNS_ADMIN setting, elevated access to ps (pargs on Solaris) is not required</p> <p>See the topic <a href="#">Sudo Privilege Requirements for Oracle Environments</a> for further explanation of this requirement, and <a href="#">Sudo File Configuration Examples for Oracle Environments</a> for examples of file configurations</p>

### Source database requirements

For each source database, there are specific configurations required for Delphix to ingest data.

Source database requirement	Explanation
<p>For each Oracle Home, the delphix_os user should have execute permission for the programs in \$ORACLE_HOME/bin.</p>	<p>If symlinks are configured, Delphix must be configured with the same \$ORACLE_HOME path as was used when starting the instance.</p> <p>Ensure the PermitUserEnvironment configuration parameter = "yes" in the sshd_config file</p> <p>The \$ORACLE_HOME/bin/oracle executable must have the SETUID and SETGID flags set. Permissions on the oracle binary must be at least -rwsr-s-x (06751).</p>
<p>Source databases must be in ARCHIVELOG mode to ensure that redo logs are archived.</p>	<p>Archive logs are required to make SnapSyncs consistent and provisionable.</p>
<p>Enable Block Change Tracking (BCT). (Highly Recommended).</p>	<p>Enabling BCT will improve SnapSync operation time. Without BCT, incremental SnapSyncs must scan the entire database.</p>

Source database requirement	Explanation
Enable FORCE LOGGING. (Highly Recommended)	<p>If you do not enable FORCE LOGGING and NOLOGGING operations take place, you will get a Fault from the Delphix Engine.</p> <p>If you must use NOLOGGING to meet specific performance criteria, take a new snapshot of the source database after doing the NOLOGGING operations to bring the dSource up-to-date before provisioning VDBs.</p>

## Operating system specific requirements

### Solaris

On a Solaris host, `gtar` must be installed. Delphix uses `gtar` to handle long file names when extracting the toolkit files into the toolkit directory on a Solaris host. The `gtar` binary should be installed in one of the following directories:

- `/bin/usr`
- `/bin/sbin/usr`
- `/sbin/usr/contrib`
- `/bin/usr/sfw`
- `/bin/opt/sfw`
- `/bin/opt/csw/bin`

## Additional target /staging host requirements

This topic describes the user privileges and environment requirements that are required for Oracle target hosts and databases collectively referred to as target environments.

These are in addition to the ‘Oracle Hosts and Database Requirements’ called out above.

Target/Staging host requirement	Explanation
The Delphix OS user must be a member of the SYSDBA OS group.	This ensures that the Delphix engine is able to create new VDBs on target hosts.
There must be a directory (e.g. <code>"/mnt/provision/"</code> or <code>"/mnt/staging/"</code> ) that will be used as a container for the NFS mount points that are created when provisioning a VDB.	<p>The <code>delphix_os</code> user and primary OS group (i.e. <code>oinstall</code> or <code>dba</code>) must own the directory.</p> <p>The directory must have at least permissions <code>-rwxrwx---</code> (0770).</p> <p>There must be no symbolic links in the path of this directory, because NFS can mount into a directory with symlinks in its path, but cannot unmount.</p>

Target/Staging host requirement	Explanation
Permission to run: <ul style="list-style-type: none"> <li>• mount, umount, mkdir, rmdir as super-user.</li> <li>• pargs on Solaris hosts</li> <li>• ps on Linux, AIX, and HP-UX as super-user.</li> <li>• nfso on AIX hosts as super-user</li> </ul>	The following permissions are usually granted via sudo authorization of the commands. See <a href="#">Sudo Privilege Requirements for Oracle Environments</a> for further explanation of the commands, and <a href="#">Sudo File Configuration Examples for Oracle Environments</a> for examples of the /etc/sudoers file on different operating systems.
(Optional) Write permission to the \$ORACLE_BASE_CONFIG/dbs directory.	(i.e. chmod g+w \$ORACLE_BASE_CONFIG/dbs)
An Oracle listener process running on the target host for provisioning a VDB	The listener's version should be equal to or greater than the highest Oracle version that will be used to provision a VDB.
Required packages on target hosts: <ol style="list-style-type: none"> <li>1. portmapper / rpcbind</li> <li>2. status daemon (rpc.statd)</li> <li>3. NFS lock manager (rpc.lockd/lockmgr)</li> </ol>	As the Delphix Engine uses NFSv3 for mounting target host filesystems, the prerequisite packages to support NFSv3 client communication are required for normal operation, and the required services to support NFS client communications (including file locking) must be running. NFSv3 is enabled by default and to enable NFSv4, see NFSv4 Configuration.
If using ASM, the delphix_os user must have the Oracle ASM ownership groups as secondary OS groups (typically asmadmin and asmdba)	This ensures the Delphix engine can fully and automatically discover Oracle homes, databases, and listeners.

#### Deploy Hostchecker to Validate Delphix Requirements

Delphix has developed a hostchecker script that contains standardized checks for source and target hosts - these checks generally fall into three buckets

- OS and Host permissions/access
- Network Port Checks
- DB-specific functionality

OS and Host permissions/access and network port checks can (and should) be performed prior to Delphix installation to ensure a smooth deployment.

Each DB should have a specifically associated hostchecker - you can find detailed documentation on the DB-specific hostchecker page.

1. Download the appropriate **HostChecker tarball** for your engine from <https://download.delphix.com/> Tarballs follow the naming convention "hostchecker\_<OS>\_<processor>.tar". For example, if you are validating a linux x86 host you should download the hostchecker\_linux\_x86.tar tarball.
2. Create a working directory and extract the **HostChecker files** from the **HostChecker tarball**.

```
mkdir dlpX-host-checker
cd dlpX-host-checker/
```

```
tar -xf hostchecker_linux_x86.tar
```

3. Run the `sh` script contained within:

```
sh hostchecker.sh
```

This will extract the JDK included in the tarball (if necessary) and invoke the HostChecker.

```
ora10205@bbdhcp:/home/ora10205/hostchecker-> sh hostchecker.sh
Extracting the JDK from the tarball jdk-6u45-linux-i586.tar.gz.
```

**warning: Don't Run as Root** Do not run the HostChecker as root; this will cause misleading or incorrect results from many of the checks.

4. Select which **checks** you want to run.

**Info: Run Tests without the Interface**

You can also run checks without spawning the interface. Enter `--help` to get a list of arguments you can pass to the HostChecker.

5. As the checks are made, enter the requested **arguments**.
6. Read the output of the check. The general format is that severity increases as you scroll down the output. First comes informational output, then warnings, then errors. **warning**: Internal Errors If you see a message that starts with `Internal Error`, forward it to Delphix Support immediately. This represents a potential bug in the HostChecker, and not necessarily a problem with your environment.
7. Error or warning messages will explain any possible problems and how to address them. Resolve the issues that the HostChecker describes. Do not be surprised or undo your work if more errors appear the next time you run HostChecker, because the error you just fixed may have been masking other problems.
8. Repeat steps 3 - 7 until all the checks return no errors or warnings.

## Adding Oracle source and target environments

Follow the steps below to add **both** source and target environments for Oracle.

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Plus** icon next to **Environments**.
5. In the **Add environment** dialog, select **Unix/Linux**.
6. Select **Standalone host** or **Oracle cluster**, depending on the type of environment you are adding.
7. For standalone Oracle environments enter the **Host IP** address.
8. For Oracle RAC environments, enter the **Node address** and **Cluster home**.
9. Enter an optional **Name** for the environment.
10. Enter the **SSH** port. The default value is **22**.
11. Enter a **Username** for the environment. See [Requirements for Oracle Target Hosts and Databases](#) for more information on the required privileges for the environment user.
12. Select a Login Type: — Username and Password - enter the OS username and password, or — Username and Public Key - enter the OS username. — Password Vault - select from an existing Enterprise Password Vault

**Info** Using Public Key Authentication

If you want to use public-key encryption for logging into your Unix-based environment:

- a. Select **Public key** for the **Login type**.
- b. Click **View public key**.

- c. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you will need to create it.
  - i. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by the user).
  - ii. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
  - iii. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.

The public key needs to be added only once per user and per environment.

13. For **Password login**, click **Verify credentials** to test the username and password.
14. Enter a **Toolkit path**. The toolkit directory stores scripts used for Delphix Engine operations, and should have a persistent working directory rather than a temporary one. The toolkit directory will have a separate subdirectory for each database instance. The toolkit path must have 0770 permissions and at least 345MB of free space.
15. Click **Submit**.

## Linking an Oracle data source

1. Login to the **Delphix management** application.
2. Navigate to **Manage > Datasets**.
3. Click the plus icon and select **Add dSource**.
4. In the **Add dSource** wizard, select the source database with the correct environment user-specified.  
Info: For linking an Oracle staging push dSource, follow the procedure in [Staging Push Implementation for Oracle](#)
5. Enter your login credentials for the source database and click **Verify credentials**. If you are linking a mounted standby, Click **Next**. See the topics under [Linking Oracle Physical Standby Databases](#) for more information about how the Delphix Engine uses non-SYS login credentials.
6. Enter a name and select a group for your dSource. Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups](#) for more information.
7. Select the **Data Management** settings needed. For more information, visit [Data Management Settings for Oracle Data Sources](#)
8. Assign existing policies to the new dSource. New policies can be created and associated later.
9. Enter any scripts that should be run using the **Hooks** page.
10. Review the dSource Configuration and Data Management information, and then click **Submit**.

Once the action to add a dSource has been submitted, the Delphix Engine will initiate a DB\_Link job to create the dSource. If the *Load Immediately* option was selected in the data management page a DB\_Sync job will also be executed to ingest data from the source, otherwise, this first DB\_Sync job will run as per the associated SnapSync policy.

When the jobs have successfully completed, the database icon will change to a dSource icon on the Environments > Databases screen, and the dSource will be added to the list of Datasets under its assigned group.

## Provisioning an Oracle VDB

1. Login to the **Delphix management** application.
2. Select **Manage > Datasets**.
3. In the **Datasets** panel on the left-hand side, click the **group** containing the dSource or VDB from which you want to provision.
4. Click the **TimeFlow** tab.
5. Select a **snapshot**.  
You can take a snapshot of the dSource from which to provision. To do so, click the **Camera** icon.

6. **Optional:** Select  to open LogSync timeline.

7. Select  to provision from a point of time within a snapshot. You can select by date or time.
8. Click  and the **Provision VDB**wizard will open:
- For **Oracle single instance** the fields **Installation home, Database unique name, SID, Database name, Mount base,** and **Environment user** will auto-populate with information from the parent.
  - For **Oracle RAC** the fields **Installation home, Database unique name, SID, Database name, Mount base, Instance number, Instance name** and **Environment user** will auto-populate with information from the parent.
- Editable Fields in the VDB Provision Wizard  
 The following fields are editable:  
 Installation Home (need to have an additional compatible target)  
 Database Unique Name  
 SID  
 Database Name  
 Mount Base  
 Instance Number (RAC Only)  
 Instance Name (RAC Only)
- If you need to add a new target environment for the VDB, click the green **Plus** icon next to the **Filter target** field, and follow the instructions in [Oracle Single Instance or RAC Environment](#)
  - Review the information for **Installation home, Database unique name, SID,** and **Database name.** Edit as necessary.
  - Review the **Mount base** and **Environment user.** Edit as necessary. The Environment User must have permission to write to the specified Mount Base, as described in [Requirements for Oracle Target Hosts and](#)

[Databases](#). You may also want to create a new writeable directory in the target environment with the correct permissions and use that as the Mount Base for the VDB.

12. Select **Provide privileged credentials** if you want to use login credentials on the target environment that are different from those associated with the **Environment user**.
13. Click **Advanced** to customize the VDB online log size and log groups, archivelog mode, local\_listener parameter (TCP/IP protocol addresses), additional VDB configuration settings or file mappings, or custom environment variables. For more information, see [Customizing Oracle VDB Configuration Settings](#), [Customizing VDB File Mappings](#), and [Customizing Oracle VDB Environment Variables](#). If you are provisioning to a target environment that is running a Linux OS, you will need to compare the `SGA_TARGET` configuration parameter with the shared memory size in `/dev/shm`. The shared memory configured on the target host should match the SGA memory target. You can check the Linux OS shared memory size with the command `df -k /dev/shm` and the `SGA_TARGET` configuration parameter by opening the **Advanced** settings and then finding the value for `SGA_TARGET` under **VDB Configuration templates**.
14. Click **Next**.
15. Select a **Target Group** for the VDB.
16. Enable Auto VDB Restart to allow the VDB to be automatically restarted when the target host reboot is detected by Delphix.
17. Click **Next**.
18. Select a **Snapshot policy** for the VDB.
19. Click **Next**.
20. Enter any operations that should be run at Hooks during the provisioning process. Click **Next**.
21. Click **Submit**.

When provisioning starts, you can review the progress of the job by selecting the VDB and clicking on the **Status** tab, or by selecting **Manage/Dashboards** and viewing the **Job history** panel. Alternatively, you could see this in the **Actions sidebar**. When provisioning is complete, the VDB will be included in the group you designated and listed in the **Datasets** panel. If you select the VDB in the **Datasets** panel and click the **Configuration** tab, you can view information about the database and its Data Management settings.

## Next steps

Congratulations! You have provisioned your first virtual database!

Now, perform some simple functional tests with your application. You can connect your app to the VDB using standard TNS/JDBC techniques. Delphix has already registered the VDB for you on the target listener.

We suggest the following next steps:

1. Drop a table and use the VDB Rewind feature to test the recovery of your VDB.
2. Take a snapshot of your dSource and refresh your VDB to quickly get fresh production data.
3. Provision a new VDB from your VDB to test the sharing data quickly with other teams.
4. Mask your new VDB to protect sensitive data. Provision new VDBs from that masked VDB to quickly provide safe data to development and QA teams.

## Script

- [createDelphixOSUser.sh](#)

## Quick start guide for Oracle on Solaris SPARC

This quick start guide, which is excerpted from the larger User Guide, is intended to provide you with a quick overview of working with Oracle database objects in the Delphix Engine. It does not cover advanced configuration options including Oracle RAC, Linking to Standby, or Best Practices for Performance. It assumes that you are working in a Lab/Dev setting and attempting to quickly test Delphix functionality. It assumes you will use the VMware Hypervisor.

### Overview

In this guide, we will walk through deploying a Delphix Engine, configuring Oracle Source and Target environments on Solaris SPARC servers, creating a dSource, and provisioning a VDB.

The following diagram describes the Delphix topology for Oracle environments. It illustrates the recommended ports to be open from Delphix to remote services, to the Delphix Engine, and to the Source and Target Environments.

For this Quick Start Guide, you can ignore the following components: Validated Sync Host, Replicated Engine, and Delphix Masking Engine.

Port allocation for Oracle environments

**Note:** \*Oracle listener typically runs on TCP port 1521. In cases where other ports are used, substitute for 1521 above. Starting with 6.0.7.0 release, this port is required only if database user credentials are provided. The port need not be open if no database user credentials are provided.

## Deploy OVA on VMware

Use the Delphix-supplied OVA file to install the Delphix Engine. The OVA file is configured with many of the minimum system requirements. The underlying storage for the install is assumed to be redundant SAN storage.

1. Download the OVA file from <https://download.delphix.com>. You will need a support login from your sales team or a welcome letter.
  - a. Navigate to the Delphix Product Releases/<Current Version>/Appliance Images page.
2. Login using the vSphere client to the vSphere server (or vCenter Server) where you want to install the Delphix Engine.
3. In the vSphere Client, click **File**.
4. Select **Deploy OVA template**.
5. Browse to the OVA file.
6. Click **Next**.
7. Select a **hostname** for the Delphix Engine. This hostname will also be used in configuring the Delphix Engine network.
8. Select the **data center** where the Delphix Engine will be located.
9. Select the **cluster** and the **ESX host**.
10. Select one (1) **data store** for the **Delphix OS**. This datastore can be **thin-provisioned** and must have enough free space to accommodate the 127GB comprising the Delphix operating system.
11. Select four (4) or more **data stores** for Database Storage for the Delphix Engine. The Delphix Engine will stripe all of the Database Storage across these VMDKs, so for optimal I/O performance, each VMDK must be equal in size and be configured **Thick Provisioned - eager zeroed**. Additionally, these VMDKs should be distributed as evenly as possible across all four SCSI I/O controllers.
12. Select the **virtual network** you want to use. If using multiple physical NICs for link aggregation, you must use vSphere NIC teaming. Do not add multiple virtual NICs to the Delphix Engine itself. The Delphix Engine should use a single virtual network. For more information, see [Optimal Network Architecture for the Delphix Engine](#)
13. Click **Finish**. The installation will begin and the Delphix Engine will be created in the location you specified.
14. Once the installation has completed, power on the Delphix Engine and proceed with the initial system configuration as described in [Setting Up Network Access to the Delphix Engine](#)

**i** If your source database is 4 TB, you probably need 4 TB of storage for the Delphix Engine. Add at least 4 similarly sized data disks for Delphix VM e.g. for 4 TB create 4 VMDKs of 1 TB each.

**i** For a full list of requirements and best practice recommendations, see [Virtual Machine Requirements for VMware Platform](#)

## Setup network access to Delphix engine

1. Power on the Delphix Engine and open the Console.
2. Wait for the Delphix Management Service and Delphix Boot Service to come online. This might take up to 10 minutes during the first boot. Wait for the large orange box to turn green.
3. Press any key to access the sysadmin console.
4. Enter `sysadmin@SYSTEM` for the username and `sysadmin` for the password.
5. You will be presented with a description of available network settings and instructions for editing.

### Delphix Engine Network Setup

To access the system setup through the browser, the system must first be configured **for** networking in your

environment. From here, you can configure the primary **interface**, DNS, hostname, and **default** route. When DHCP is configured, all other properties are derived from DHCP settings.

To see the current settings, run `"get."` To change a property, run `"set <property>=<value>."` To commit your changes, run `"commit."` To exit **this** setup and **return** to the standard CLI, run `"discard."`

```

    defaultRoute    IP address of the gateway for the default route -- for
example, "1.2.3.4."

    dhcp            Boolean value indicating whether DHCP should be used for
the primary interface. Setting this value
                    to "true" will cause all other properties (address,
hostname, and DNS) to be derived from the DHCP
                    response
    dnsDomain       DNS Domain -- for example, "delphix.com"
    dnsServers      DNS server(s) as a list of IP addresses -- for example,
"1.2.3.4,5.6.7.8."
    hostname        Canonical system hostname, used in alert and other logs --
for example, "myserver"
    primaryAddress  Static address for the primary interface in CIDR notation
-- for example, "1.2.3.4/22"
Current settings:
defaultRoute: 192.168.1.1
dhcp: false
dnsDomain: example.com
dnsServers: 192.168.1.1
hostname: Delphix
primaryAddress: 192.168.1.100/24

```

- Configure the `hostname` . If you are using DHCP, you can skip this step.

```
delphix network setup update *> set hostname=<hostname>
```

**Note:** Use the same `hostname` you entered during the server installation

- Configure DNS. If you are using DHCP, you can skip this step.

```
delphix network setup update *> set dnsDomain=<domain>
delphix network setup update *> set dnsServers=<server1-ip>[,<server2-ip>,...]
```

- Configure either a static or DHCP address.  
DHCP Configuration

```
delphix network setup update *> set dhcp=true
```

Static Configuration

```
delphix network setup update *> set dhcp=false
```

```
delphix network setup update *> set primaryAddress=<address>/<prefix-len>
```

The static IP address must be specified in CIDR notation (for example, 192.168.1.2/24 )

- Configure a default gateway. If you are using DHCP, you can skip this step.

```
delphix network setup update *> set defaultRoute=<gateway-ip>
```

- Commit your changes. Note that you can use the `get` command prior to committing to verify your desired configuration.

```
delphix network setup update *> commit
Successfully committed network settings. Further setup can be done through the
browser at:
    http://<address>
Type "exit" to disconnect, or any other commands to continue using the CLI.
```

- Check that you can now access the Delphix Engine through a Web browser by navigating to the displayed IP address, or hostname if using DNS.
- Exit setup.

```
delphix> exit
```

## Setting up the Delphix engine

Once you setup the network access for Delphix Engine, enter Delphix Engine URL in your browser for server setup.

The welcome screen below will appear for you to begin your Delphix Engine setup.

### Virtualization Setup

**Welcome**

Choose engine type to setup:

- Virtualization
- Masking

This wizard will step you through the setup. During this process you will complete the following:

- Create your password for the default "sysadmin" user
- Set the system time
- Configure network and services
- Configure the storage pool
- Configure proxies, SMTP, and LDAP (these are optional)
- Register your software

After setup is complete, you will have two administrators defined:

- The system administrator, "**sysadmin**" with the password you defined. This will be the system administrator for the instance.
- The engine administrator, "**admin**" with the password you defined. This is typically a DBA who will administer all the data managed by the instance.

When setup is complete, log in as engine administrator to begin using your engine.

The setup procedure uses a wizard process to take you through a set of configuration screens:

- Administrators
- Time
- Network
- Network Security
- Storage
- Outbound Connectivity
- Authentication
- Network Authorization
- Registration
- Summary

1. Connect to the Delphix Engine at <http://login/index.html#serverSetup> . The **Delphix setup** application will launch when you connect to the server. Enter your **sysadmin** login credentials, which initially defaults to the username **sysadmin**, with the initial default password of **sysadmin**. On first login, you will be prompted to change the initial default password.
2. Click **Next**.

## Administrators

The Delphix Engine supports two types of administrators:

- System Administrator (**sysadmin**) - this is the engine system administrator. The sysadmin password is defined here.
- Engine Administrator (**admin**) - this is typically a DBA who will administer all the data managed by the engine.

On the Administrators tab, you set up the sysadmin password by entering an email address and password. The details for the delphix\_admin are displayed for reference.

 The default domain user created on Delphix Engines is now **admin** instead of delphix\_admin. When engines created before 5.3.1 are upgraded to 5.3.1 or later they will retain their old username 'delphix\_admin'. To avoid complications Delphix recommends creating users with an admin role and then Disabling delphix\_admin.

## System time

Choose your option to setup system time in this section.

For a Quick Start, simply set the time and your timezone. You can change this later.

## Network

The initial out-of-the-box network configuration in the OVA file is set to use a single VMXNET3 network adapter.

You've already configured this in the initial configuration. Delphix supports more advanced configurations, but you can enable those later.

## Storage

You should see the data storage VMDKs or RDMs you created during the OVA installation. Click Next to configure these for data storage.

## Outbound connectivity

Choose your options to configure outbound connectivity settings.

For a Quick Start, take the defaults. You can change this later.

## Authentication

Choose your options to configure authentication services.

For a Quick Start, take the defaults. You can change this later.

## Registration

If the Delphix Engine has access to the external Internet (either directly or through a web proxy), then you can auto-register the Delphix Engine:

1. Enter your **Support username** and **Support password**.
2. Click **Register**.

If external connectivity is not immediately available, you must perform manual registration.

1. Copy the **Delphix engine registration code** in one of two ways:
  - a. Manually highlight the registration code and copy it to clipboard. Or,
  - b. Click **Copy registration Code to Clipboard**.
2. Transfer the Delphix Engine's registration code to a workstation with access to the external network Internet. For example, you could e-mail the registration code to an externally accessible e-mail account.
3. On a machine with access to the external Internet, please use your browser to navigate to the Delphix Registration Portal at <http://register.delphix.com>
4. Login with your Delphix support credentials (username and password).
5. Paste the **Registration code**.
6. Click **Register**.

 While your Delphix Engine will work without registration, we strongly recommend that you register each Delphix Engine as part of the setup. Failing to register the Delphix Engine will impact its supportability and security in future versions.

To regenerate the registration code for a Delphix Engine please refer to, [Regenerating the Delphix Engine Registration Code](#). Delphix strongly recommends that you regenerate this code and re-register the engine regularly to maximize the Support Security of the Delphix Engine. Delphix recommends doing this every six months.

## Summary

The setup procedure uses a wizard process to take you through a set of configuration screens:

- Administrators
- Time
- Network
- Network Security
- Storage
- Outbound Connectivity
- Authentication
- Network Authorization
- Registration
- Summary

1. Connect to the Delphix Engine at <http://login/index.html#serverSetup>. The **Delphix Setup** application will launch when you connect to the server. Enter your **sysadmin** login credentials, which initially defaults to the username **sysadmin**, with the initial default password of **sysadmin**. On first login, you will be prompted to change the initial default password.
2. Click **Next**.

## [Requirements for Oracle hosts and databases](#)

### Oracle hosts and databases

To begin using Oracle environments in Delphix, reference this article as a provided outline of the configuration requirements for the source and target hosts.

On each host with Oracle, there must be an operating system user configured to the required specifications for Delphix, as explained in the table below. This user (i.e. `delphix_os`) can easily be created by using the `createDelphixOSUser.sh` script (located at the bottom of the page).

These requirements apply to both source and target environments. However, target environments have additional requirements which are detailed in the ‘Target Host Requirements’ section below.

### Source host requirement

Host requirement	Explanation
Profile and privileges should be the same as the Oracle user (e.g. <code>oracle</code> ) on the host.	For example, <code>delphix_os</code> should have the same environment variable settings ( <code>\$PATH</code> , <code>\$ORACLE_HOME</code> , etc.), <code>umask</code> , and <code>ulimit</code> settings, as the user <code>oracle</code> .
The Delphix software owner account (e.g. <code>delphix_os</code> ) must have the same primary OS group as the Oracle software owner account (e.g. <code>oracle</code> ).	<p>Delphix recommends giving the <code>delphix_os</code> user the same primary OS group as the Oracle home owner. This ensures the Delphix engine can fully and automatically discover Oracle homes, databases, and listeners.</p> <p>Often, this is an OS group named <code>oinstall</code>. However, the <code>oinstall</code> group is not always necessary depending on your Oracle configuration. This user requires access to the <a href="#">libobk_proxy.so</a> library in the toolkit for the child processes triggered by <code>RMAN</code>.</p>

Host requirement	Explanation
The delphix_os user must have the Oracle OSDBA group (typically dba) as a primary or secondary OS group.	<p>The OSDBA group allows "OS authentication" when connecting to an Oracle database instance by specifying neither username or password (i.e. rman target /), thus eliminating the need to store or retrieve an SYSDBA password.</p> <p><b>Oracle 12c</b> For Oracle 12c and later versions of Oracle, the delphix_os user can also use OSBACKUPDBA as its secondary group. This is typically the BACKUPDBA group on the host.</p>
For secondary group requirements, the Delphix OS user must be a member of the SYSBACKUP OS group (12.1 or higher) or the SYSDBA OS group (11.2 and lower).	This ensures that the Delphix engine is able to take snapshots of source databases using RMAN.
There must be a directory on the source host where the Delphix Engine Toolkit can be installed, for example: /var/opt/delphix/toolkit	<p>The delphix_os user and primary OS group (i.e. oinstall) must own the directory.</p> <p>The directory must have at least permissions -rwxr-x-- (0750)</p> <p>The delphix_os user must have -rwxr-x-- (0750) permissions on each directory in the path leading to the toolkit directory.</p> <p>At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.</p>
The Delphix Engine must be able to make an SSH connection to the source host (typically port 22).	
Read access to \$ORACLE_HOME and all underlying files and directories.	Delphix needs to run locally available Oracle tools such as sqlplus and RMAN. Those executables, as well as various required libraries, reside inside the Oracle home

### Additional requirements for RAC environments

If the source host is part of a RAC cluster, Delphix will attempt to use all nodes and crsctl for its operations.

RAC environment requirement	Explanation
The delphix_os user and Delphix Toolkit configuration must be the same on each node in the RAC cluster	<ul style="list-style-type: none"> <li>delphix_os must have a execute permission on crsctl and srvctl on each node in the cluster.</li> <li>access to olsnodes is needed.</li> <li>The Delphix Toolkit must be installed in the same directory path on each of the nodes in the source cluster.</li> <li>All data files, archive logs, and database control file must be located on storage shared by all of the cluster nodes.</li> <li>Each node in the cluster must be able to access archive logs and the database control file from all other nodes.</li> <li>At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.</li> </ul>

 **Masked Provisioning**  
 Masked Provisioning is supported on Oracle RAC only when used with "script-based masking".

**Auto-discovery requirements**

The preferred way to find source databases is to allow Delphix to automatically discover your Oracle Homes and Databases by examining the inventory and oratab files and the listener setup. Successful autodiscovery requires read access to these and related files.

In **most** environments, delphix\_os group membership is sufficient to perform auto-discovery.

However, if you have overridden Oracle's group permission structure, you may need to modify privileges to allow auto-discovery.

Auto-discovery requirements	Explanation
The ORATAB file must exist (typically in /etc/oratab or /var/opt/oracle/oratab) and be readable by delphix_os.  Read access to: <ul style="list-style-type: none"> <li>/etc/orainst.loc or /var/opt/oracle/orainst.loc.</li> <li>the Oracle inventory file (inventory.xml)</li> </ul>	The ORATAB is used to determine the location of the Oracle installations on your host.  Note: The Oracle inventory file is identified by the contents of orainst.loc (for example, \$INVENTORY_HOME/ContentsXML/inventory.xml).
Permission to run pargs on Solaris hosts and ps on AIX, HP-UX, and Linux hosts, as super-user. This permission is usually granted via sudo authorization of the commands.	Unless you have used a custom TNS_ADMIN setting, elevated access to ps (pargs on Solaris) is not required  See the topic <a href="#">Sudo Privilege Requirements for Oracle Environments</a> for further explanation of this requirement, and <a href="#">Sudo File Configuration Examples for Oracle Environments</a> for examples of file configurations

## Source database requirements

For each source database, there are specific configurations required for Delphix to ingest data.

Source database requirement	Explanation
For each Oracle Home, the delphix_os user should have execute permission for the programs in \$ORACLE_HOME/bin.	<p>If symlinks are configured, Delphix must be configured with the same \$ORACLE_HOME path as was used when starting the instance.</p> <p>Ensure the PermitUserEnvironment configuration parameter = "yes" in the sshd_config file</p> <p>The \$ORACLE_HOME/bin/oracle executable must have the SETUID and SETGID flags set. Permissions on the oracle binary must be at least -rwsr-s-x (06751).</p>
Source databases must be in ARCHIVELOG mode to ensure that redo logs are archived.	Archive logs are required to make SnapSyncs consistent and provisionable.
Enable Block Change Tracking (BCT). (Highly Recommended).	Enabling BCT will improve SnapSync operation time. Without BCT, incremental SnapSyncs must scan the entire database.
Enable FORCE LOGGING. (Highly Recommended)	<p>If you do not enable FORCE LOGGING and NOLOGGING operations take place, you will get a Fault from the Delphix Engine.</p> <p>If you must use NOLOGGING to meet specific performance criteria, take a new snapshot of the source database after doing the NOLOGGING operations to bring the dSource up-to-date before provisioning VDBs.</p>
If the online redo log files are located on RAW or ASM devices, then LogSync can only operate in Archive Only mode.	See the topics <a href="#">Advanced Data Management Settings for Oracle dSources</a> and <a href="#">Linking Oracle Physical Standby Databases</a> for more information.

## Operating system specific requirements

### Solaris

On a Solaris host, gtar must be installed. Delphix uses gtar to handle long file names when extracting the toolkit files into the toolkit directory on a Solaris host. The gtar binary should be installed in one of the following directories:

- / bin:/usr
- / bin:/sbin:/usr
- / sbin:/usr/contrib
- / bin:/usr/sfw
- / bin:/opt/sfw
- / bin:/opt/csw/bin

## Additional target /staging host requirements

This topic describes the user privileges and environment requirements that are required for Oracle target hosts and databases collectively referred to as target environments.

These are in addition to the ‘Oracle Hosts and Database Requirements’ called out above.

Target/Staging host requirement	Explanation
The Delphix OS user must be a member of the SYSDBA OS group.	This ensures that the Delphix engine is able to create new VDBs on target hosts.
There must be a directory (e.g. "/mnt/provision/" or "/mnt/staging/") that will be used as a container for the NFS mount points that are created when provisioning a VDB.	<p>The delphix_os user and primary OS group (i.e. oinstall or dba) must own the directory.</p> <p>The directory must have at least permissions -rwxrwx--- (0770).</p> <p>There must be no symbolic links in the path of this directory, because NFS can mount into a directory with symlinks in its path, but cannot unmount.</p>
Permission to run: <ul style="list-style-type: none"> <li>• mount, umount, mkdir, rmdir as super-user.</li> <li>• pargs on Solaris hosts</li> <li>• ps on Linux, AIX, and HP-UX as super-user.</li> <li>• nfso on AIX hosts as super-user</li> </ul>	The following permissions are usually granted via sudo authorization of the commands. See <a href="#">Sudo Privilege Requirements for Oracle Environments</a> for further explanation of the commands, and <a href="#">Sudo File Configuration Examples for Oracle Environments</a> for examples of the /etc/sudoers file on different operating systems.
Optional write permission to the \$ORACLE_BASE_CONFIG/dbs directory	<p>If write permission is granted, an instance init file will be written to this directory during provisioning that will simplify manual instance startup.</p> <p>If write permission is not granted, manual instance startup must specify the instance init file. See <a href="#">Manually Starting a VDB</a></p>
An Oracle listener process running on the target host for provisioning a VDB	The listener's version should be equal to or greater than the highest Oracle version that will be used to provision a VDB.
Required packages on target hosts: <ol style="list-style-type: none"> <li>1. portmapper / rpcbind</li> <li>2. status daemon (rpc.statd)</li> <li>3. NFS lock manager (rpc.lockd/lockmgr)</li> </ol>	As the Delphix Engine uses NFSv3 for mounting target host filesystems, the prerequisite packages to support NFSv3 client communication are required for normal operation, and the required services to support NFS client communications (including file locking) must be running. NFSv3 is enabled by default and to enable NFSv4, see <a href="#">NFSv4 Configuration</a>

Target/Staging host requirement	Explanation
If using ASM, the delphix_os user must have the Oracle ASM ownership groups as secondary OS groups (typically asmadmin and asmdba)	This ensures the Delphix engine can fully and automatically discover Oracle homes, databases, and listeners.

## Deploy hostchecker to validate Delphix requirements

Delphix has developed a hostchecker script that contains standardized checks for source and target hosts - these checks generally fall into three buckets

- OS and Host permissions/access
- Network Port Checks
- DB-specific functionality

OS and Host permissions/access and network port checks can (and should) be performed prior to Delphix installation to ensure a smooth deployment.

Each DB should have a specifically associated hostchecker - you can find detailed documentation on the DB-specific hostchecker page.

1. Download the appropriate **HostChecker tarball** for your engine from <https://download.delphix.com/> Tarballs follow the naming convention "hostchecker\_<OS>\_<processor>.tar". For example, if you are validating a linux x86 host you should download the hostchecker\_linux\_x86.tar tarball.
2. Create a working directory and extract the **HostChecker files** from the **HostChecker tarball**.

```
mkdir dlpX-host-checker
cd dlpX-host-checker/
tar -xf hostchecker_linux_x86.tar
```

3. Run the `sh` script contained within:

```
sh hostchecker.sh
```

This will extract the JDK included in the tarball (if necessary) and invoke the HostChecker.

```
ora10205@bbdhcp:/home/ora10205/hostchecker-> sh hostchecker.sh
Extracting the JDK from the tarball jdk-6u45-linux-i586.tar.gz.
```

### Warning:

#### Don't run as root

Do not run the HostChecker as root; this will cause misleading or incorrect results from many of the checks.

4. Select which **checks** you want to run.

#### Note:

Run Tests without the Interface

You can also run checks without spawning the interface. Enter `--help` to get a list of arguments you can pass to the HostChecker.

5. As the checks are made, enter the requested **arguments**.

6. Read the output of the check. The general format is that severity increases as you scroll down the output. First comes informational output, then warnings, then errors.

**Note:**

Internal Errors

If you see a message that starts with `Internal Error`, forward it to Delphix Support immediately. This represents a potential bug in the HostChecker, and not necessarily a problem with your environment.

7. Error or warning messages will explain any possible problems and how to address them. Resolve the issues that the HostChecker describes. Do not be surprised or undo your work if more errors appear the next time you run HostChecker, because the error you just fixed may have been masking other problems.
8. Repeat steps 3 - 7 until all the checks return no errors or warnings.

## Adding Oracle source and target environments

Follow the steps below to add **both** source and target environments for Oracle.

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Plus** icon next to **Environments**.
5. In the **Add environment** dialog, select **Unix/Linux**.
6. Select **Standalone host** or **Oracle cluster**, depending on the type of environment you are adding.
7. For standalone Oracle environments enter the **Host IP** address.
8. For Oracle RAC environments, enter the **Node address** and **Cluster home**.
9. Enter an optional **Name** for the environment.
10. Enter the **SSH** port. The default value is **22**.
11. Enter a **Username** for the environment. See [Requirements for Oracle Target Hosts and Databases](#) for more information on the required privileges for the environment user.
12. Select a Login Type: — Username and Password - enter the OS username and password, or — Username and Public Key - enter the OS username. — Password Vault - select from an existing Enterprise Password Vault

**Note:****Using public key authentication**

If you want to use public-key encryption for logging into your Unix-based environment:

- a. Select **Public key** for the **Login type**.
- b. Click **View public key**.
- c. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you will need to create it.
  - i. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by the user).
  - ii. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
  - iii. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.

The public key needs to be added only once per user and per environment.

13. For **Password login**, click **Verify credentials** to test the username and password.
14. Enter a **Toolkit path**. The toolkit directory stores scripts used for Delphix Engine operations, and should have a persistent working directory rather than a temporary one. The toolkit directory will have a separate subdirectory for each database instance. The toolkit path must have 0770 permissions and at least 345MB of free space.
15. Click **Submit**.

## Linking an Oracle data source

1. Login to the **Delphix management** application.
2. Navigate to **Manage > Datasets**.
3. Click the plus icon and select **Add dSource**.
4. In the **Add dSource** wizard, select the source database with the correct environment user-specified.
5. Enter your login credentials for the source database and click **Verify credentials**. If you are linking a mounted standby, Click **Next**. See the topics under [Linking Oracle Physical Standby Databases](#) for more information about how the Delphix Engine uses non-SYS login credentials.
6. Enter a name and select a group for your dSource. Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups](#) for more information.
7. Select the **Data management** settings needed. For more information, visit [Data Management Settings for Oracle Data Sources](#)
8. Assign existing policies to the new dSource. New policies can be created and associated later.
9. Enter any scripts that should be run using the **Hooks** page.
10. Review the dSource Configuration and Data Management information, and then click **Submit**.

Once the action to add a dSource has been submitted, the Delphix Engine will initiate a DB\_Link job to create the dSource. If the *Load Immediately* option was selected in the data management page a DB\_Sync job will also be executed to ingest data from the source, otherwise, this first DB\_Sync job will run as per the associated SnapSync policy.

When the jobs have successfully completed, the database icon will change to a dSource icon on the Environments > Databases screen, and the dSource will be added to the list of Datasets under its assigned group.

## Provisioning an Oracle VDB

1. Login to the **Delphix management** application.
2. Select **Manage > Datasets**.
3. In the **Datasets** panel on the left-hand side, click the **group** containing the dSource or VDB from which you want to provision.
4. Click the **TimeFlow** tab.
5. Select a **snapshot**.

**Note:**

You can take a snapshot of the dSource from which to provision. To do so, click the **Camera** icon.

6. **Optional:** Select  to open LogSync timeline.

7. Select  to provision from a point of time within a snapshot. You can select by date or time.
8. Click  and the **Provision VDB**wizard will open:
  - a. For **Oracle single instance** the fields **Installation home, Database unique name, SID, Database name, Mount base,** and **Environment user** will auto-populate with information from the parent.
  - b. For **Oracle RAC** the fields **Installation home, Database unique name, SID, Database name, Mount base, Instance number, Instance name** and **Environment user** will auto-populate with information from the parent.

**Note:**  
 Editable Fields in the VDB Provision Wizard  
 The following fields are editable:  
 Installation Home (need to have an additional compatible target)  
 Database Unique Name  
 SID  
 Database Name  
 Mount Base  
 Instance Number (RAC Only)  
 Instance Name (RAC Only)
9. If you need to add a new target environment for the VDB, click the green **Plus** icon next to the **Filter target** field, and follow the instructions in [Adding an Oracle Single Instance or RAC Environment](#)
10. Review the information for **Installation home, Database unique name, SID,** and **Database name.** Edit as necessary.
11. Review the **Mount base** and **Environment user.** Edit as necessary. The Environment User must have permission to write to the specified Mount Base, as described in [Requirements for Oracle Target Hosts and Databases.](#) You may also want to create a new writeable directory in the target environment with the correct permissions and use that as the Mount Base for the VDB.

12. Select **Provide privileged credentials** if you want to use login credentials on the target environment that are different from those associated with the **Environment user**.
13. Click **Advanced** to customize the VDB online log size and log groups, archivelog mode, local\_listener parameter (TCP/IPC protocol addresses), additional VDB configuration settings or file mappings, or custom environment variables. For more information, see [Customizing Oracle VDB Configuration Settings](#), [Customizing VDB File Mappings](#), and [Customizing Oracle VDB Environment Variables](#). If you are provisioning to a target environment that is running a Linux OS, you will need to compare the `SGA_TARGET` configuration parameter with the shared memory size in `/dev/shm`. The shared memory configured on the target host should match the SGA memory target. You can check the Linux OS shared memory size with the command `df -k /dev/shm` and the `SGA_TARGET` configuration parameter by opening the **Advanced** settings and then finding the value for `SGA_TARGET` under **VDB Configuration templates**.
14. Click **Next**.
15. Select a **Target group** for the VDB.
16. Enable Auto VDB Restart to allow the VDB to be automatically restarted when the target host reboot is detected by Delphix.
17. Click **Next**.
18. Select a **Snapshot policy** for the VDB.
19. Click **Next**.
20. Enter any operations that should be run at Hooks during the provisioning process. Click **Next**.
21. Click **Submit**.

When provisioning starts, you can review the progress of the job by selecting the VDB and clicking on the **Status** tab, or by selecting **Manage/Dashboards** and viewing the **Job history** panel. Alternatively, you could see this in the **Actions sidebar**. When provisioning is complete, the VDB will be included in the group you designated and listed in the **Datasets** panel. If you select the VDB in the **Datasets** panel and click the **Configuration** tab, you can view information about the database and its Data Management settings.

## Next steps

Congratulations! You've provisioned your first virtual database!

You should attempt some simple functional tests with your application. You can connect your app to the VDB using standard TNS/JDBC techniques. Delphix has already registered the VDB for you on the Target listener.

We suggest the following next steps:

- dropping a table and using the VDB Rewind feature to test recovery of your VDB
- Take a snapshot of your dSource and Refresh your VDB to quickly get fresh production data
- Provision a new VDB from your VDB to test sharing data quickly with other teams
- Mask your new VDB to protect sensitive data. Provision new VDBs from that Masked VDB to quickly provide safe data to development and QA teams.

## Oracle support matrix

### Disclaimers and Support Notes

Delphix Support Policies specifically list **major** and **minor** release coverage. If a minor release is listed as covered, all patch releases under that minor release are certified. Support applies to corresponding versions of Community Enterprise Operating System (CentOS) / Oracle Linux (OL), 64-bit OS support only.

The Oracle version in the support matrix applies to both Oracle DB and Oracle Grid. Delphix supports the same set of features and functionality for supported non-multi-tenant database versions. Currently, Delphix does not support the Oracle 12c feature of `THREADED_EXECUTION` being set to `TRUE`, because this disables OS authentication.

Summary of Delphix features that are unsupported for the Oracle12c and higher Multi-tenant configuration:

- Existing Virtual Container Database (vCDB) as target for provisioning an additional vPDB for Oracle version 12.1.0.1
- Customize VDB settings/initialization parameters. Includes the following:
  - Customize `init.ora` database parameter during provisioning
  - Config templates
  - Online redo log size
  - Number of RAC VDB instances
  - Online redo log groups
  - Archive log mode
  - Setting new DBID
  - Customize local listeners
- Virtual to Physical (V2P) Support
- Resumable initial SnapSync
- Validated Sync
- Source continuity for dSource upgraded from Oracle 12c non-multitenant to multitenant database
- Cross-platform provisioning (XPP) to the virtual database
- Oracle LiveSources

Delphix supports systems that are part of an Exadata or Exadata Cloud-at-Customer (ExaCC) cluster, provided that the operating system and DBMS version are in the supported list. Oracle Exadata, Exadata Cloud, and Exadata Cloud-at-Customer (ExaCC) offer several features that are reliant on the underlying Exadata storage. Delphix supports creating dSources from Exadata source clusters and provisioning VDBs and vPDBs to Exadata target clusters.

The following Exadata-only features will not be available in child VDBs running in Delphix storage:

- Smart Scan - allows SQL processing to be offloaded to Exadata storage cells. Queries that leverage Smart Scan will execute successfully in VDBs but query performance may be impacted.
- Smart Flash Cache - allows frequently used data blocks to be stored in the flash cache of Exadata storage cells to allow for faster access. Queries against objects that are normally cached in Smart Flash Cache will execute successfully in VDBs but query performance may be impacted. As the virtualization engine uses memory to cache frequently used data blocks, allocating extra memory to the engine may help to mitigate this performance impact.
- Hybrid Columnar Compression (HCC) - compresses data and stores it in a columnar format, allowing Exadata storage cells to deliver faster query performance while also saving on storage. Columns compressed using HCC cannot be used by queries executed in VDBs. Affected columns can be decompressed though care should be taken to evaluate the impact of doing so on VDB refresh times and Delphix storage usage. In Delphix VDBs, queries against partitions or tables using HCC will fail with the following error *"ORA-64307: Exadata Hybrid Columnar Compression is not supported for tablespaces on this storage type"*.

Color	Supported?
Y	Yes
N	No
NA	Not Applicable

Oracle Database Editions

Delphix supports the following Oracle database editions:

- Enterprise
- Standard

Red Hat Enterprise Linux (RHEL)

 Support for RHEL 8.x requires installing the `libncurses.5` library onto the host. Please refer to [KBA 5622](#) for the required steps.

## Requirements for Oracle hosts and databases

### Oracle hosts and databases

To begin using Oracle environments in Delphix, reference this article as a provided outline of the configuration requirements for the source and target hosts.

On each host with Oracle, there must be an operating system user configured to the required specifications for Delphix, as explained in the table below. This user (i.e. delphix\_os) can easily be created by using the createDelphixOSUser.sh script (located at the bottom of the page).

These requirements apply to both source and target environments. However, target environments have additional requirements which are detailed in the 'Target Host Requirements' section below.

### Source host requirement

Host requirement	Explanation
Profile and privileges should be the same as the Oracle user (e.g. oracle) on the host.	For example, delphix_os should have the same environment variable settings (\$PATH, \$ORACLE_HOME, etc.), umask, and ulimit settings, as the user oracle.
The Delphix software owner account (e.g. delphix_os) must have the same primary OS group as the Oracle software owner account (e.g. oracle).	<p>Delphix recommends giving the delphix_os user the same primary OS group as the Oracle home owner. This ensures the Delphix engine can fully and automatically discover Oracle homes, databases, and listeners.</p> <p>Often, this is an OS group named oinstall. However, the oinstall group is not always necessary depending on your Oracle configuration. This user requires access to the libobk_proxy.so library in the toolkit for the child processes triggered by RMAN.</p>
The delphix_os user must have the Oracle OSDBA group (typically dba) as a primary or secondary OS group.	<p>The OSDBA group allows "OS authentication" when connecting to an Oracle database instance by specifying neither username or password (i.e. rman target /), thus eliminating the need to store or retrieve an SYSDBA password.</p> <p><b>Oracle 12c</b> For Oracle 12c and later versions of Oracle, the delphix_os user can also use OSBACKUPDBA as its secondary group. This is typically the BACKUPDBA group on the host.</p>
For secondary group requirements, the Delphix OS user must be a member of the SYSBACKUP OS group (12.1 or higher) or the SYSDBA OS group (11.2 and lower).	This ensures that the Delphix engine is able to take snapshots of source databases using RMAN.

Host requirement	Explanation
<p>There must be a directory on the source host where the Delphix Engine Toolkit can be installed, for example: <code>/var/opt/delphix/toolkit</code></p>	<p>The <code>delphix_os</code> user and primary OS group (i.e. <code>oinstall</code>) must own the directory.</p> <p>The directory must have at least permissions <code>-rwxr-x--</code> (0750)</p> <p>The <code>delphix_os</code> user must have <code>-rwxr-x--</code> (0750) permissions on each directory in the path leading to the toolkit directory.</p> <p>At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.</p>
<p>The Delphix Engine must be able to make an SSH connection to the source host (typically port 22).</p>	
<p>Read access to <code>\$ORACLE_HOME</code> and all underlying files and directories.</p>	<p>Delphix needs to run locally available Oracle tools such as <code>sqlplus</code> and <code>RMAN</code>. Those executables, as well as various required libraries, reside inside the Oracle home</p>

Additional requirements for RAC environments

If the source host is part of a RAC cluster, Delphix will attempt to use all nodes and `crsctl` for its operations.

RAC environment requirement	Explanation
<p>The <code>delphix_os</code> user and Delphix Toolkit configuration must be the same on each node in the RAC cluster</p>	<ul style="list-style-type: none"> <li>• <code>delphix_os</code> must have a execute permission on <code>crsctl</code> and <code>srvctl</code> on each node in the cluster.</li> <li>• access to <code>olsnodes</code> is needed.</li> <li>• The Delphix Toolkit must be installed in the same directory path on each of the nodes in the source cluster.</li> <li>• All data files, archive logs, and database control file must be located on storage shared by all of the cluster nodes.</li> <li>• Each node in the cluster must be able to access archive logs and the database control file from all other nodes.</li> <li>• At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.</li> </ul>

**Masked Provisioning**

Masked Provisioning is supported on Oracle RAC only when used with "script-based masking".

**Auto-Discovery Requirements**

The preferred way to find source databases is to allow Delphix to automatically discover your Oracle Homes and Databases by examining the inventory and oratab files and the listener setup. Successful autodiscovery requires read access to these and related files.

In **most** environments, delphix\_os group membership is sufficient to perform auto-discovery.

However, if you have overridden Oracle's group permission structure, you may need to modify privileges to allow auto-discovery.

Auto-discovery requirements	Explanation
<p>The ORATAB file must exist (typically in /etc/oratab or /var/opt/oracle/oratab) and be readable by delphix_os.</p> <p>Read access to:</p> <ul style="list-style-type: none"> <li>• /etc/orainst.loc or /var/opt/oracle/orainst.loc.</li> <li>• the Oracle inventory file (inventory.xml)</li> </ul>	<p>The ORATAB is used to determine the location of the Oracle installations on your host.</p> <p>Note: The Oracle inventory file is identified by the contents of orainst.loc (for example, \$INVENTORY_HOME/ContentsXML/inventory.xml).</p>
<p>Permission to run pargs on Solaris hosts and ps on AIX, HP-UX, and Linux hosts, as super-user.</p> <p>This permission is usually granted via sudo authorization of the commands.</p>	<p>Unless you have used a custom TNS_ADMIN setting, elevated access to ps (pargs on Solaris) is not required</p> <p>See the topic <a href="#">Sudo Privilege Requirements for Oracle Environments</a> for further explanation of this requirement, and <a href="#">Sudo File Configuration Examples for Oracle Environments</a> for examples of file configurations</p>

**Source database requirements**

For each source database, there are specific configurations required for Delphix to ingest data.

Source database requirement	Explanation
<p>For each Oracle Home, the delphix_os user should have execute permission for the programs in \$ORACLE_HOME/bin.</p>	<p>If symlinks are configured, Delphix must be configured with the same \$ORACLE_HOME path as was used when starting the instance.</p> <p>Ensure the PermitUserEnvironment configuration parameter = "yes" in the sshd_config file</p> <p>The \$ORACLE_HOME/bin/oracle executable must have the SETUID and SETGID flags set. Permissions on the oracle binary must be at least -rwsr-s-x (06751).</p>

Source database requirement	Explanation
Source databases must be in ARCHIVELOG mode to ensure that redo logs are archived.	Archive logs are required to make SnapSyncs consistent and provisionable.
Enable Block Change Tracking (BCT). (Highly Recommended).	Enabling BCT will improve SnapSync operation time. Without BCT, incremental SnapSyncs must scan the entire database.
Enable FORCE LOGGING. (Highly Recommended)	<p>If you do not enable FORCE LOGGING and NOLOGGING operations take place, you will get a Fault from the Delphix Engine.</p> <p>If you must use NOLOGGING to meet specific performance criteria, take a new snapshot of the source database after doing the NOLOGGING operations to bring the dSource up-to-date before provisioning VDBs.</p>
If the online redo log files are located on RAW or ASM devices, then LogSync can only operate in Archive Only mode.	See the topics <a href="#">Advanced Data Management Settings for Oracle dSources</a> and <a href="#">Linking Oracle Physical Standby Databases</a> for more information.

### Operating system specific requirements

#### Solaris

On a Solaris host, gtar must be installed. Delphix uses gtar to handle long file names when extracting the toolkit files into the toolkit directory on a Solaris host. The gtar binary should be installed in one of the following directories:

- / bin:/usr
- / bin:/sbin:/usr
- / sbin:/usr/contrib
- / bin:/usr/sfw
- / bin:/opt/sfw
- / bin:/opt/csw/bin

#### Additional target /staging host requirements

This topic describes the user privileges and environment requirements that are required for Oracle target hosts and databases collectively referred to as target environments.

These are in addition to the 'Oracle Hosts and Database Requirements' called out above.

Target/Staging host requirement	Explanation
The Delphix OS user must be a member of the SYSDBA OS group.	This ensures that the Delphix engine is able to create new VDBs on target hosts.

Target/Staging host requirement	Explanation
<p>There must be a directory (e.g. "/mnt/provision/" or "/mnt/staging/") that will be used as a container for the NFS mount points that are created when provisioning a VDB or linking a staging push dSource.</p>	<p>The delphix_os user and primary OS group (i.e. oinstall or dba) must own the directory.</p> <p>The directory must have at least permissions -rwxrwx--- (0770).</p> <p>There must be no symbolic links in the path of this directory, because NFS can mount into a directory with symlinks in its path, but cannot unmount.</p>
<p>Permission to run:</p> <ul style="list-style-type: none"> <li>• mount, umount, mkdir, rmdir as super-user.</li> <li>• pargs on Solaris hosts</li> <li>• ps on Linux, AIX, and HP-UX as super-user.</li> <li>• nfso on AIX hosts as super-user</li> </ul>	<p>The following permissions are usually granted via sudo authorization of the commands. See <a href="#">Sudo Privilege Requirements for Oracle Environments</a> for further explanation of the commands, and <a href="#">Sudo File Configuration Examples for Oracle Environments</a> for examples of the /etc/sudoers file on different operating systems.</p>
<p>Optional write permission to the \$ORACLE_BASE_CONFIG/dbs directory</p>	<p>If write permission is granted, an instance init file will be written to this directory during provisioning that will simplify manual instance startup.</p> <p>If write permission is not granted, manual instance startup must specify the instance init file. See <a href="#">Manually Starting a VDB</a></p>
<p>An Oracle listener process running on the target host for provisioning a VDB</p>	<p>The listener's version should be equal to or greater than the highest Oracle version that will be used to provision a VDB.</p>
<p>Required packages on target hosts:</p> <ol style="list-style-type: none"> <li>1. portmapper / rpcbind</li> <li>2. status daemon (rpc.statd)</li> <li>3. NFS lock manager (rpc.lockd/lockmgr)</li> </ol>	<p>As the Delphix Engine uses NFSv3 for mounting target host filesystems, the prerequisite packages to support NFSv3 client communication are required for normal operation, and the required services to support NFS client communications (including file locking) must be running. NFSv3 is enabled by default and to enable NFSv4, see <a href="#">NFSv4 Configuration</a></p>
<p>If using ASM, the delphix_os user must have the Oracle ASM ownership groups as secondary OS groups (typically asmadmin and asmdba)</p>	<p>This ensures the Delphix engine can fully and automatically discover Oracle homes, databases, and listeners.</p>

## Scripts

- [createDelphixOSUser.sh](#)
- [createDelphixDBUser.sh](#)

## Network and connectivity requirements for Oracle environments

### General port allocation

The Delphix Engine makes use of the following network ports regardless of the type of database platform:

### General outbound from the Delphix engine port allocation

Protocol	Port numbers	Use
TCP	25	Connection to a local SMTP server for sending email
TCP/UDP	53	Connections to local DNS servers
UDP	123	Connection to an NTP server
UDP	162	Sending SNMP TRAP messages to an SNMP Manager
TCP	443	HTTPS connections from the Delphix Engine to the Delphix Support upload server
TCP/UDP	636	Secure connections to an LDAP server
TCP	8415	Connections to a Delphix replication target. See <a href="#">Configuring Replication</a>
TCP	50001	Connections to source and target environments for network performance tests.

### General inbound to the Delphix engine port allocation

Protocol	Port number	Use
TCP	22	SSH connections to the Delphix Engine
TCP	80	HTTP connections to the Delphix GUI
UDP	161	Messages from an SNMP Manager to the Delphix Engine
TCP	443	HTTPS connections to the Delphix Management Application

Protocol	Port number	Use
TCP	8415	Delphix Session Protocol connections from all DSP-based network services including Replication, SnapSync for Oracle, V2P, and the Delphix Connector.
TCP	50001	Connections from source and target environments for network performance tests via the Delphix CLI.

### Firewalls and intrusion detection systems (IDS)

Production databases on source environments (for dSources) are often separated from the non-production environment by firewalls. Firewalls can add milliseconds to the latency between servers. Accordingly, for best performance, there should be no firewalls between the Delphix Engine and the virtual database (VDB) target environments. If the Delphix Engine is separated from a source environment by a firewall, the firewall must be configured to permit network connections between the Delphix Engine and the source environments for the application protocols (ports) listed above.

Intrusion detection systems (IDSs) should also be made permissive to the Delphix Engine deployment. IDSs should be made aware of the anticipated high volumes of data transfer between dSources and the Delphix Engine.

### SSHD configuration

Both source and target Unix environments are required to have `sshd` running and configured such that the Delphix Engine can connect over `ssh`.

The Delphix platform expects to maintain long-running, highly performant `ssh` connections with remote Unix environments. The following `sshd` configuration entries can interfere with these `ssh` connections and are therefore disallowed:

Disallowed <code>sshd</code> configuration entries
<code>ClientAliveInterval</code>
<code>ClientAliveCountMax</code>

### Network and connectivity requirements for Oracle

- IP connections must exist between the Delphix Engine and the source and target environments.
- For source environments, Delphix Engine uses an **SSH** connection to each source host, an **HTTP** connection from each source environment to Delphix Engine, and a DSP connection to the Delphix Engine. The Delphix Engine uses **SQLNet** connections to the DBMS on the source environment.
- For target environments, Delphix uses an **SSH** connection to each target environment and an **NFS** connection to Delphix Engine. Delphix Engine uses **SQLNet** connections to the virtual databases on the target environment.

#### scp Availability

The **scp** program must be available in the environment in order to add an environment.

Port allocation for Oracle environments

The following diagram describes the port allocations for Oracle environments. It illustrates the ports that we recommend to be open from Delphix to remote services, to the Delphix Engine, and to the Target Environments.

Port allocation for Oracle environments

**Note:** \*Oracle listener typically runs on TCP port 1521. In cases where other ports are used, substitute for 1521 above. Starting with 6.0.7.0 release, this port is required only if database user credentials are provided. The port need not be open if no database user credentials are provided.

The Delphix Engine makes use of the following network ports for Oracle dSources and VDBs:

Outbound from the Delphix engine port allocation

Protocol	Port numbers	Use
TCP	22	SSH connections to source and target environments
TCP	xxx	Connections to the Oracle SQL*Net Listener on the source and target environments (typically port 1521)

## Inbound to the Delphix engine port allocation

Protocol	Port number	Use
TCP/UDP	111	Remote Procedure Call (RPC) port mapper used for NFSv3 mounts  Note: RPC calls in NFSv3 use additional fixed ports for supporting services (lockd, mountd and statd) seen below.
TCP	1110	NFSv3 Server daemon status and NFS server daemon keep-alive (client info)
TCP/UDP	2049	NFS Server daemon from VDB to the Delphix Engine (used for both NFSv3 and NFSv4)
TCP	8341	Sending data from source to the Delphix Engine (for LogSync)
TCP	8415	SnapSync control and data from source to the Delphix Engine  V2P control and data from the target environment to the Delphix Engine.
TCP	54043	NFSv3 mount daemon
TCP	54044	NFSv3 stat daemon (lock state notification service)
TCP	54045	NFSv3 lock daemon/manager
UDP	33434 - 33464	Traceroute from source and target database servers to the Delphix Engine (optional)

## AppData port requirements

The use of AppData requires the following ports/protocols. Two important notes about these specifications:

1. The next release of the Delphix Engine will significantly augment the port/protocol utilization of AppData. The upcoming-only requirements have been marked with a \*.
2. AppData V2P uses RSYNC to export to the target. RSYNC between the target and Delphix Engine is not required for general virtualization usage. The V2P-only requirements have been marked with a ^.

<b>From source to Delphix engine</b>	<b>From Delphix engine to source</b>	<b>From target to Delphix engine</b>	<b>From Delphix engine to target</b>
RSYNC (TCP Port 873)	RSYNC (TCP Port 873)	DSP (Default TCP Port 8415)	DSP (Default TCP Port 8415)
DSP (Default TCP Port 8415)	SSH (TCP Port 22)	NFS	SSH (TCP Port 22)
*NFS	DSP (Default TCP Port 8415)	^RSYNC (TCP Port 873)	^RSYNC (TCP Port 873)

## Sudo privilege requirements for Oracle environments

This topic describes the rationale behind specific `sudo` privilege requirements for virtualizing Oracle Databases.

Privilege	Sources	Targets	Rationale
<code>ps   pargs</code>	Optional, Strongly Recommended	Optional, Strongly Recommended	<p>Delphix auto-discovery uses the <code>TNS_ADMIN</code> environment variable of Oracle Listener processes with non-standard configurations to derive their connection parameters. A different user (oracle), rather than <b>delphix_os</b> user normally owns the oracle listener. The Delphix Engine needs <code>sudo</code> access to <code>pargs</code> on the Solaris OS or <code>ps</code> on other OSes to determine the environment variables of those Listener processes.</p> <p>This privilege is required for Auto-Discovery with non-default <code>TNS_ADMIN</code> locations. It is optional when using a standard <code>TNS_ADMIN</code> location, or if you choose to manually configure Oracle Homes, databases and listeners.</p>
<code>mount/umount</code>	Not Required	<b>Required</b>	<p>The Delphix Engine dynamically mounts and unmounts directories under the provisioning directory during VDB operations. This privilege is required because <code>mount</code> and <code>umount</code> are typically reserved for superuser.</p>
<code>nfso</code> (AIX only)	Not Required	<b>Required</b>	<p>The Delphix Engine monitors NFS read and write sizes on an AIX target host. It uses the <code>nfso</code> command to query the sizes in order to optimize NFS performance for VDBs running on the target host. Only a superuser can issue the <code>nfso</code> command.</p>

 It is required to specify the NOPASSWD qualifier within the "sudo" configuration file, as shown here: [Sudo File Configuration Examples for Oracle Environments](#). This ensures that the "sudo" command does not demand the entry of a password, even for the "display permissions" (i.e. "sudo -l") command. Delphix issues "sudo -l" in some scripts to detect if the operating system user has the correct sudo privileges. If it is unable to execute this command, some actions may fail and Delphix will raise an alert suggesting it does not have the correct sudo permissions. Restricting the execution of "sudo -l" by setting "listpw=always" in the "/etc/sudoers" file **when the Delphix operating system user is configured to use**

**public key authentication** will cause the Delphix operating system user to be prompted for a password which will fail certain Delphix actions. Use a less restrictive setting for listpw than "always" when the Delphix operating system user is using public-key authentication.

Oracle mount options for RAC	
AIX	<code>cio,rw,bg,hard,nointr,timeo=600,proto=tcp,nosuid,noac</code>
HPUX	<code>rw,bg,hard,rsize=1048576,wsiz=1048576,nointr,timeo=600,proto=tcp,nosuid,forcedirectio,noac</code>
Solaris	<code>rrw,bg,hard,rsize=1048576,wsiz=1048576,nointr,proto=tcp,nosuid,forcedirectio,noac</code>
For the above platforms, depending on NFS version used, additional options vers=3 or vers=4.x is added (x varies depending on what that platform supports. e.g. vers=4 or vers=4.1)	
Linux (NFSv3)	<code>-t nfs rw,bg,hard,rsize=1048576,wsiz=1048576,nointr,timeo=600,tcp,nosuid,sec=sys,vers=3,actimeo=0</code>
Linux (NFSv4)	<code>-t nfs4 rw,bg,hard,rsize=1048576,wsiz=1048576,nointr,timeo=600,tcp,nosuid,sec=sys,actimeo=0</code>

- ⚠ 1. For both Single instance and RAC, "port=2049" option is added for all platforms.
- 2. For AIX, rsize=<value>,wsiz=<value> options are added depending on the value returned by "/usr/sbin/nfso -o nfs\_max\_read\_size" and "/usr/sbin/nfso -o nfs\_max\_write\_size" commands.

**Oracle unmount options**

"-f" is used for all platforms. For Linux, "-lf" is used.

**Oracle mount options for single instance**

AIX	<code>cio,rw,bg,hard,intr,timeo=600,proto=tcp,nosuid</code>
-----	-------------------------------------------------------------

Oracle mount options for single instance	
HPUX	<code>rw,bg,hard,rsize=1048576,wsiz=1048576,nointr,timeo=600, proto=tcp,nosuid,forcedirectio</code>
Solaris	<code>rw,bg,hard,rsize=1048576,wsiz=1048576, nointr,proto=tcp,nosuid,forcedirectio</code>
For the above platforms, depending on NFS version used, additional options vers=3 or vers=4.x is added (x varies depending on what that platform supports. e.g. vers=4 or vers=4.1)	
Linux (NFSv3)	<code>-t nfs rw,bg,hard,rsize=1048576,wsiz=1048576,nointr,timeo=600,tcp, nosuid,sec=sys,vers=3</code>
Linux (NFSv4)	<code>-t nfs4 rw,bg,hard,rsize=1048576,wsiz=1048576,nointr,timeo=600,tc p,nosuid,sec=sys</code>

## Sudo file configuration examples for Oracle environments

This topic provides a sample `sudo` file privilege configurations for using the Delphix Engine with various operating systems and the Oracle RDBMS.

### **Requiretty settings**

Delphix requires that the `requiretty` setting be disabled for all Delphix users with `sudo` privileges.

### Configuring `sudo` access on Solaris SPARC for Oracle source and target environments

Sudo access to `pargs` on the Solaris operating system is required for the detection of listeners with non-standard configurations on both source and target environments. Super-user access level is needed to determine the `TNS_ADMIN` environment variable of the user running the listener (typically **oracle**, the installation owner). From `TNS_ADMIN`, the Delphix OS user **delphix\_os** can derive connection parameters.

Example: Solaris `/etc/sudoers` entries for a Delphix Source

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD:/usr/bin/pargs
```

On a Solaris target, `sudo` access to `mount` and `umount` is also required.

Example: Solaris `/etc/sudoers` entries for a Delphix Target

```
# Delphix issues sudo -l so we need to allow it via listpw. Never set it to always
when using public key authentication
Defaults      listpw=all

User_Alias   DELPHIX_USER=delphix_os

Cmd_Alias   DELPHIX_CMDS= \
/usr/bin/mount, \
/usr/bin/umount, \
/usr/bin/mkdir, \
/usr/bin/rmdir, \
/usr/bin/pargs

DELPHIX_USER ALL=(ALL) NOPASSWD: DELPHIX_CMDS
```

### Configuring `sudo` access on Linux for Oracle source and target environments

Sudo access to `ps` on the Linux operating system is required for the detection of listeners with non-standard configurations on both source and target environments. Super-user access level is needed to determine the `TNS_ADMIN` environment variable of the user running the listener (typically **oracle**, the installation owner). From `TNS_ADMIN`, the Delphix OS user **delphix\_os** can derive connection parameters.

Example: Linux `/etc/sudoers` entries for a Delphix Source

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD:/bin/ps
```

On a Linux target, sudo access to `mount` and `umount` is also required.

Example: Linux `/etc/sudoers` file for a Delphix Target

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/bin/mount, /bin/umount, /bin/mkdir, /bin/rmdir, /bin/ps
```

Configuring `sudo` access on AIX for Oracle source and target environments

Sudo access to `ps` on the AIX operating system is required for the detection of listeners with non-standard configurations on both source and target environments. Super-user access level is needed to determine the `TNS_ADMIN` environment variable of the user running the listener (typically **oracle**, the installation owner). From `TNS_ADMIN`, the Delphix OS user **delphix\_os** can derive connection parameters.

Example: AIX `/etc/sudoers` entries for a Delphix Source

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD:/bin/ps
```

In addition to sudo access to the `mount`, `umount`, and `ps` commands on AIX target hosts, Delphix also requires `sudo` access to `nfso`. This is required on target hosts for the Delphix Engine to monitor the NFS read-write sizes configured on the AIX system. Super-user access level is needed to run the `nfso` command.

Example: AIX `/etc/sudoers` File for a Delphix Target

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD: \
/usr/sbin/mount, \
/usr/sbin/umount, \
/usr/sbin/mkdir, \
/usr/sbin/rmdir, \
/usr/sbin/nfso, \
/usr/bin/ps
```

Configuring `sudo` access on HP-UX for Oracle source and target environments

No `sudo` privileges are required on source environments running HP-UX. The HP-UX OS does not allow the **delphix\_os** user to determine the `TNS_ADMIN` environment variable setting for the **oracle** user. This means that the Delphix Engine cannot auto-discover non-standard listener configurations with non-default `TNS_ADMIN` settings.

On the HP-UX target, `sudo` access to `mount` and `umount` is required as with other operating systems.

### Example: HP-UX /etc/sudoers file for a Delphix target

Example: AIX /etc/sudoers File for a Delphix target

```
Defaults:delphix_os !requiretty
delphix_os ALL=NOPASSWD:/sbin/mount, /sbin/umount, /sbin/mkdir, /sbin/rmdir
```

Examples of Limiting `sudo` Access for the Delphix OS User

In situations where security requirements prohibit giving the Delphix user root privileges to `mount`, `umount`, `mkdir`, and `rmdir` on the global level, it is possible to configure the `sudoers` file to provide these privileges only on specific mount points or from specific Delphix Engines, as shown in these two examples.

**i** The Delphix Engine tests its ability to run the `mount` command using `sudo` on the target environment by issuing the `sudo mount` command with no arguments. Many of the examples shown in this topic do not allow that. This causes a warning during environment discovery and monitoring but otherwise does not cause a problem. If your VDB operations succeed, it is safe to ignore this warning. Similarly, the `ps` or `pargs` command is used for target environment operations such as initial discovery and refresh. The most restrictive sudo setups might not allow the commands `ps` (`pargs`). Delphix can still function without these privileges, although auto-discovery may not work. However, some users configure the security on the target environments to monitor `sudo` failures and lockout the offending account after some threshold. In those situations, the failure of the sudo commands might cause the **delphix\_os** account to become locked. One workaround for this situation is to increase the threshold for locking out the user account. Another option is to modify `/etc/sudoers` to permit the **delphix\_os** user to run `ps` (`pargs`), and `mount` command without parameters.

**f** Note that the following examples are for illustrative purposes and the sudo file configuration options are subject to change.

#### Example 1

This example restricts the **delphix\_os** user's use of `sudo` privileges to the directory `/oracle`.

Note that wildcards are allowed for the options on `mount` and `umount` because those commands expect a fixed number of arguments after the options. The option wildcard on the `mount` command also makes it possible to specify the file-system being mounted from the Delphix Engine.

Example /etc/sudoers File Configuration on the Target Environment for sudo Privileges on the VDB Mount Directory Only (Linux OS)

```
Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: \
/bin/mount * /oracle/*, \
/bin/umount * /oracle/*, \
/bin/umount /oracle/*, \
/bin/mkdir -p /oracle/*, \
```

```

/bin/mkdir -p -m 755 /oracle/*, \
/bin/mkdir      /oracle/*, \
/bin/rmdir      /oracle/*, \
/bin/ps

```

Example /etc/sudoers File Configuration on the Source Environment to grant Super-User privileges when running PS

```

Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: /bin/ps

```

## Example 2

This example restricts the **delphix\_os** user's use of `sudo` privileges to the directory `/oracle`, restricts the mount commands to a specific Delphix Engine hostname and IP, and does not allow user-specified options for the `umount` command.

This configuration is more secure, but there is a tradeoff with deployment simplicity. This approach would require a different sudo configuration for targets configured for different Delphix Engines.

A Second Example of Configuring the /etc/sudoers File on the Target Environment for Privileges on the VDB Mount Directory Only (Linux OS)

```

Defaults:delphix_os !requiretty
delphix_os ALL=(root) NOPASSWD: \
/bin/mount      <delphix-server-name>* /oracle/*, \
/bin/mount *    <delphix-server-name>* /oracle/*, \
/bin/mount      <delphix-server-ip>* /oracle/*, \
/bin/mount *    <delphix-server-ip>* /oracle/*, \
/bin/mount "", \
/bin/umount     /oracle/*, \
/bin/umount *   /oracle/*, \
/bin/mkdir, \
/bin/rmdir, \
/bin/ps

```

## Managing Oracle environments and hosts

This section describes the attributes of Oracle-specific environments such as RAC Cluster Users, Listeners, and RAC configurations and covers the following topics:

- [Managing environment users](#)
- [Environment attributes for hosts with Oracle](#)
- [Adding an Oracle single instance or RAC environment](#)
- [Adding Oracle standalone and RAC targets in Kerberos](#)
- [Adding a database installation home to an Oracle environment](#)
- [Adding a database to an Oracle environment](#)
- [Adding a listener to an Oracle environment](#)
- [Enabling linking and provisioning for Oracle databases](#)
- [Linking an Oracle RAC source database using a standalone host environment](#)
- [Listener and JDBC verification](#)
- [Providing your own Oracle Java](#)
- [Changing the hostname or IP address for Oracle source and target environments](#)
- [How to change ORACLE\\_HOME](#)
- [CLI support for partial-full backup in Oracle](#)

## Managing environment users

### Procedure

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click on the existing **environment name** you want to modify.
5. In the Details tab under **Basic information**, click the **Plus** icon next to Environment Users to add a user.
6. Enter the **Username** and **Password** for the OS user in that environment.
7. Select **Add** to save the new user.
8. To change the primary user for this environment, click the **Pencil** icon next to **Environment users**. Only the primary user will be used for environment discovery.
9. To delete a user, click the **Trash** icon next to their username.

## Environment attributes for hosts with Oracle

This topic describes the attributes of Oracle-specific environments such as RAC Cluster Users, Listeners, and RAC configurations. You can manage these settings by the procedure described below.

1. Navigate to Manage > Environments.
2. In the Environments panel, click the name of an environment to view its attributes.
3. Next to Attributes, click the Pencil icon to edit an attribute.
  - For Oracle RAC environments select your node then click the Pencil icon.

### Common environment attributes

Attribute	Description
Environment users	The users for that environment. These are the users who have permission to ssh into an environment or access the environment through the Delphix Connector. For more information on the environment user requirements, see the Requirements topics for specific data platforms.
Host address	The IP address of the environment host.
SSH Port	The SSH port number used for the environment.
Login Type	Select from: <ul style="list-style-type: none"> <li>• Username and Password</li> <li>• Username and Public Key</li> <li>• Password Vault</li> </ul>
Toolkit Path	The plugin path for the environment. Delphix uses the Toolkit path (Toolkit is a synonym for Plugin) for logs, mount points, and keeping lib files.
Notes	Any other information you want to add about the environment.

### Oracle environment attributes

Attribute	Description
Environment Name (RAC)	The Environment Name field under Attributes is used to provide the name of the environment host in the case of cluster environments. This field defaults to the IP address of the host unless you specify another name.

Attribute	Description
Cluster Name (RAC)	The name of the RAC cluster as retrieved during auto-discovery from the Oracle Clusterware Repository (OCR).
Cluster Home (RAC)	This is the full pathname of the directory in which the cluster or grid ORACLE_HOME resides, which contains the executables for the Oracle Clusterware. Besides containing the software for the Oracle CRS (Cluster Ready Services), this directory also contains the binaries for Oracle ASM (Automatic Storage Management).
Version	The version of the RAC cluster as retrieved during auto-discovery from the Oracle Clusterware Repository (OCR).
Cluster User (RAC)	The OS user account with read-execute permission to access the ORACLE_HOME for the cluster/grid, as well as the ORACLE_HOME for the database.
Host Address (RAC)	Public IP hostname or IP address for the specific node (or host) within the RAC cluster.
NFS Address	In the event that the network link to which “public hostname” of the RAC nodes reside is to be used only for command-and-control traffic (i.e. SSH, JDBC, etc), and not for network-attached storage, then this field is where the comma-separated list of IP addresses for the alternate network dedicated to NFS for network-attached storage.
Virtual IP (RAC)	Oracle RAC requires setting up virtual IPs to manage failover. This field informs Delphix which IP addresses to use when a failure is detected. Click the + to add another virtual IP domain and IP address. For more details view <a href="#">Overview of Virtual IP Addresses</a>
Listeners	The listener is used to connect incoming client requests to the database. See <a href="#">Adding a Listener to an Oracle Environment</a> for more information.

Attribute	Description
Remote Listener	An Oracle TNS name resolves to an address or address list of Oracle Net remote listeners. This is the Oracle initialization parameter REMOTE_LISTENER, which must be the same on all RAC cluster instances. Click the + to add a remote listener.
SCAN	Single Client Access Name is used to allow clients to access cluster databases.
SCAN Listener	Listener used with SCAN to establish client connections to the database instances in the RAC cluster.

## Adding an Oracle single instance or RAC environment

This topic describes how to add a new Oracle or Oracle RAC environment.

### Prerequisites

- See the topics [Requirements for Oracle Hosts and Databases](#)
- There can be one Oracle unique database name (DB\_UNIQUE\_NAME) per Delphix Engine. For example, if you provision a VDB with a database unique name "ABC" and later try to add an environment that has a source database that also has a database unique name of "ABC", errors will occur.

### Procedure

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Actions (...)** menu next to **Environments** and select **Add environment**.
5. In the **Host and Server** tab, select **Unix/Linux**.
6. Select **Standalone host** or **Oracle cluster**, depending on the type of environment you are adding.
7. Click **Next**.
8. For standalone Oracle environments: Enter the **Environment name** Enter **Host IP address**
9. For cluster Oracle RAC environments: Enter the **Environment name** Enter **Cluster home** Enter **Node address**
10. For NFS Addresses (Optional): Enter one or more comma-separated **IP Address/Hostname**  
In the case of the Oracle RAC environment, ensure that the NFS Address list includes IP Addresses from all the cluster nodes. NFS address given at the time of environment creation is applied to all the discovered RAC nodes. If some nodes in the cluster need a different IP Address list, users can edit the specific host and update the NFS Address after the environment has been created.  
Note : If specified, Delphix Engine only allows NFS requests (mount, etc) originated from IP Addresses specified for the host.
11. If server authentication for remote host communication or engine to host throughput tests is desired, make sure the appropriate config is set. For more details refer to [Configuring Network Security Settings](#). You will need to create a JKS or PKCS#12 keystore on the remote host with the full CA chain of the DSP key in the keystore. By default, the key will just the signed by the Delphix CA, but you can replace the DSP key if you wish. Refer to [KeyStore Settings](#) for more details.
12. If client authentication for remote host communication or engine to host throughput tests is also desired, make sure the appropriate config is set. For more details refer to [Configuring Network Security Settings](#) You will need to create another JKS or PKCS#12 keystore on the remote host with the desired key pair. Make sure the created keystore has permissions such that it is readable by all environment users. Then, add the full CA chain of the remote host's key pair to the TrustStore on the engine. For more details, refer to [TrustStore Settings](#)
13. Enter the SSH port. The default value is 22.
14. Select a Login Type:
  - a. Username and Password - enter the OS username and password, or
  - b. Username and Public Key - enter the OS username, or
  - c. Password Vault - select from an existing Enterprise Password Vault

**Info : Using Public Key Authentication**  
If you want to use public-key authentication for logging into your Unix-based environment, there are two options: use the engine's key pair or provide a key pair for this environment.  
To use the engine's key pair:

  - i. Select **Public key** for the **Login type**.
  - ii. Click **View public key**.

- iii. Copy the public key that is displayed, and append it to the end of your `~/.ssh/authorized_keys` file. If this file does not exist, you will need to create it.
  1. Run `chmod 600 ~/.ssh/authorized_keys` to allow only the file's owner to read and write to it (make sure the file is owned by the user).
  2. Run `chmod 755 ~` to restrict access to the user's home directory so no other user may write to it.
  3. Run `chmod 700 ~/.ssh` so that others cannot write to it. The `~/.ssh` directory cannot be writable by group or other users. Otherwise, authentication will fail.

As an alternative, you can provide a key pair specific for this environment via the API or CLI. See [Option 2 in this CLI Cookbook article](#) for instructions.

15. For **Password login**, click **Verify credentials** to test the username and password.
16. Enter **Toolkit path**. The toolkit directory stores scripts used for Delphix Engine operations, and should have a persistent working directory rather than a temporary one. The toolkit directory will have a separate subdirectory for each database instance and must have 0770 permissions. At least 1.6 GB of storage is needed at the time of setting up the environment and at least 500MB of free space is required to allow refreshes and maintenance of the toolkit, especially during upgrades.
17. To provide your own Oracle Java select the **Provide my own JDK** checkbox and click **Next**.
18. In the Java Development Kit, tab enter the absolute path to your Oracle JDK and click **Next**. For more information, see [OpenJDK on Delphix Engine](#). Adding an Oracle single instance or RAC environment Procedure
19. Click **Submit**.

#### Post-requisites

After you create the environment, you can view information about it:

1. Click **Manage**.
2. Select **Environments**.
3. Select the environment name.

## Adding Oracle standalone and RAC targets in Kerberos

This topic describes how to add an Oracle standalone and RAC targets in Kerberos.

### Prerequisites

- Configure Kerberos credentials through the System Setup interface.
- Kerberized Oracle host operations are only supported in Delphix Engine release 5.2.3.0 and later.
- You must define only one principle in the Kerberos configuration and this principle must be used for all Kerberized host environments.

### Procedure

When adding a new environment or editing the configuration of an existing environment, it is a general Kerberos authentication requirement that you configure the host address using a fully qualified domain name (FQDN). The login type of Kerberos authentication is available after you apply the Kerberos configuration in the System Setup interface.

In the example below, the Kerberos principal `krbuser` has previously been configured using System Setup, so this is automatically populated when the radio button is selected.

Perform the following steps to add an Oracle standalone and RAC targets in Kerberos.

1. Login to the Delphix Management application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Actions (...)** menu next to **Environments** and select **Add environment**.
5. In the **Host and server** tab, select **Unix/Linux** and click **Next**.
6. In the **Environment settings** tab, do the following:
  - a. Enter an environment name and the host address.
  - b. Under **Login Type**, select the **Kerberos authentication** radio button.

 The Kerberos principal `krbuser` has previously been configured using the System Setup interface, so this is automatically populated when the **Kerberos authentication** radio button is selected.

c. Click Next.

d. The **Summary** tab enables you to review your configurations. Review the configuration and click **Submit**.

### Configuring Oracle RAC using the GUI

As the discovery logic attempts to add other nodes via IP address (based on cluster interrogation results which return the additional node IP addresses), automatic discovery of additional nodes will initially fail, causing Kerberos authentication to fail with "Could not log into <IP\_address> with the provided username and password". It is therefore also expected to see one or more failed actions under the Discovery job indicating "Add discovered cluster node" and "Add Oracle cluster node <node name>" were unsuccessful.

Add discovered cluster node... 

Add Oracle cluster node "b... 

 **Critical**

Could not log into  
"172.16.106.225" with the provided  
username and password.

[Details](#)

Delete Oracle cluster nod... 

As such, all nodes beyond the first must be added manually. The cluster can be added initially using the GUI or CLI as desired to discover the first node, configured via FQDN. Each additional node is added manually via CLI or GUI.

To add all the additional nodes via GUI, perform the following steps:

1. Login to the Delphix Management application.
2. Click **Manage**.
3. Select **Environments**.
4. Select the cluster node to view the basic information of the respective node.
5. In the **Cluster node** widget, click the plus icon to add a node. In this example, **bbrac31** was discovered normally, and **bbrac32.d.delphix.com** was manually added after the Environment Discovery process was completed.

## Cluster Nodes

6. Click the new node in the Cluster Nodes list.
7. Click the plus icon next to the **Virtual IPs** and add the virtual IP name and address for the node.
8. Click the plus icon next to the **Listeners** and add the name and protocol address of a listener on the node. Protocol address should be in the following format. This example uses bbrac15-vip.delphix.com as the host virtual IP address.

```
(ADDRESS=(PROTOCOL=tcp)(HOST=bbrac15-vip.delphix.com)(PORT=1521))
```

### Adding an Oracle RAC cluster using the CLI

You can use the CLI to create the cluster, specifying one of the nodes for discovery. Make sure to set the credential type to KerberosCredential. This procedure uses the following node names bbrac14, bbrac15, and bbrac16 for example purposes. "bbrac14" will be the primary node used for discovery. Make sure that you use an FQDN for the host address (it is a must Kerberos requirement for authentication):

```
delphix.engine> /environment create
delphix.engine environment create *> set type=OracleClusterCreateParameters
delphix.engine environment create *> set cluster.name=bbrac1416
delphix.engine environment create *> set cluster.crsClusterHome=/u01/app/11.2.0/grid
delphix.engine environment create *> set
primaryUser.credential.type=KerberosCredential
delphix.engine environment create *> edit nodes
delphix.engine environment create nodes *> add
delphix.engine environment create nodes 0 *> set name=bbrac14.delphix.com
delphix.engine environment create nodes 0 *> set
hostParameters.host.address=bbrac14.delphix.com
delphix.engine environment create nodes 0 *> set hostParameters.host.toolkitPath=/
work
delphix.engine environment create nodes 0 *> commit
```

Now, use the above procedure described in the **Configuring Oracle RAC using the GUI** section to manually add the node.

## Adding a database installation home to an Oracle environment

When you add an environment with the Delphix Admin application, all database installation homes on it are automatically discovered. However, if a database installation home is not automatically discovered, you can add it manually to the environment.

### Procedure

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select an Environment.
5. Click the **Databases** tab.
6. Click the **Add dataset home** button.
7. Enter the **Installation home**.
8. Enter the **Version** of the Installation Home.
9. Enter the **Oracle base** of the Installation Home.
10. Enter the **Bits** of the Oracle Home.
11. When finished, click **Add**.

### Troubleshooting

If the environment user has oinstall permissions, Delphix will be able to discover the **Version**, **Oracle Base**, and **Bits**. If any of these fields are found to be different than those provided by the user, a fault will be raised on the repository.

#### Oracle version

The version can be found in the comps.xml file in \$ORACLE\_HOME/inventory/ContentsXML/comps.xml. Example of Oracle Home with version 12.1.0.2:

```
<COMP NAME="oracle.server" VER="12.1.0.2.0" BUILD_NUMBER="0" REP_VER="0.0.0.0"
  RELEASE="Production" INV_LOC="Components/oracle.server/12.1.0.2.0/1/" LANGS="en"
  XML_INV_LOC="Components21/oracle.server/12.1.0.2.0/" ACT_INST_VER="12.1.0.2.0"
  DEINST_VER="11.2.0.0.0" INSTALL_TIME="2016.Apr.14 12:42:09 PDT" INST_LOC="/u01/app/
  oracle/product/12.1.0/dbhome_1/oracle.server">
```

#### Oracle base

This can be found as a property in \$ORACLE\_HOME/inventory/ContentsXML/oraclehomeproperties.xml. Example of Oracle Home with Oracle Base "/u03/app/ora11202":

```
<PROPERTY NAME="ORACLE_BASE" VAL="/u03/app/ora11202"/>
```

#### Bits

This can be found by running

```
file $ORACLE_HOME/bin/rman
```

The output will indicate if the Oracle Home is 32 bit or 64 bit.

## Adding a database to an Oracle environment

### Prerequisites

- Make sure your source database meets the requirements described in [Requirements for Oracle Hosts and Databases](#)
- Before adding a database, the installation home of the database must exist in the environment. If the installation home does not exist in the environment, follow the steps in [Adding a Database Installation Home to an Oracle Environment](#)

### Procedure

1. Log in to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Select an Environment.
5. Click the **Databases** tab.
6. Choose the installation home where the database is installed.
7. Click the **Plus** icon.

The screenshot shows a web interface for managing databases. At the top, there is a section titled "DATABASES" with a plus icon in a blue box to its right. Below this, there is a list of databases. The first entry is "CDOMLOSRB5A3 (CDB: CDOMLOSRB5A3)" with a small icon to its left and a pencil icon to its right. Below the database list, there is a section for "TDE Keystore Password" which is currently "Unset" with a pencil icon to its right. At the bottom, there is a section for "Connection Strings" with a plus icon to its right. Below this, there is a text area containing a connection string: "jdbc:oracle:thin:@(DESCRIPTION=(ENABLE=broken)(ADDRESS=(PROTOCOL=tcp)(HOST=10.110.222.165)(PORT=1521))(CONNECT\_DATA=(UR=A)(SID=CDOMLOSRB5A3))) (discovered) ✓".

8. In the Add Database dialog enter the **Database Path** and **Port**.

9. 

The screenshot shows a dialog box titled "Add Database" with a close button (X) in the top right corner. The dialog contains three input fields: "Database Unique Name", "Database Name", and "Instance Name". At the bottom right of the dialog, there are two buttons: "Cancel" and "Add".

When finished, click **Add**.

## Adding a listener to an Oracle environment

This topic describes how to add listeners for an Oracle environment.

When you add an environment with the Delphix Management application, all listeners that are running on it are automatically discovered. However, if a listener is not automatically discovered, you can add it manually to the environment.

### Procedure

1. Log into the **Delphix management** application.
2. Select **Manage > Environments**.
3. Click on the name of an environment to view its basic information.
4. In the Details tab next to Listeners, click the **Pencil** icon to edit the list of listeners.

#### Listeners

---

##### Name

LISTENER

##### Protocol addresses

(ADDRESS=(PROTOCOL=tcp)(HOST=10.43.8.93)(PORT=1521))

(ADDRESS=(PROTOCOL=ipc)(KEY=EXTPROC1521))

---

5. In the Listeners panel click the **Plus** icon.

**Listeners** +

---

**Name**

**Protocol addresses** +

---

**Name**

**Protocol addresses** +

---

**Name**  
 LISTENER

**Protocol addresses**  
 (ADDRESS=(PROTOCOL=tcp)(HOST=10.43.8.93)(PORT=1521))  
 (ADDRESS=(PROTOCOL=ipc)(KEY=EXTPROC1521))

6. Enter a **Name** for the new listener, and a **Protocol address** of the listener. The Delphix Engine currently supports TCP and IPC protocol addresses. An example TCP protocol address is (ADDRESS=(PROTOCOL=TCP)(HOST=10.43.17.92)(PORT=1521)) and an example IPC protocol address is (ADDRESS=(PROTOCOL=IPC)(KEY=DELPHIX))
7. Click the **Plus** icon next to **Protocol addresses** to enter additional protocol addresses.
8. Click the **Check** icon to save your changes.

## Enabling linking and provisioning for Oracle databases

This topic describes how to enable and disable provisioning, and linking for databases on an environment.

Before you can use a database as a dSource, you must first make sure that you have defined an environment and that linking is allowed on it in the Delphix Environment. Similarly, before you can provision a virtual database (VDB) to a target database, you must make sure that you have allowed provisioning to the host or cluster to which the Delphix Environment is attached.

### Procedure

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click **Databases**.
  - a. **For provisioning:** On the installation, you wish to work on select Edit for the **Installation details** and toggle the **Allow provisioning** checkbox and click save.
  - b. **For linking:** Under in the database section of the installation which contains the DB you wish to link click edit for **Allow linking** and toggle the checkbox then click save.

## Linking an Oracle RAC source database using a standalone host environment

The standard way to link an Oracle RAC database as a dSource in the Delphix workflow is to provide the name or IP of one of the cluster nodes and then discovery will find the other cluster members, listeners, and databases. This is done by adding an 'Oracle Cluster' type Environment in the Add Environment wizard. The cluster nodes will be added to the Environment using the hostname/IP returned by the `'olsnodes'` command and in most cases, this will be sufficient. There may, however, be cases when this is undesirable, such as wanting to run snapsync/logsync traffic over a second network. Using an 'Oracle Cluster' type Environment currently stores a single IP for each cluster node and this IP will be the one associated with the node name returned by the `'olsnodes'` command. Using a Standalone Environment is one way to work around this situation by defining the Environment based on the IP on the network snapsync/logsync should run over. The Delphix Engine should have a NIC connected to this network also. When both Delphix Engine and source servers have NICs on this second network there is no need for static routes to be configured on the Delphix Engine or the source server.

1. Ensure that OS and DB users for Delphix have been configured and [meet requirements](#). Create the OS user on each node using the exact same settings. Always use the hostchecker to verify the source and target environments are ready for use with Delphix.  
Even though a single node will be used for linking, it may be desirable to unlink and relink the source to a different node in the future, so make sure the Delphix OS account is configured identically on all nodes.
2. Create a toolkit directory in the same location on each node and ensure permissions are set to 0770.
3. Identify the local IP address on the second network of the node which will be used for linking. Use the `'oifcfg'` and `'ifconfig'` commands to find this information. Then verify by pinging the Delphix Engine using it's IP on the second network. Don't worry about the output from `'oifcfg'` with respect to `PUBLIC, PRIVATE` or `UNKNOWN` values for the interfaces. These are not actual CRS usage, but rather based on the IP address range (RFC1918) - in the image they all show as `PRIVATE`.

```

[alex:syrinx_3:]/home/oracle => $CRS_HOME/bin/oifcfg iflist -p -n
eth0 10.0.0.0 PRIVATE 255.255.0.0
eth1 192.168.1.0 PRIVATE 255.255.255.0

rtt min/avg/max/mdev = 0.251/0.385/0.534/0.108 ms
[alex:syrinx_3:]/home/oracle => _

```

4. Add a 'Standalone Host' type environment using the chosen cluster node's second network IP.
5. When discovery is finished, the Oracle homes on the cluster node should be discovered along with the listeners that run on that node. Once that is done add the database that will eventually be a dSource to by providing the db\_unique\_name, db\_name, and the instance name that runs on the node that was added.
6. Then add a jdbc connect string using the node VIP and a service name.
7. Now click on the add dSource link. Follow the steps in [Adding a dSource](#) making sure to set the Snapshot controlfile location in RMAN to a location that's visible to all cluster nodes, or snapsync will fail. An ASM diskgroup is a suitable location. Even if the Snapshot controlfile is not located in a shared location, it is still possible to link the source - the first snapsync will fail with a fault that relates to the Snapshot controlfile location, but subsequent Snapsync operations should succeed.  
JDBC connections will go over the public network and snapsync / logsync / environment monitor traffic will go over the second network.

## Listener and JDBC verification

As with any database, a VDB needs to have a listener in order for external connections to be made. The Delphix Engine also uses a JDBC connection string in order to connect to a source or target database. If the engine does not have the proper listener or JDBC connect string defined, then connection errors can result.

### Verifying the listener configuration

1. Verify that a listener is running on the source or target environment that you are investigating.
2. Login to the Delphix Management application.
3. Click **Manage**.
4. Select **Environments**.
5. Click on the **environment in** which you are troubleshooting.
6. On the **Configuration** tab, locate the **Listeners** section. Verify that the listener for the source or target system is listed there.
7. If a listener is not listed, it may be due to insufficient privileges on the part of the environment user that the engine is using. Verify that the proper sudo permissions have been granted for the user, or adjust them as necessary.

8. If you need to add another listener, you can do so manually.
  - a. Click the plus (+) sign.
  - b. Enter the appropriate values using the above image as a reference.

### Verifying the JDBC connection string

Each source database and VDB has a connection string defined. If any parameters have changed, you may need to adjust these connection strings.

1. Verify that a listener is running on the source or target environment you are investigating.
2. Login to the Delphix Management application.
3. Click **Manage**.
4. Select **Environments**.
5. Click the environment in which you are troubleshooting.
6. Select the **Databases** tab.
7. The source database or VDB which you are investigating will display the JDBC connection string being used for the given database.
8. To verify that the connection string works, click the **checkmark** to the right of the connection string. You will then see the username and password text boxes.
9. Enter the Oracle username and password used by the Delphix Engine.

## Verify Connection String

### JDBC Connection String

```
jdbc:oracle:thin:@(DESCRIPTION=(ENABLE=broken)(ADDRESS=(PROTOCOL=tcp)
(HOST=10.110.222.165)(PORT=1521))(CONNECT_DATA=(UR=A)
(SID=CDOMLOSRB5A3)))
```

### Database Username

### Database Password

If no errors are encountered and the username/password dialogs simply go away, then a successful connection was made to the database.

If errors are encountered, you must investigate them on a case-by-case basis, just as you would do with any connection errors to an Oracle database.

## Adding JDBC connection string

If you need to define an additional JDBC connection string for any reason, take the following steps:

1. Follow the same steps as listed in [Verifying the JDBC Connection String](#) to reach the JDBC connection string definition(s).
2. Click the plus (+) sign to the right of **Connection strings** to define an additional connection string.   
*Add Connection String Icon*  
In the screenshot below, the user is adding a connection string for the “test2” service on port 1530 instead of the default 1521.
3. Click the **Add** to save the changes.
4. Follow the remaining steps in [Verifying the JDBC Connection String](#) to validate your newly added connection string.

## Verifying the JDBC connection string

Each source database and VDB has a connection string defined. If any parameters have changed, you may need to adjust these connection strings.

1. Verify that a listener is running on the source or target environment you are investigating.
2. Login to the Delphix Management application.
3. Click **Manage**.
4. Select **Environments**.
5. Click the environment in which you are troubleshooting.
6. Select the **Databases** tab.
7. The source database or VDB which you are investigating will display the JDBC connection string being used for the given database.
8. To verify that the connection string works, click the **checkmark** to the right of the connection string. You will then see the username and password text boxes.
9. Enter the Oracle **username** and **password** used by the Delphix Engine.

### Verify Connection String ✕

---

**JDBC Connection String**  
jdbc:oracle:thin:@(DESCRIPTION=(ENABLE=broken)(ADDRESS=(PROTOCOL=tcp)  
(HOST=10.110.222.165)(PORT=1521))(CONNECT\_DATA=(UR=A)  
(SID=CDOMLOSRB5A3)))

**Database Username**

**Database Password**

---

Cancel
Verify

#### *Database Username and Password*

If no errors are encountered and the username/password dialogs simply go away, then a successful connection was made to the database.

If errors are encountered, you must investigate them on a case-by-case basis, just as you would do with any connection errors to an Oracle database.

### Verifying the listener configuration

1. Verify that a listener is running on the source or target environment that you are investigating.
2. Login to the Delphix Management application.
3. Click **Manage**.
4. Select **Environments**.
5. Click on the **environment in** which you are troubleshooting.
6. On the **Configuration** tab, locate the **Listeners** section. Verify that the listener for the source or target system is listed there.
7. If a listener is not listed, it may be due to insufficient privileges on the part of the environment user that the engine is using. Verify that the proper sudo permissions have been granted for the user, or adjust them as necessary.
8. If you need to add another listener, you can do so manually.
  - a. Click the plus (+) sign.
  - b. Enter the appropriate values using the above image as a reference.

## Providing your own Oracle Java

Delphix supports the ability for users to provide their own Oracle JDK for each host. This feature is intended for customers who have a Java license with Oracle and want to use a more recent version than the one that comes with Delphix. Note that the JDK is provided per node or host, not per cluster or environment. Initially, when creating a cluster all hosts must have Java at the same absolute path. However, once the cluster has been discovered in Delphix each host's path can be adjusted.

For details about which versions of Oracle Java are supported see the Java Support Policy section below.

**⚠** All Delphix environment users on the host require read and execute permissions on the provided JDK, its subfolders, and files.

### Adding an Oracle JDK

By default, Delphix comes with the OpenJDK. To modify the JDK, follow the below steps:

1. log in to the **Delphix management** application.
2. Click **Manage**.
3. Select **Environments**.
4. Click the **Actions (...)** menu next to **Environments** and select **Add environment**.
5. In the **Environment settings** tab, select the **Provide my own JDK** checkbox, and click **Next**.  
This action will remove the previous built-in JDK and will initiate an Environment refresh operation after the path is changed.

**Warning:** Select the Reset to Default to reset your JDK to the OpenSource JDK (default).

6. In the **Java development kit** tab, the currently selected JDK kit will be shown (default is OpenJDK). Provide an absolute path to the JDK root and click **Next**.
7. Verify the configured JDK and environment settings and click **Submit**.

### Updating a JDK path

For existing environments users can add or update JDK paths by following the steps below:

1. Log in to the **Delphix management** application.
2. Select **Manage > Environments**.
3. Click on the name of an environment to view its basic information.
4. In the Details tab next to the **Java development kit**, click the **Pencil** icon.
5. In the **Java development kit dialog**, provide an absolute path to the JDK root and click **Next**.

 1. Do not place the JDK inside the Delphix Toolkit.

6. Click the **Check** icon to save your changes.

### Java support policy

For each release of the Delphix engine, we will support Java version(s) depending on the available Java builds provided by Oracle in that time period. The following statements apply for Java support for specific Delphix versions:

1. In accordance with our security policy, every six months, we will certify the latest update release of the currently supported LTS Oracle Java.
2. We will support at least one commercially supported LTS release per Delphix version for 1 year, at which point we will update the minimum supported version.
3. Introducing support for new LTS versions of Java will be considered and evaluated with each major version of Delphix.
4. At least 1 year before Oracle ends support for an LTS version of Java, Delphix will also end support for that version and update it to a newer LTS version.

### Supported operating systems

This feature is supported with use for Linux, Solaris, and Windows environments, as described in the support matrix. We do not support Bring Your Own Oracle Java with AIX and HP-UX because those vendors provide us with a specific Java version to run on those hosts.

Only Java versions equal to or greater than U242 and equal to or lesser than U281 are tested and certified by Delphix.

	<b>RHEL</b>	<b>SLES</b>	<b>Solaris</b>	<b>AIX</b>	<b>HP-UX</b>	<b>Windows</b>
<b>Oracle Java 8 u242</b>	Supported	Supported	Supported	N/A	N/A	Supported
<b>Oracle Java 8 u281</b>	Supported	Supported	Supported	N/A	N/A	Supported
<b>Oracle Java 8 u333</b>	Supported	Supported	Supported	N/A	N/A	Supported

	<b>RHEL</b>	<b>SLES</b>	<b>Solaris</b>	<b>AIX</b>	<b>HP-UX</b>	<b>Windows</b>

## Changing the hostname or IP address for Oracle source and target environments

### Procedure

#### For source environments

1. Disable the dSource as described in [Enabling and Disabling Oracle dSources](#)
2. If the **Host Address** field contains an IP address, edit the IP address.
3. If the **Host Address** field contains a hostname, update your Domain Name Server to associate the new IP address to the hostname. The Delphix Engine will automatically detect the change within a few minutes.
4. In the **Environments** screen of the Delphix Engine, refresh the host.
5. Enable the dSource.

#### For VDB target environments

1. Disable the VDB as described in [Enabling and Disabling Oracle VDBs](#)
2. If the **Host address** field contains an IP address, edit the IP address.
3. If the **Host address** field contains a hostname, update your Domain Name Server to associate the new IP address to the hostname. The Delphix Engine will automatically detect the change within a few minutes.
4. In the **Environments** screen of the Delphix Engine, refresh the host.
5. Enable the VDB.

#### For the Delphix engine

1. To stop running your VDB select the red **Stop** button located on the VDB **Configuration** tab.
2. Disable all dSources as described in [Enabling and Disabling Oracle dSources](#)
3. You can use either the command-line interface or the Delphix Setup application to change the IP address of the Delphix Engine.
  - a. To use the command-line interface, press **F2** and follow the instructions described in [Setting Up Network Access to the Delphix Engine](#)
  - b. To use the Delphix Setup application, go to **Delphix management > Engine setup** in the Delphix Management application, or click **Server setup** in the Delphix Engine login screen.
    - i. In the **Network** panel, click **Modify**.
    - ii. Under **DNS services**, enter the new IP address.
    - iii. Click **OK**.
4. Refresh all Environments by clicking the **Refresh** symbol on the **Environments** screen.
5. Enable all dSources as described in [Enabling and Disabling Oracle dSources](#)
6. To start all VDBs, click the **Start** button located on the VDB **Configuration** tab.

#### Using custom init.ora or spfile.ora files

If you are using custom `init.ora` or `spfile.ora` files with your Oracle VDBs, you should use the Oracle command-line interface ( `sqlplus/srvctl` ) to shut down any active VDBs and copy the parameter files to a backup location. Complete the steps above, then replace the files and re-start the VDB from the Oracle command line to restore your custom settings. See [Customizing VDB File Mappings](#) for more information about customizing `init.or` and other configuration files.

## How to change ORACLE\_HOME

### Prerequisites

- know the new ORACLE\_HOME user and password
- know the VDB you want to change
- have delphix\_admin privileges to the VDB

### Procedure

1. Login to the **Delphix management** application.
2. Click **Manage**.
3. Select **Datasets**.
4. Select your VDB.
5. Select the **Configuration tab**.
6. In the upper right-hand corner of the **Source** sub-tab, click the **Actions menu (...)** and select **Upgrade**.
7. Select the new **Installation** from the drop-down menu.

## Upgrade Database

✕

8. Click **Upgrade**.

## CLI support for partial-full backup in Oracle

### Overview

Delphix Engine version 6.0.8.0 introduces an option to perform partial full snapsync via the CLI. A full backup of specified datafiles will be performed, along with an incremental backup of the remaining files.

### Prerequisites

1. Requested datafiles must exist in the database for which SnapSync is being run.
2. In case of an MT, Snapsync must be performance for the PDB, the datafiles can belong to either the PDB or its CDB.
3. Requested datafiles must be online.
4. Partial full SnapSync can not be requested for an initial SnapSync.
5. Partial full SnapSync can not be run if there is a pending SnapSync.

### Command

```
ip-00-000-000-000 database> select CDOMLOSR1CEBPDB3
ip-00-000-000-000 database 'CDOMLOSR1CEBPDB3'> sync
ip-00-000-000-000 database 'CDOMLOSR1CEBPDB3' sync *> set filesForFullBackup=1,2
ip-00-000-000-000 database 'CDOMLOSR1CEBPDB3' sync *> commit
```

## Linking data sources and syncing data with Oracle

Linking a data source will create a dSource object on the engine and allow Delphix to ingest data from this source. The dSource is an object that the Continuous Data Engine uses to create and update virtual copies of your database. As a virtualized representation of your source data, it cannot be managed, manipulated, or examined by database tools.

Once a dSource has been linked, you can begin to perform dSource operations on it such as enable, detach, delete, and more.

This section covers the following topics:

- [Linking data sources with Oracle](#)
- [Linking an Oracle pluggable database](#)
- [Staging push implementation for Oracle](#)
- [Data management settings for Oracle data sources](#)
- [Prepare and upgrade a non-MT Oracle dSource to MT](#)
- [Repository templates for Oracle databases](#)
- [Using the purgeLogs operation](#)
- [Advanced linking](#)

## Linking data sources with Oracle

Linking a dSource will ingest data from the source and create a dSource object on the engine. The dSource is an object that the Continuous Data Engine uses to create and update virtual copies of your database. As a virtualized representation of your source data, it cannot be managed, manipulated, or examined by database tools.

Once a dSource has been linked, you can begin to perform dSource operations on it such as enable, detach, delete, and more.

For an overview of all dSource related actions, please visit [Provisioning and Managing Virtual Databases](#)

1. Login to the **Delphix management** application.
2. Navigate to **Manage > Datasets**.
3. Click the plus icon and select **Add dSource**.
4. In the **Add dSource** wizard, select the source database with the correct environment user-specified.
5. Enter your login credentials for the source database and click **Verify credentials**. If you are linking a mounted standby, Click **Next**. See the topics under [Linking Oracle Physical Standby Databases](#) for more information about how the Delphix Engine uses non-SYS login credentials.
6. Enter a name and select a group for your dSource. Adding a dSource to a dataset group lets you set Delphix Domain user permissions for that database and its objects, such as snapshots. See the topics under [Users and Groups](#) for more information.
7. Select the **Data management** settings needed. For more information, visit [Data Management Settings for Oracle Data Sources](#)
8. Assign existing policies to the new dSource. New policies can be created and associated later.
9. Enter any scripts that should be run using the **Hooks** page.
10. Review the dSource Configuration and Data Management information, and then click **Submit**.

Once the action to add a dSource has been submitted, the Delphix Engine will initiate a DB\_Link job to create the dSource. If the *Load Immediately* option was selected in the data management page a DB\_Sync job will also be executed to ingest data from the source, otherwise, this first DB\_Sync job will run as per the associated SnapSync policy.

When the jobs have successfully completed, the database icon will change to a dSource icon on the Environments > Databases screen, and the dSource will be added to the list of Datasets under its assigned group.

## Linking an Oracle pluggable database

This topic describes how to link an Oracle 12c pluggable database to the Delphix Engine to create a dSource.

### Prerequisites

- Make sure the Delphix Engine has already discovered the multitenant container database and its pluggable databases. If the container database does not exist in the environment, follow the steps in [Adding a Database to an Oracle Environment](#). If the pluggable database you want to link does not exist in the environment.
- You should have Block Change Tracking (BCT) enabled for the container database, as described in [Requirements for Oracle Hosts and Databases](#)
- The container database should be in ARCHIVELOG mode and the NOLOGGING option should be disabled, as described in [Requirements for Oracle Hosts and Databases](#)

### Procedure

1. Log into the **Delphix management** application.
2. Select **Manage > Datasets**.
3. Click the **Plus** icon and select **Add dSource**.
4. In the **Add dSource** wizard, select the source pluggable database. If the container database is shown but the pluggable database is not, select the **container database**, enter its **database credentials**, and click **Verify credentials**. The Delphix Engine will discover and list all pluggable databases in the container database. Select the **pluggable database** from the list. Alternatively, you can use the **Environment management** screen to discover pluggable databases in any of the discovered container databases.
5. Enter your **login credentials** for the source database and click **Verify credentials**.
6. Click **Next**.
7. Select a **Database group** for the dSource.
8. Click **Next**.
9. Select an **Initial load** option. By default, the initial load takes place upon completion of the linking process. Alternatively, you can set the initial load to take place according to the SnapSync policy. For example, you can set the initial load to take place when the source database is not in use, or after a set of operations have taken place.
10. Select a **SnapSync** policy. See [Advanced Data Management Settings for Oracle dSources](#) for more information.
11. Click **Next**.
12. Review the **dSource configuration** and **Data management** information.
13. Click **Submit**. The Delphix Engine will initiate two jobs, **DB\_Link** and **DB\_Sync**, to create the dSource. You can monitor these jobs by clicking **Active Jobs** in the top menu bar, or by selecting **System > Event Viewer**. When the jobs have completed successfully, the database icon will change to a dSource icon on the **Environments > Datasets** screen, and the dSource will be added to the list of **Datasets** under its assigned group. Link/Sync of the Multitenant Container Database The **DB\_Link** job will also link the pluggable database's multitenant container database if it has not been linked yet.

## Oracle staging push-overview

### Introduction

The staging push feature allows you to ingest production data into the Delphix Engine without the need for the Delphix-initiated backups. It uses a staging database instance that can be populated with production data, by restoring your existing backups or by setting it up as a physical standby, using storage provided by the Delphix Engine. Delphix Engine then uses the database files on this storage to take dSource snapshots. Thus, eliminating the need to access the production environment. Since the restore process is not controlled by Delphix Engine, any backup vendor can be used to restore production database backups on the staging database.

### Workflow

Ingesting data from Staging Push dSources consists of the following steps:

- [Linking an Oracle Staging Push dSource](#)
- [Populating staging database with production data](#)
- [Taking a snapshot](#)

The staging database can be populated further with incremental data from the production database to take incremental snapshots.

- Disable or enable operations are allowed only at the CDB level. Disabling a CDB dSource will also disable all the PDB dSources.
- Detach or attach operations are not allowed on the staging push dSources.
- Delete operation is allowed for both CDB and PDB dSources. However, since PDBs cannot be unplugged/dropped from an Oracle database in the MOUNT state, you will be responsible for unplugging/dropping the PDB from the CDB. Deleting a CDB dSource will also delete all the PDB dSources.
- A Non Multi Tenant Staging Push dSource can not be used to ingest a multi-tenant database. For a multi-tenant database, separate Staging Push dSources should be created for CDB and individual PDBs.

### Limitations

- Logsync is currently not supported and thus Point-in-Time provisioning is not supported.
- Staging Database should be in the MOUNT mode for taking a snapshot.

## Linking an Oracle non multi tenant staging push dSource

You can perform the following steps to link a Non Multi Tenant dSource using the staging push mechanism.

1. Login to the **Delphix management** application.
2. Go to **Manage > Datasets**.
3. Click the plus (+) icon and select **Add dSource**.
4. On the **Preparation** tab, click **Next**.
5. From the **dSource type** tab, select the **Oracle staging push** as dSource type and click **Next**.
6. On the **dSource configuration** step, provide the following dSource configurations:
  - a. **dSource name** - This name will be shown on the Delphix Engine interface.
  - b. **Target group** - Select a target group from the drop-down list.
  - c. **Database type** - Select the database type as **Non Multi Tenant**.
  - d. **Staging environment** - Select an environment from the drop-down list. The staging database will be hosted in this environment.
  - e. **User** - Select an environment user from the drop-down list.
  - f. **Repository** - Select a repository (Oracle installation) from the drop-down list.
  - g. **Database name:** Provide the Database Name for the staging dSource.
 

**Info :** Consider the following while providing the database name:

    - This is the name of the staging database that is created on the staging host after linking.
    - The Database Name should be the same as the source database's database name. The source database is the database whose data will be populated on this staging database.
    - Database Name is case-sensitive.
    - You can run either of the two queries on the source database to get the database name:
      - `show parameter db_name;`
      - `select name from v$database;`
  - h. **Database unique name** - Provide a database unique name for the staging database. It can be different from the database unique name of the source database.
  - i. **SID** - Provide the SID for the staging database.
  - j. **Mount base** - Provide a mount path. This is the location on the staging host at which the Delphix Engine will mount its storage for the staging database. To know about the permissions that the mount path directory must-have, see the Additional Target/Staging Host Requirements section of [this](#) article.
  - k. **Custom environment variables** - Configure the [custom environment variables](#), similar to VDBs, if needed.
  - l. Optionally, you can configure **Auto staging push restart**, **Configure staging database parameters**, **Physical standby**, and **Validate snapshot by Opening database in read only mode**, as per requirement.
    - i. **Auto staging push restart** indicates whether this staging database should be automatically restarted when the staging host reboot is detected.
    - ii. **Configure staging database parameters** to override Oracle database configuration parameters.
    - iii. **Physical standby** indicates that the staging database will be configured as a physical standby.
 

**Info :** The staging database is not configured as a Physical Standby by Delphix Engine. The setup should be done outside Delphix Engine before initiating the Snapshot operation.
    - iv. **Validate Snapshot by Opening Database in Read Only Mode** indicates whether the staging database snapshots will be validated by opening the database in read-only mode. **Info :** All these options are disabled by default.
  - m. Click **Next**.
7. From the **Staging database parameters** tab, select a template and click **Next**.

8. From the **Policies** tab, select any policy for the new dSource. **SnapSync Policy** is used as a default policy for taking snapshots. For more information on SnapSync policy, see [Policies for Scheduled Jobs](#) Click **Next**.
9. From the **Hooks** tab, enter any script that should be run before (pre-sync) or after (post-sync) the snapshot operation.
10. From the **Summary** tab, review the staging Push dSource configuration profile and click **Submit**. When all the above steps are executed on the staging host, a new database is instantiated with the above provided Database Name, Database Unique Name, and SID, and the database files are expected to be placed at the location: `MOUNT_BASE/<Database_Unique_Name>/datafile` . Once linking is done, you can see this Staging Push dSource under the **Datasets**.

## Linking an Oracle multi tenant staging push dSource

Oracle Multi Tenant Staging Push dSource can be linked with the following steps:

1. [Link a CDB staging push dSource](#)
2. [Link a PDB staging push dSource](#)

- A CDB Staging Push dSource must be created before creating a PDB Staging Push dSource.
- A CDB dSource ingests data for the CDB and PDB\$SEED databases.
- Except for PDB\$SEED, a PDB dSource must be created for each PDB associated with the CDB.

## Linking a CDB staging push dSource

You can perform the following steps to link a CDB dSource using the staging push mechanism.

1. Login to the **Delphix management** application.
2. Go to **Manage > Datasets**.
3. Click the plus (+) icon and select **Add dSource**.
4. On the **Preparation** tab, click **Next**.
5. From the **dSource Type** tab, select the **Oracle staging push** as dSource type and click **Next**.
6. On the **dSource configuration** step, provide the following dSource configurations:
  - a. **dSource name** - This name will be shown on the Delphix Engine interface.
  - b. **Target group** - Select a target group from the drop-down list.
  - c. **Database type** - Select the database type as CDB.
  - d. **Staging environment** - Select an environment from the drop-down list. The staging database will be hosted in this environment.
  - e. **User** - Select an environment user from the drop-down list.
  - f. **Repository** - Select a repository (Oracle installation) from the drop-down list.
  - g. **CDB name:** Provide the Database Name for the staging CDB dSource.
 

**Info :** Consider the following while providing the CDB name:

    - This is the name of the staging container database that is created on the staging host after linking.
    - It should be the same as the source CDB's Database Name
    - It is case-sensitive
    - You can run either of the two queries on the source database to get the CDB database name:
      - `show parameter db_name;`
      - `select name from v$database;`
  - h. **CDB unique name:** Provide CDB unique name for the staging database. It can be different from the database unique name of the source CDB database.
  - i. **SID** - Provide the SID for the staging database.
  - j. **Mount base** - Provide a mount path. This is the location on the staging host at which the Delphix Engine will mount its storage for the staging database. To know about the permissions that the mount path directory must have, see Additional Target/Staging Host Requirements section of [this](#) article.
  - k. **Custom environment variables** - Configure the [custom environment variables](#), similar to VDBs, if needed.
  - l. Optionally, you can configure **Auto staging push restart**, **Configure staging database parameters**, **Physical standby**, and **Validate snapshot by opening Database in read only mode**, as per requirement.
    - i. **Auto Staging Push Restart** indicates whether this staging database should be automatically restarted when the staging host reboot is detected.
    - ii. **Configure Staging Database Parameters** to override Oracle database configuration parameters.
    - iii. **Physical Standby** indicates that the staging database will be configured as a physical standby.
 

**Info :** The staging database is not configured as a Physical Standby by Delphix Engine. The setup should be done outside Delphix Engine before initiating the Snapshot operation.
    - iv. **Validate Snapshot by Opening Database in Read Only Mode** indicates whether the staging database snapshot will be validated by opening the database in read-only mode.
 

**Info:** All these options are disabled by default.
  - m. Click **Next**.
7. From the **Staging Database Parameters** tab, select a template and click **Next**.

8. From the **Policies** tab, select any policy for the new dSource. **SnapSync Policy** is used as a default policy for taking snapshots. For more information on SnapSync policy, see [Policies for Scheduled Jobs](#) Click **Next**.
9. From the **Hooks** tab, enter any script that should be run before (pre-sync) or after (post-sync) the snapshot operation.
10. From the **Summary** tab, review the Staging Push dSource configuration profile and click **Submit**.

When all the above steps are executed on the staging host, a new database is instantiated with the above provided Database Name, Database Unique Name, and SID, and the database files are expected to be placed at the location:

`MOUNT_BASE/<CDB_Unique_Name>/datafile` . Once linking is done, you can see this Staging Push CDB

dSource under the **Datasets**.

## Linking a PDB staging push dSource

You can perform the following steps to link a PDB dSource using the staging push mechanism.

1. Login to the **Delphix Management** application.
2. Go to **Manage > Datasets**.
3. Click the plus (+) icon and select **Add dSource**.
4. On the **Preparation** tab, click **Next**.
5. From the **dSource Type** tab, select the **Oracle Staging Push** as dSource type and click **Next**.
6. On the **dSource Configuration** step, provide the following dSource configurations:
  - a. **dSource Name** - This name will be shown on the Delphix Engine interface.
  - b. **Target Group** - Select a target group from the drop-down list.
  - c. **Database Type** - Select the database type as PDB.
  - d. **Staging Environment** - Select an environment from the drop-down list. The staging database will be hosted in this environment.
  - e. **Repository** - Select a repository (Oracle installation) from the drop-down list.
  - f. **Container Database**: Select the Staging Push Container database to which the PDB will be plugged.
  - g. **PDB Name**: Provide the PDB name for the staging PDB dSource.
 

**Info** : Consider the following while providing the PDB name:

    - This should be the same as the source PDB's Name
    - PDB name is case-sensitive
    - You can run this query in the source database to get the PDB name: `select name from v$pdb;`
  - h. **Custom Environment Variables** - Configure the [custom environment variables](#), similar to VDBs, if needed.
  - i. Optionally, you can configure **Validate Snapshot by Opening Database in Read Only Mode**, as per requirement. This indicates whether the staging database snapshot will be validated by opening the database in read-only mode.
 

**Info** : The option is disabled by default.
  - j. Click **Next**.
7. From the **Staging Database Parameters** tab, select a template and click **Next**.
8. From the **Policies** tab, select any policy for the new dSource. **SnapSync Policy** is used as a default policy for taking snapshots. For more information on SnapSync policy, see [Policies for Scheduled Jobs](#) Click **Next**.
9. From the **Hooks** tab, enter any script that should be run before (pre-sync) or after (post-sync) the snapshot operation.
10. From the **Summary** tab, review the Staging Push dSource configuration profile and click **Submit**. Upon submission, a new pluggable database will be created and plugged into the given Container Database on the staging host. The data files for this pluggable database are expected to be placed at the location: `MOUNT_BASE/<PDB_Name>-<CDB_Unique_Name>/datafile` . Once linking is done, you can see this Staging Push PDB dSource under the **Datasets**.

## Populating staging database with production data

You can update the staging database with the latest data from the source database by either restoring source database backups over it or, by setting it up as a physical standby.

### Pre-requisites

**i** While populating the data on the staging database, make sure that all the data files go to the below Delphix Engine mounted location:

For Non Multi Tenant Databases:

- *MOUNT\_BASE/<Database\_Unique\_Name>/datafile*

For Multi Tenant Databases:

- For CDB and PDB\$SEED: *MOUNT\_BASE/<CDB\_Unique\_Name>/datafile*
- For PDB: *MOUNT\_BASE/<PDB\_Name>-<CDB\_Unique\_Name>/datafile*

### Restoring and recovering the source database

- For Non Multi Tenant database, after linking the dSource, restore your existing source database backups onto the mount location.
- For Multi Tenant databases, after linking the CDB and PDB dSources:
  - Restore CDB and PDB\$SEED backups to the CDB mount location.
  - Restore PDB backup to the PDB mount location.

### Automating the data population

You can automate the data population process on the staging database in the following ways:

- Create automation scripts and schedule/execute them outside of Delphix Engine.
- Configure pre/post-sync hooks to restore a backup or start/stop managed recovery process.

## Taking Oracle staging push dSource snapshots

### Taking a Snapshot

On initiating a [sync](#), Delphix Engine checks the staging server for the database of the given name and if a match is found, it then takes a snapshot of its data files. Before and after taking the snapshot, Delphix Engine runs a few validations to check the readiness and consistency of the database for the snapshot.

Below are the checks performed by Delphix Engine during snapshot operation:

- The staging database is in the `MOUNT` mode
- All data files are present on the Delphix Engine mounted storage
- Checkpoint SCN of all online datafiles is the same
- The database should be recovered and no data files should be in `FUZZY` state
- Managed recovery is not running for the staging database
- Checkpoint SCN must advance since the last snapshot was taken
- Checkpoint SCN has not advanced during the snapshot operation

 CDB dSource snapshots cannot be taken manually. A PDB dSource snapshot operation takes a CDB dSource snapshot first before taking a PDB snapshot.

### Taking an incremental snapshot

The staging database can be populated further by:

- Restoring incremental backups
- Through ongoing managed recovery in case of Physical Standby databases

After the staging database is populated with incremental changes, a snapshot operation will take an incremental snapshot of the dSource.

### Migrating to another repository

The staging push database can be moved to another repository in the same or a different environment using the following steps:

1. Disable the staging push dSource.
2. Under **Datasets**, go to dSource **Configuration** tab.
3. Click on the pencil icon next to **Staging Environment** to get into edit mode.
4. Update the Environment **Name** (if migrating to another environment), **Repository** and **User**.

**STAGING ENVIRONMENT**

**Name**

stage-env-1

**OS**

Linux (RedHat)

**Timezone**

America/New\_York,EST-0500

**Repository**

/u01/app/oracle/product/19.7.0.0/dbhome\_1

**User**

oracle

✕ 

5. Enable the dSource.

## Data management settings for Oracle data sources

Each dSource has its own data management settings, which can be configured during the linking workflow as well as in the configuration page for that dSource.

You can configure data management settings to improve overall performance and match the needs of your specific server and data environment.

The following settings are available for Oracle data sources:

Setting	Explanation
Initial Load	By default, the initial load takes place upon completion of the dSource linking wizard.  Alternatively, you can set the initial load to take place according to a SnapSync policy. This might be desirable if you want the initial load to take place when the source database is under a lower load.
External Data Directory	An optional directory on the database server containing extra files associated with the database that are not included in normal SnapSync snapshots, for example, external table data files. Nothing in this directory will be modified, but the files will be loaded and provisioned along with the database.
Compression	Enable compression of backup data sent over the network. Compression is enabled by default.
Bandwidth Limit	Select the network bandwidth limit in units of MB/s between the source and the Delphix Engine. The default is 0, indicating that no bandwidth limit is enforced.
Number of Connections	Select the number of TCP connections to use between the Source and the Delphix engine. Multiple connections may improve network throughput especially over long distances and highly congested networks. The default is 1.
Encrypted Linking	Turn on encryption between the source and the Delphix Engine. Enabling encrypted linking leads to higher CPU utilization and higher throughput. Encrypted Linking is disabled by default.

Setting	Explanation
Data Load Channels	<p>The channel settings determine the number of channels and data files per backup set. While these settings can be increased, you should consider potential adverse effects on the performance of database operations on the Source server</p> <ul style="list-style-type: none"> <li>• Number of Channels - set the number of RMAN channels used during SnapSync. The default is 2.</li> <li>• Files per Channel - maximum number of data files in a backup set. The default is 5.</li> </ul> <p>The product of files-per-channel and number of channels determines the maximum number of data files concurrently backed up by RMAN.</p>
Block Checking	<p>Enable logical block validation by RMAN. Checking is CPU intensive and will slow down SnapSync. Enabling block checking will detect logical inconsistencies while syncing with the source.</p> <p>Block checking is disabled by default.</p>
Level Backup	<p>Level backups should only be used to workaround Oracle bug 10146187 on physical standby sources. Switching from SCN to LEVEL mode will force a Level 0 backup.</p> <p>See <a href="#">Linking Oracle Physical Standby Databases</a> for more information. Level Backups are disabled by default.</p>
Skip Available Space Check	<p>Skips checks for available space during the initial load in the Delphix Engine. The initial load will fail if the database needs more space than what is available in the Delphix Engine.</p> <p>This setting is only recommended after consulting with Delphix Support</p>
Double SnapSync	<p>Double SnapSync, or DoubleSync, takes two snapshots sequentially in order to improve the performance of subsequent operations, such as VDB provisioning and refresh.</p> <p>Performs the initial load without retrieving any archived logs, thereby creating a non-provisionable snapshot. At the completion of the initial load a second SnapSync that will retrieve logs will start. For more information, view the <a href="#">KB article</a></p>

Setting	Explanation
LogSync Policy Settings	<p>LogSync Policy Settings are available after the dSource has been added. On the Configuration page, you can select the following options:</p> <ul style="list-style-type: none"> <li>• Enabled - LogSync fetches log files from the source database, enabling the ability to provision a VDB from a specific point in time or, a database change number (SCN in the case of Oracle databases). LogSync must be enabled for this provisioning functionality to work.</li> <li>• Archive Only, Archive and Online Redo - these settings determine whether LogSync fetches logs from archive storage in the source database file system, or both the file system and online redo logs. Online Redo mode is not supported for physical standby or RAC databases. It is also not supported if the online redo logs are raw devices or Oracle Automatic Storage Management devices. If LogSync detects any of the restricted cases it will automatically enter into Archive Only mode, regardless of the mode that was chosen. Additionally, Online Redo mode is not supported for mounted but not open primary databases.</li> </ul> <p>LogSync policy settings for Oracle pluggable databases must be set at their corresponding container databases.</p>
Validated Sync	<p>Oracle validated sync is disabled by default. When enabled, validated sync is performed immediately after every subsequent SnapSync. See <a href="#">Enabling Validated Sync for Oracle</a> for more information.</p> <div style="background-color: #e6e6fa; padding: 10px; border: 1px solid #d1c4e9;"> <p> Validated sync for Oracle pluggable databases is not supported in this release</p> </div>

### Snapshot parameters

There are also parameters you can specify when creating a snapshot of an Oracle data source. These parameters are explained in the table below.

Parameter	Explanation
Force Full Backup	The Delphix Engine will by default perform an incremental backup, if for some reason a full backup is required (most often to resolve issues with datafile corruption), this option should be used.
Double Sync	<p>Double SnapSync, or DoubleSync, takes two snapshots sequentially in order to improve the performance of subsequent operations, such as VDB provisioning and refresh.</p> <p>Performs the initial load without retrieving any archived logs, thereby creating a non-provisionable snapshot. At the completion of the initial load a second SnapSync that will retrieve logs will start. For more information, view the <a href="#">Using the Double Sync option for Oracle SnapSync</a></p>

Parameter	Explanation
Do Not Resume	During the initial SnapSync, if a failure is encountered, the Delphix Engine can resume the SnapSync at a later date, this option will cause the engine to not resume, but rather to start the initial SnapSync over again.

## Prepare and upgrade a Non-MT Oracle dSource to MT

### Overview

This article describes how Delphix works with production databases that are converted from non-multitenant to multitenant, and the workflow for this operation. Once a dSource is converted to a multitenant PDB, it will be able to share storage blocks with its non-multitenant predecessor, and Delphix will only store the incremental changes to the database. This operation is known as STConvertedToPDBAttach and is only available via CLI.

### Environment requirements

1. Delphix Engine 6.0.10.0 or later.
2. Source host with a 11g or 12c non-multitenant source database.
3. PDB that is created as a result of converting the above non-multitenant database to multitenant. This PDB can reside on a different host.
4. Source host with a CDB that hosts the above PDB.

### Workflow steps

At the end of the steps below, there should be 2 containers:

- The detached non-MT container which contains all the non-MT snapshots.
- A new container representing the converted PDB and all its subsequent snapshots with the container name as the PDB name. By default the new MT container will have the name of the PDB, or a parameter can be set by the customer to specify its name during attach.

Use these steps to perform this functionality.

1. Link the non-multitenant Oracle 11g or 12c source database as a dSource within Delphix. Please note, 11g sources Patch 31220011 included in the July 2020 bundle is needed and XML must be installed to the DB.
2. Before performing the conversion to multitenant, detach the dSource and shut it down. Visit the [Detach/Re-Attach Oracle dSource](#) article for this step and step 7.
3. Convert the non-multitenant database to a PDB following procedures provided in the Oracle documentation. Delphix recommends that the new PDB have the same name as the original non-multitenant database. The new CDB name should be different from the original non-multitenant database.
4. Discover the CDB in Delphix Engine if not already present.
5. Refresh the environment to make sure the new PDB is discovered.
6. If the PDB name has the same name as the non-multitenant then the old non-MT container can be renamed or a parameter to give a different name to the PDB database should be used.
7. Attach converted PDB to non-multitenant dSource using CLI (attach-converted-pdb sample script).

#### **Converted PDB rules BEFORE SnapSync**

- Attachment of a converted PDB does not perform automatic SnapSync, even if linkNow=true is used. This is to allow detachment of a converted PDB without negative effects on a non-MT container.
- If for any reason it is necessary to re-convert the PDB (after re-opening to the non-MT database to perform changes), then the converted PDB should be removed instead of detached so that the STConvertedToPDBAttach can be done again to save space.
- Once the converted PDB is removed without performing SnapSync on it, it is possible to attach the non-MT container to its non-MT database.

#### **Converted PDB Detach vs. delete BEFORE SnapSync**

- Detaching a converted PDB will make it possible to attach the non-MT container to its non-MT database.
- However, if the non-MT database is reconverted and regular attach is used to attach the PDB, there will be no space de-duplication since the detach operation reverted the changes as it was before the STConvertedToPDBAttach operation.
- Detach of a converted PDB and subsequent attach should only be performed as long as the PDB has not been re-created/re-plugged to obtain space de-duplication.
- In general a converted PDB should be removed if no SnapSync is taken.

#### **📘 Converted PDB rules AFTER SnapSync**

- Once a SnapSync is taken of a converted PDB, the non-MT container cannot be re-attached to any other container (neither to a non-MT database or to a converted pdb).
- This means that once SnapSync is taken, the non-MT container cannot be used to attach to a converted PDB anymore.
- Even if the converted PDB is removed after taking a SnapSync, attaching to the non-MT container will not be possible as the non-MT container is marked as already converted.

#### AttachSource/data properties

These are all the possible properties that can be configured during the attach of a converted PDB. Of these, only newPdbContainer and force have special meaning for a converted PDB. The rest are 'regular' attachment options.

```
machine.name database 'DBOMSR' attachSource attachData *> ls
Properties
  type: OracleSTConvertedToPDBAttachData (*)
  backupLevelEnabled: (unset)

#### attach-converted-pdb sample script

```
cd /database
select mydatabase
attachSource
edit attachData
set type=OracleSTConvertedToPDBAttachData
```

```
set newPdbContainerName=<name for the container instead of PDB name>
set config=<converted PDB name>
edit oracleFallbackCredentials
set type>PasswordCredential
set password=<database login password>
back
set oracleFallbackUser=<database login username>
set environmentUser=<environment user>
commit
```

## Repository templates for Oracle databases

The primary use case and motivation for repository templates are to provide the Delphix administrator with control over the Oracle database parameters used during the staging phase of the VDB provisioning process. It is useful to be able to control these configuration parameters when the physical capabilities of the staging machine, such as CPU count and memory, are smaller than the physical capabilities of the machines hosting the source database repository.

The repository template is a relationship between three entities:

- A database repository – It is the Oracle home to which the vPDB will be provisioned on the target host.
- A database container – It is the source PDB.
- A VDB configuration template – A list of database configuration parameter names and values that you can save on the Delphix Engine to use at a later time. The VDB configuration template for the temporary CDB must contain at least the following database parameters:
  - **compatible**: Required for both Non-Multitenant and Multitenant sources. Must be set with the same value as in the dSource 'compatible' parameter.
  - **enable\_pluggable\_database**: Required for Multitenant sources only. Must be set to TRUE.

During the staging process, if you do not specify a repository template, then by default, the Delphix Engine will use the configuration parameters taken from the source database to configure the staged database. These parameters may not be appropriate, because the machine used for staging may be physically inferior to the machine hosting the source database.

Instead, the Delphix administrator can create a VDB configuration template, which would be appropriate for the physical machine hosting staging repository. (See [VDB Config Templates](#)) Then the admin can create a repository template entry that will bind together the VDB configuration template, database repository, and database container. This instructs the Delphix Engine to use configuration parameters from the VDB configuration template whenever the database container is staged on the database repository specified, instead of the parameters on the source database.

Currently, repository template relations can only be created via the command-line interface (CLI) in the repository > template.

### Provisioning a VPDB using a Repository Template

Perform the following procedure to provision a VPDB using a repository template.

1. Create a VDB configuration template using the Delphix GUI called `aux_cdb_params` with the following parameters set as a bare minimum.

```
compatible = 12.1.0.2
enable_pluggable_database = true
sga_target = 1551892480
```

The parameters required may differ given a specific environment's requirements from this but this should allow the startup of the auxiliary database.

2. Create a repository template called `aux_cdb_tmpl` using the CLI.

```
delphix repository template> create
delphix repository template create *> set name=aux_cdb_tmpl
delphix repository template create *> set container=PDB12C1
delphix repository template create *> set repository=OELC9/'/u01/app/oracle/
12.1'
```

```
delphix repository template create *> set template=aux_cdb_params
delphix repository template create *> commit
```

```
delphix repository template 'pb12c1rt'> ls
Properties
  type: SourceRepositoryTemplate
  name: aux_cdb_templ
  container: PDB12C1
  reference: REPOSITORY_TEMPLATE_REF-4
  repository: OELC9/'/u01/app/oracle/12.1'
  template: aux_cdb_params
```

In the above example:

- a. **name** is what you want the template name to be.
  - b. the **container** is the source PDB.
  - c. the **repository** is the target environment/ORACLE\_HOME that the CDB target is running from.
  - d. the **template** is the name of the database template created in the GUI.
3. Provision a virtual pluggable database (VPDB) via the Delphix GUI using the source PDB defined as the container in the repository template and provision the VPDB to the target environment defined by the repository (target environment/Oracle Home combination) in the repository template.

## Using the PurgeLogs operation

This topic addresses scenarios in which the purgeLogs operation is used to clear expired and unused logs.

Log retention does not affect the logs in the following three cases:

- If the logs are expired but are required for snapshots to be consistent
- Logs generated after the most recent snapshot
- Logs required to make retention-proof bookmark points provisionable

It is possible that the storage space is not freed by retention. In this scenario, there is only one snapshot and under that circumstance, it would continue to generate logs to the point that there was no storage space available. This prevents new snapshots from being taken. Additionally, retention does not delete expired logs that are required for snapshots to be consistent.

 The purgeLogs operation does not function for CDBs or any non-Oracle data platforms at this time. In addition, this operation only functions for Oracle non-multitenant dSources, it does not function with VDBs.

Possible strategies

**Strategy 1:** It deletes all the expired logs associated with snapshots as required until the target space to reclaim is achieved. It deletes the oldest snapshot logs and moves to the newest one in order for each Timeflow starting from the current Timeflow first. The logs required for retention proof bookmarks and pinned snapshots are not deleted.

**Strategy 2:** It deletes logs beyond the last snapshot to free up space in which retention cannot free. Deletion is done in this order as opposed to deleting from the oldest logs because of the possibility of Timeflow repair at a later time. The deletion is done based on the actual compressed file size of the log sequence on the Delphix Engine. If there is a retention proof bookmark, this operation preserves the logs required to provision from the retention proof bookmark. This operation also spares the online in-flight log sequence since chunks of this sequence will keep coming in (this only applies for logsync mode set to Archive + Online Redo).

PurgeLogs operation takes three arguments :

**storageSpaceToReclaim** - This takes a non-zero amount of space to reclaim (eg; 20K, 5M etc). This is the target amount of space that the user will want to free up. This will be dependent on whether there will be enough objects to be freed. By default, **Strategy 2** is always in effect. The user has the ability to run **strategy 1** if their target space reclaim is not met, the user can run **strategy 1** using the **deleteSnapshotLogs** argument.

**deleteSnapshotLogs** - This is set to false by default. If this is set to true, then logs are deleted based on **strategy 1**. Even after completing that, if the target storage space to reclaim is not achieved, then logs are deleted based on **strategy 2** until the target is achieved or there are no more logs to delete. If this is set to false, then deletion is done based on **strategy 2** only.

**dryRun** - This is a boolean argument and set to true by default. If it is true, then the operation does not actually delete the logs. This argument can be used to see which snapshots and parts of the Timeflow will be affected by the operation. This operation returns the time flow point beyond which logs might be deleted and the set of snapshots affected by this operation (and will not be provisionable afterwards). When the operation is run in non-dryrun mode, we compute the time range of the snapshot and provide the endpoint as the end of the truncated Timeflow. In dryrun mode, we return the endpoint of the first log which survived as the Timeflow point beyond which it has been truncated.

 • Use this operation with `setopt format=json`, otherwise, the list of snapshots may be truncated if there are more than 3.

- Step 7 is an optional step and to be used in the event **Strategy 2** does not clear enough space desired by the user. Please note that any snapshots affected by this step enabled can no longer be provisioned from. The user will be required to restore archivelogs to re-enable provisioning of the affected snapshot. To repair this function please use the TimeFlow Repair Tool.
- VDB transaction logs can be manually removed from the **archive** filesystem mounted on the target for each VDB.

This example shows how to free 9K of space from container "example\_container" using strategies 1 and 2:

1. Log into the CLI
2. Go to the container using `/database`
3. Set the output format into json using this statement: `setopt format=json`
4. Select the container using `select example_container`
5. Select operation `purgeLogs`
6. Set the target space to reclaim to 9K using `set storageSpaceToReclaim=9K`
7. **(Optional Step)** `deleteSnapshotLogs=true` . **Warning:** this step should be used only in the event that Strategy 2 does not free enough space. This will remove the ability to provision from affected snapshots or require the restoration of archivelogs to enable provisioning. Use `set dryRun=true` to run operation and view the snapshots which will be affected. Affected snapshots will be listed under the section `affectedSnapshots` .
8. Use `set dryRun=false` to enable the operation.
9. `Commit` operation

The output should look like this:

```
delphixengine> /database
delphixengine database> select example_container
delphixengine database "example"> purgeLogs
delphixengine database "example" purgeLogs *> set storageSpaceToReclaim=9K
delphixengine database "example" purgeLogs *> set deleteSnapshotLogs=true
delphixengine database "example" purgeLogs *> set dryRun=false
delphixengine database "example" purgeLogs *> commit
  type: PurgeLogsResult
  affectedSnapshots:
    0:
      type: OracleSnapshot
      name: '@2014-08-05T23:29:57.576Z'
      consistency: INCONSISTENT
      container: dbdhcp3
      creationTime: 2014-08-05T23:29:57.576Z
      firstChangePoint:
        type: OracleTimeflowPoint
        location: 2825963
        timeflow: dbdhcp3/default
        timestamp: 2014-08-05T23:31:15.000Z
      latestChangePoint:
        type: OracleTimeflowPoint
        location: 2826079
        timeflow: dbdhcp3/default
```

```
timestamp: 2014-08-05T23:31:15.000Z
missingNonLoggedData: false
namespace: (unset)
reference: ORACLE_SNAPSHOT-75
retention: 0
runtime: (unset)
timeflow: dbdhcp3/default
timezone: America/New_York,EDT-0400
version: 11.2.0.2.0
truncatePoint:
  type: OracleTimeflowPoint
  location: 3176794
  timeflow: dbdhcp3/default
  timestamp: 2014-08-07T19:58:55.000Z
```

This output shows that the affected snapshot is '@2014-08-05T23:29:57.576Z' and the snapshot will not be provision-able. The truncate point indicates the last SCN/timestamp that can be provisioned.

## Advanced linking
